A fortnight after the incident just related, with the early dawn of day a large crowd of people was seen assembled before Panolfo's house. Every one was pointing towards it, or clapping his hands, and asking the name of the painter, who had erected as a sign the magnificent picture of the Martyrdom of St. Bartholomew; which had been fixed to the balcony overnight, and denuded of its covering with the approach of daylight. The enthusiasm of the throng now manifested itself in vehement clamour, and now in still admiration, mingled with a feeling of the deepest horror. The saint was depicted lying on his left side. His feet were tied together, and held by one of his executioners; his right arm, which was drawn up perpendicularly to his head, had already received a gash, and the other torturer, with a Satanic smile in his bloodthirsty visage, thrust his hand with as much callous composure into the wound, between the bleeding flesh and lacerated skin, as a butcher that has seized the animal he is going to slay; while the face of the victim expressed, in a wonderful manner, his resignation and his faith in the eternal reward promised to the martyr, and his silent conquest thereby over pain and torture. Never has such a subject found such an expounder; never did pencil attain in so high a degree to expression and power.

The news had soon spread over the whole town, and the crowd assembled in the grand square grew so large at last, that the viceroy himself became anxious to know the reason of the concourse. Accompanied, therefore, by Octavio and other favourites, he repaired to the spot opposite the merchant's house, and, seized with astonishment and admiration at the sight, "Who painted this masterpiece?" he cried. No one was quick in answering him. "Why does the artist conceal himself?" continued Monterci. "Let him show himself, and depend upon my protection. All the painters of Naples shall go and be schooled by him. Once more, whose master-work is this?"

"Mine," cried Ribera, stepping forth from the crowd.

"Who art thou?"

"My name is Ribera; I am here unknown, and only wait to be that which it may please your highness to make of me."

"What reward dost thou require?"

"The title of First Painter to the Viceroy of Naples."

"Be it so. How much hast thou received for this picture?"

"Sire, the merchant Panolfo offered me twenty-five ducats for it, but I rejected them. However, he can content me another way: I love his daughter Laura."

"To-morrow ye shall be united."

The union of the two lovers took place on the following day. Ribera, better known by the name of Espagnioletta, in a short time became the most celebrated painter in Naples, and soon eclipsed all those who, jealous of the Count of Monterci's favour, or fearful of their rival's superiority, had so long obstructed his path to fortune and to fame. But Panolfo, who had most cordially given his consent to his daughter's union with Ribera, never let a day pass without boasting that he had been the first to recognise the genius of his son-in-law.

The Martyrdom of St. Bartholomew now forms part of the Parisian collection of the paintings of the Spanish school. Mr. Taylor's passionate love of the fine arts deprived the cabinets of Spain of this magnificent gem, in order to confer it upon France. Every one may there convince himself that the praise which we have lavished on the picture, far from being exaggerative, is really less than its real merits demand; and the

Parisian public has already expressed its enthusiastic admiration of the work in similar terms to the acclaim of Naples two hundred years before.

DESCRIPTION OF AN OLD-FASHIONED GARDEN.

I MAY, perhaps, have spoken more feelingly on this subject (the defects of modern gardening), from having done myself what I so condemn in others—destroyed an old-fashioned garden. It was not, indeed, in the high style of those I have described, but it had many circumstances of a similar kind and effect. As I have long since perceived the advantage which I could have made of them, and how much I could have added to that effect—how well I could in parts have mixed the modern style, and have altered and concealed many of the stiff and glaring formalities, I have long regretted its destruction. I destroyed it, not from disliking it; on the contrary, it was a sacrifice I made against my own sensations to the prevailing opinion. I doomed it, and all its embellishments, with which I had formed such an early connexion, to sudden and total destruction, probably much upon the same idea as many a man of careless, unreflecting, unfeeling good nature, thought it his duty to vote for demolishing towns, provinces, and their inhabitants in America: like me—but how different the scale and the interest!—they chose to admit it as a principle, that whatever obstructed the prevailing system must be all thrown down, all laid prostrate, no medium, no conciliatory methods were to be tried, but, whatever might follow, destruction must precede.

I remember, that even this garden, so infinitely inferior to those in Italy, had an air of decoration and of gaiety, arising from that decoration: *un air paré*, a distinction from mere unembellished nature, which, whatever the advocates of extreme simplicity may allege, is surely essential to an ornamental garden. All the beauties of undulating ground, of shrubs, of verdure, are to be found in places where no art has ever been employed, and, consequently, cannot bestow a distinction which they do not possess; for, as I have elsewhere remarked, they must themselves, in some respects, be considered as unembellished nature.

Among other circumstances, I have a strong recollection of a raised terrace, seen sideways from that in front of the house, in the middle of which was a flight of steps with iron rails, and an arched recess below it, backed by a wood. These steps conducted you from the terrace into a lower compartment, where there was a mixture of fruit-trees, shrubs, and statues, which, though disposed with some formality, yet formed a dressed foreground to the woods; and, with a little alteration, would have richly and happily blended with the general landscape.

It has been justly observed, that the love of seclusion and safety is not less natural to man than that of liberty, and our ancestors have left strong proofs of the truth of that observation. In many old places there are almost as many walled compartments without, as apartments within doors; and, though there is no defending the beauty of brick walls, yet still, that appearance of seclusion and safety, when it can be so contrived as not to interfere with general beauty, is a point well worth obtaining; and no man is more ready than myself to allow, that the comfortable is a principle which should never be neglected. On that account, all walled gardens and compartments near a house,—all warm, sheltered, sunny walks, under walls planted with fruit-trees,—are greatly to be wished for, and should be preserved if possible, when once established. I therefore regret extremely, not only the compartment I just mentioned, but another garden immediately beyond it; and I can-

not forget the sort of curiosity and surprise that was excited after a short absence, even in me, to whom it was familiar, by the simple and common circumstance of a door that led from the first compartment to the second, and the pleasure I always experienced on entering that inner and more secluded garden. There was nothing, however, in the garden itself to excite any extraordinary sensation: the middle part was merely planted with the lesser fruits, and dwarf trees; but, on the opening of the door, the lofty trees of a fine grove appeared immediately over the opposite wall; the trees are still there, they are more distinctly and openly seen, but the striking impression is gone. On the right was another raised terrace, level with the top of the wall that supported it, and overhung with shrubs, which, from age, had lost their formality. A flight of steps of a plainer kind, with a mere parapet on the sides, led up to this upper terrace underneath the shrubs and exotics.

All this gave me emotions in my youth, which I long imagined were merely those of early habit; but I am now convinced that was not all; they also arose from a quick succession of varied objects, of varied forms, tints, lights, and shadows; they arose from the various degrees of intricacy and suspense that were produced by the no less various degrees and kinds of concealment, all exciting and nourishing curiosity, and all distinct in their character from the surrounding landscapes. I will beg my reader's indulgence for going on to trace a few other circumstances which are now no more. These steps, as I mentioned before, led to an upper terrace, and thence through the little wilderness of exotics, to a summer-house, with a luxuriant Virginia creeper growing over it; this summer-house and the creeper, to my great sorrow at the time, to my regret ever since, to my great surprise at this moment, and, probably to that of my reader—I pulled down, for I was told that it interfered so much with the levelling of the ground, with its flowing line and undulations, in short, with the prevailing system, that it could not stand. Beyond this again, as the last boundary of the garden, was a richly worked iron gate, at the entrance of a solemn grove; and they both, in no small degree, added to each other's effect. This gate, and the summer-house, and most of the objects I have mentioned, combined to enrich the view from the windows, and from the home terrace. What is there now? grass, trees, and shrubs only. Do I feel the same pleasure, the same interest in this ground? Certainly not. Has it now a richer and more painter-like effect as a foreground? I think not by any means; for there were formerly many detached pieces of scenery, which had an air of comfort and seclusion within themselves, and at the same time formed a rich foreground to the near and more distant woods, and to the remote distance.

The remark of a French writer may very justly be applied to some of these old gardens:—"*L'agréable y étoit souvent sacrifié à l'utile, et en général l'agréable y gagna.*" All this, however, was sacrificed to undulation of ground only, for shrubs and verdure were not wanting before. That undulation might have been so mixed in parts with decorations and abruptnesses, that they would have mutually added to each other's charms; but I can now only lament what it is next to impossible to restore, and can only reflect how much more difficult it is to add any of the old decorations to modern improvements, than to soften the old style by blending with it a proper portion of the new. My object (as far as I had any determinate object besides that of being in the fashion) was, I imagine, to restore the ground to what might have been supposed to be its original state; I probably have, in some degree, succeeded, and, after much difficulty, expense, and dirt, I have made it look like many other parts of mine, and of all beautiful grounds, with but little to mark the difference between what is close to the house and what is at a distance from it, between the habitation of man and that of sheep.—*Sir Uvedale Price, on the Picturesque.*

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

LINES ADDRESSED TO AN ENGLISH LADY,

Who had offered the Writer a small branch of ivy from Spenser's Oak, on condition that she would present her with some stanzas in exchange.

META.

I CRAVE it not! Oh! bear to Britain's isle
This green memorial of her poet son;
Thine was the land which hailed his infant smile;
Thine be this token of the gifted one!

I crave it not! we dare not claim as ours
Him who hath sung in his undying lays
Of lovely ladies in enchanted towers,
Of knights and giants, demoisels and fays.

But yet, perchance, his glowing spirit caught
Some inspiration from our mountain air;
And these bright visions which his fancy wrought,
Softened the twilight of his long despair!

The exile's heart! oh, who can tell its woe?
Fixed, sharp, and changeless through our lengthening years,
The yearning pang—the grief consuming slow,
The full deep sorrow swelling forth in tears!

The exile's heart! O Spenser! such was thine,
Till Fancy came to lighten half thy pain;
Showed thee the wonders hid beneath her shrine,
And named thee foremost in her glittering train.

Her voice the spell which bade thy numbers flow;
Her smile thine earliest and best reward,
As 'neath thine oak, with head reclining low,
Thy languid limbs lay stretched upon the sward.

Thine aged oak! The changeless ivy binds
Those giant arms now crumbling with decay,
And mutely thus the wanderer reminds
How greatness lingers e'er it pass away!

Oh, take the wreath—we never claimed as ours
The poet son thine own proud Albion lent;
Restore the chaplet to those leafy bowers
Where his young days of happiness were spent!

But oh! my friend, when others harshly speak,
Tell them of hearts still noble and still true;
Still let thy sympathies their sorrows seek—
Erin find an advocate in you!

And as the ivy oft adorns the stem
Of some old mouldering, yet honoured thing,
So let thy love our few frail virtues gem,
And o'er our many faults its mantle fling.

THE YELLOW LEAF.

HENRY J. JOHNS.

THE yellow leaf!—the yellow leaf!
Hath shed upon the woods, again,
A radiance beautiful, but brief,—
A seeming glory, though a stain!
And lo! what tints, of roseate blush,
Amid the clustering foliage glow,
As if, on every tree and bush,
Another Spring were lighting now!
Ah! trust not that alluring hue!
The bloom on Autumn's fading wreath
Is but a hectic flush—too true—
The herald of decay and death!
The spoiler thus permits, awhile,
On beauty's cheek the rose to glow,
But plies, beneath the insidious guile,
With treacherous stealth the work of woe!
The yellow leaf! the fading leaf!
In brightness clad, but frail as fair,
Proclaims a tale of seasons brief,
And bids thee, thoughtless MAN, prepare!

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—Montaigne.

BREAD.

A Method of saving one-third of wheaten flour, and about 23 per cent. in price, in the manufacture of Bread.

HOMONY is produced from Indian corn. It is the corn coarsely ground, or kibbled, and is thus distinguished from Indian meal flour, which is finely ground. It is sold by provision merchants, at from 20l. to 22l. per ton, or about 22s. a cwt., if with the addition of carriage (1l. per hundred miles), the cost, as nearly as can be calculated, would be 24d. a lb.

Homony has the quality of imbibing from five to seven times its weight of water, which Indian meal flour does not; and this constitutes the important distinction between the two.

The proportion of homony and seconds wheaten flour for good bread is 1½ lbs. of homony to a stone (14lbs.) of flour.

The homony must be soaked sixteen or eighteen hours in cold water before it is cooked.

To make Homony Bread.

The homony having been properly soaked, drain off the water, and add fresh water seven and a half pints for each pound and a half of homony as weighed before soaking; let this simmer for four hours (if boiled rapidly it will become hard and never swell), the homony will then be fit for stirabout or bread. For bread, mix it gradually with the flour, making the dough in the ordinary way, and adding yeast in rather more than the usual proportion.

This bread will keep moist and good for a longer time than if made entirely of wheaten flour.

Cost.

Of 14lbs. of seconds flour	} 3s. making 16lbs. of bread.
Of 14lbs. of seconds flour (3s.) and 1½ lbs. of homony (4½ d.)	
	} 3s. 4½ d. making 23½ lbs. of bread.

The cost of bread made of seconds flour is, therefore, nine farthings per pound, and of flour with homony, seven farthings per pound, which is a saving of nearly twenty-three per cent. upon the homony bread; and as the homony has swelled to 7½ lbs. and the flour to 16lbs. the bread is formed of as nearly as possible ¾ wheaten flour, and ¼ homony flour.

(1) For the information of those persons who may not know where to obtain Indian corn, we refer them to Mr. H. Taylor, 112 and 113, Tooley Street, London; or to Messrs. Martin and Co., Rainhill, Liverpool.

N.B.—A Stamped Edition of this Periodical can be forwarded free of postage, on application to the Publisher, for the convenience of parties residing at a distance, price 2s. 6d. per quarter.

German Peasant tending Cattle.

The above sketch represents a mode of tending cattle frequently to be met with in the more remote parts of Germany, where enclosures are not common, and the pasture-lands of the peasantry are not separated from each other and from the corn-fields by regular fences. In the sketch a cow and goat are tied together by a long rope fastened around the horns of each, which a girl holds in the middle, and so prevents either from straying.

A VISIT TO THE NEW HOUSES OF PARLIAMENT.

ONE bright autumnal evening in 1834, towards the fashionable dinner-hour, the indwellers of the metropolis were alarmed by the breaking out of a "conflagration" upon the northern bank of the river, at a spot perhaps dearer in association than any other to every reader of England's history. The wind blew briskly from the south-west; the flames shot up with fearful rapidity; and the crowds of people who clustered upon the bridges and banks soon ascertained the scene of the "great fire" to be the Houses of Parliament at Westminster. "The wind blew briskly from the south-west, but became more southerly as the night advanced; the moon was near the full, and shone with radiance; but occasionally vast masses of cumulus floated high and bright across the skies, and, as the fitful glare of the flames increased, were illumined in a remarkably impressive manner, which gave interest to the busy scene that was preparing below."

The circumstances of the discovery of the fire we will relate as briefly as possible. At about 6 o'clock, the wife of one of the door-keepers, seeing a strongly glittering light under one of the doors, immediately ran to the deputy house-keeper, exclaiming, "Oh, good God, the House of Lords is on fire!" The persons employed about the building were quickly drawn together by the alarm; and a chimney was observed to be "very much on fire." The wind increased in strength; the flames shot through the numerous wood-panelled passages, lobbies, staircases, &c., which formed the communication between the two houses and their offices; and, "in a few hours," says one of the accounts, "notwithstanding all the aid which could be furnished by fire-engines and fire-men, by working parties of soldiers and labourers, and by the assistance of the police, as well as from the voluntary services of many other persons, including both noblemen and gentlemen (Members of Parliament), the Houses of Lords and Commons and the Painted Chamber were consumed to the bare walls, whilst the more fragile buildings immediately surrounding them were altogether destroyed."

Throughout the night the scene of the fire presented a spectacle strikingly picturesque and impressive. The flames threw a lurid glare upon the fair bosom of the Thames, as well as upon the thousands of spectators crowded in boats and barges and upon the bridges and banks; at the same time that the atmosphere was lit up for many miles around the metropolis. Landward, the progress of the fire exhibited a *tableau vivant* of not inferior interest. The Old Palace Yard, and, in the adjacent avenues, the soldiery, in their glittering uniforms, the shouts of the firemen and the clangour of the working engines; the rush and roar of the reckless mob, and their yelling, amounting almost to savagery, alike as the flames were checked or fed in their intensity, are even now

"Life, and perfect in our listening ear."

In justice we should observe that the interest attached to the greater portion of the buildings in course of destruction was but understood by comparatively few of the congregated thousands; but every one present must have felt concerned for the fate of the magnificent hall, around which the flames raged fearfully during a considerable part of the night. Happily, the scene of the coronation feasts of our sovereigns for centuries past was preserved unscathed, but not until three o'clock on the following morning was the fire sufficiently subdued to remove apprehensions of further danger.

Next day, the blackened ruins presented a strange reality of a prophetic intimation as to the actual consequence in case of fire, put by Sir John Soane, in the year 1828; who, contemplating the labyrinth of lath

and plaster, which the old buildings presented, observed, "in such an extensive assemblage of combustible materials, should a fire happen, what would become of the Painted Chamber, the House of Commons, and Westminster Hall? Where would the progress of the fire be arrested?"

The cause of the fire was, in a few days, traced to the burning of about two cart loads of wooden tallies, in the furnaces or stoves connected with the flues, which passed beneath the flooring of the House of Lords; the iron pipes and flues by this means became red-hot, and set fire to the floor, as combustible as touch-wood. The tallies, we should explain, were notched wooden sticks, used until October, 1826, in keeping the public accounts of the Treasury; and in destroying the relics of this ancient mode of reckoning, nearly the entire pile of buildings and offices was destroyed; a result which may with propriety be added to the long list of "great events from little causes."

We have alluded incidentally to the historical interest of the great scene of devastation—"the Palace at Westminster," the residence of our monarchs from Edward the Confessor to Elizabeth, who was its last sovereign inhabitant. After her death the court resided at Whitehall and St. James's; and, as the ancient buildings of Westminster Palace fell into decay, they were removed; or, restored, and converted to other uses. Not only, however, had the Palace been in the long lapse of five centuries and a half a royal residence, but it was the seat of administrative justice, and the domestic government of the kingdom, for nearly eight centuries; or, from the Anglo-Saxon period to the date of the great fire, in 1834. Hence, the system of a great plan of the palace buildings included, besides the "proper house and home" of the Sovereign, the house of prayer, wherein many a ruler knelt to the service of the Most High; and around were clustered the courts of justice, in accordance with the spirit of a feudal age. Upon no other spot of the country would the influence of historical association appear to have been so powerfully concentrated as upon the site of the Westminster Palace. There, amid the smoking ruins, on the morning after the fire, stood the massive walls of "the Painted Chamber," believed to have been the bed-room of Edward the Confessor, and the scene of his last hours. There, too, happily saved from the flames, was the Hall, the vast state room of the palace, founded by William Rufus, though he was discontented therewith—"it was so lylite." Among the salvage, likewise, was the old Court of Requests, where, in the feudal times, sat the officers authorized to receive petitions of the subjects for justice, or favour from the king. This building had been long used as the House of Peers; whilst the Commons sat within the walls of a splendid chapel, reputed to have been founded by King Stephen, and unquestionably begun to be rebuilt by Edward I., and completed by Edward III. Hence, it belonged to the best age of our architecture: the legislators sat in a timber-structure built within the chapel walls, and the flames of 1834, by destroying the unsightly wooden fabric, (less than half a century old,) laid bare the elegant tracery of the windows, the gorgeous painting, gilding, and sculpture of the walls, and the noble proportions of the crypt; the richly dight skeleton standing amidst the general wreck, a picturesque ruin, and an impressive memorial of the piety of our ancestors, in an age when men vied in the practice of beautiful art to glorify their Maker.

With all this *prestige* in its favour, it is not surprising

* The Exchequer at Westminster, the most ancient revenue department of the state, with all its complicated machinery of tallies and checks, was not entirely abolished until the year 1834; when a new office for the purpose was opened at the Bank of England. The *tally* was a stick about twenty-two inches in length; in its edge were cut notches to denote the reckoning; and a counter-tally was stripped off, cutting the date line of the transaction; so that identity consisted not only in the wood fitting, but in the halved date and notches corresponding, like a halved bank-note.

to find the rebuilding of the Houses of the Legislature upon the original site, a resolution of almost self-angstion. The objectors were but few: its lowness was urged as a plea for change; but the "divinity" which hedged the Confessor's chamber, the chapel, and the great hall, proved of paramount influence. Temporary accommodation for the sitting of "the Houses," was provided among the ruins of the fire; but many months elapsed before the plan for rebuilding was matured. This being decided on, ninety-seven sets of designs were furnished in four months; and Mr. Barry was, at length, selected as the successful competing architect, in the spring of 1836. The several designs were publicly exhibited; and well do we remember the elaborate beauty and richness of Mr. Barry's drawings: indeed the vast superiority of his design, bating foregone conclusions, was evident to the most unprofessional eye. It was, in some respects, different from the structure as yet completed; but the variations need not here be pointed out, further than by stating that the general character of the design was more castellated than the portion built. With the year 1839 was commenced the excavation for the river wall; and the building of the wall in March. In 1840, the Speaker's House and Parliamentary Offices were begun; but, it was not until the middle of 1841, that any important progress had been made in the superstructure.

The New Houses may be described, in plan, as a vast assemblage of buildings, with the intervening courts, covering an area of nine statute acres, with a frontage to the Thames of nearly one thousand feet. In the centre of the plan is a large octagonal hall, communicating, by a corridor and lobby, northward with the House of Commons, and southward with the House of Lords. In a line with the latter is the Victoria Hall and Gallery, for the royal entrance by the Victoria Tower, at the south-west angle of the plan. Flanking the "Houses" and offices are eleven large open courts; St. Stephen's Hall, and the crypt of old St. Stephen's, to be used as a chapel for Divine worship; and old Westminster Hall will form a grand vestibule of entrance to the entire pile. It will comprise fourteen halls, galleries, vestibules, and other apartments, of great capacity and noble proportion; and eight official residences, each a first-rate mansion, that for the Speaker being as large as the Reform Club House. The space between the principal apartments is occupied by open courts, and corridors and lobbies, besides libraries, waiting-rooms, &c. In the river front is a central conference hall, with committee-rooms and libraries for the Lords and Commons, Speaker and Black Rod Usher's apartments, &c.; the whole plan numbering between five and six hundred distinct rooms. The principal external features will be the Victoria Tower already named, now built to the height of ninety feet, and to be raised to four hundred feet; the Clock Tower, at the Westminster Bridge end; and the tower of the octagon or Central Hall; besides the towers in the river front. The exterior is of hard magnesian limestone, from Bolsover, in Nottinghamshire; and the interior of Caen stone. The main beams and joists are of iron throughout, and the several buildings are fire-proof. The style of the architecture is florid Gothic: we have not, however, space to detail its picturesque enrichments—its canopied niches with statuettes of crowned sovereigns, mitred churchmen, and sainted women; its thirty-five shields of arms of the sovereigns of England; its multitudinous badges, religious and loyal inscriptions; its richly gilt wind vanes, and erect-tiles, noble windows, massive arches, and the numberless embellishments with which the whole pile may be said to bristle. The style employed may be best described in the architect's own words:—"It has been his aim to avoid the speculative, collegiate, castellated, and domestic styles, and to select that which he considers better suited to the peculiar appropriation of the building."

Having thus glanced at the leading features of the plan, we shall proceed to describe, from our own careful inspection, the portion of the design already completed—the artistic nucleus of the superb and stupendous whole.

THE NEW HOUSE OF LORDS.

Externally, the House presents no enriched architectural features. As seen from the House Court, the exterior shows a low and boldly embattled portion, resting upon an arcade of flattened arches: this, on each side, serving as the corridor of the House. Above this, the six finely proportioned and traceried windows of the House are seen; and, between each, a plain, massive buttress; the whole crowned with lofty battlements.

The public have been admitted by thousands to inspect these finished portions, which consist of the House itself, the lobby to the same, the Victoria Hall, and the corridors on each side of these apartments. These corridors are handsomely panelled and ceiled with oak; the windows are square-headed, divided by mullions, and traceried; the glass is richly diapered; and in labels, running diagonally, the motto "*Dieu et mon droit*," is many times repeated. At night, these corridors are lighted by gas in branches, and globe lights pendent from the ceiling. They have doors opening into the House, with plate-glass panels.

The chief entrance to the House is by

THE PEERS' LOBBY.

This is a large and lofty square apartment, each side being divided into a wide central, and two smaller compartments, by buttresses, panelled and enriched, and crowned with demi-angels, bearing shields, with the Garter and V. R.; and from these angels spring the spandrels which support the roof. In the centre of each side is a deeply recessed doorway, the spandrels of which are enriched with the Tudor rose, portcullis, &c., in quatre-foils. The other portion of each side is divided into arched compartments, within which are emblazoned the arms of England, Scotland, and Ireland, which are repeated in the windows flanking the east and west doorways. The southern door, being the entrance to the House, is more magnificently light than the others; the arch is deeply moulded, and enriched with roses and leaves in colours, and, immediately over the inner doorway, filled with superb gates, brass gilt, are the royal arms, of colossal proportions, in rich colours. The heraldic elaboration of the brass gates is indescribably beautiful; altogether, they are the finest specimen of working in metal executed for many years in this country. At each angle of the lobby floor, is a lofty brass standard for gas-lights, of admirable design. The flooring is of encaustic tiles of heraldic design, and in the centre is a large Tudor rose and star of brass, and Derbyshire marbles. The ceiling is divided into compartments by deeply ribbed and moulded beams, and pendants, richly carved and gilt; and the spaces between these beams are smaller squares, on which are painted and gilt roses, thistles, and shamrocks, with rich foliated ornaments of red and green; and in the centre of the whole is a large red and white rose, surmounted by a radiating nimbus, on a deep blue ground. The entire ceiling is peculiarly chaste and effective, and rich without garishness. The mottoes, "*Dieu et mon droit*," and "*Domine salvam fac Regiam*," are variously repeated throughout the noble apartment.

The principal entrance to

THE HOUSE

is by the brass gates. It is a right regal chamber, in proportion, arrangement, and decoration; ninety feet in length, forty-five in breadth, and of the same height. In plan the House is divided into three parts, the northern and southern being considerably smaller than the centre, or body, of the House, wherein are the

woolsack, clerks' tables, &c.; and on either side the seats for the peers, in rows. At the southern end is the royal throne; and at the northern the bar. On each side of the chamber are six large and lofty windows, to be filled with stained glass, representing the kings and queens of England. At each end are three archways, corresponding with the windows; on the surface of the wall within these arches frescoes will be painted; the arch over the throne being already filled by Mr. Dyce's fresco of "the Baptism of St. Ethelbert." The archways at the northern end are very deeply recessed, thus affording space for the strangers' gallery; below which is the reporters' gallery. Between the windows and arches are eighteen canopied niches, in which will be placed statues of the eighteen barons who wrested Magna Charta from King John. The demi-angels, pillars, pedestals, canopies, quatre-folls in the spandrels, &c., are all gilded, and the interiors of the niches are elegantly diapered. Around the House is a narrow gallery, with an elegant brass-gilt enclosure. Below the windows the walls are lined with oak panelling, elaborately wrought: its details include V. R., with an oak wreath and cord intertwining; ogee arches, crockets, and finials; portrait-busts of all the kings of England; "God save the Queen," in Tudor characters; and a pierced brattishing of trefolls, beautifully executed. The covered portion, immediately beneath the gallery, is richly emblazoned with the arms of the various Lord Chancellors of England.

The ceiling is flat, and is divided into eighteen large compartments by bold tie-beams, on each of which is sculptured, and twice repeated, "*Dieu et mon droit*;" and these beams being pierced aid the ventilation. The eighteen compartments are again divided by smaller beams into four, having in their centres lozenge-formed compartments. These sub-divisions are filled with devices and symbols, indicating the royal monogram, and the monograms of the Prince of Wales and Prince Albert; the cognizances of the white hart, the lion, the crown in a bush, the falcon, the dragon, and the greyhound, the lion passant of England, the lion rampant of Scotland, and the harp of Ireland, besides sceptres, crowns, scales of justice, mitres and crosiers, blunted swords of mercy, the Prince of Wales's plume, and floriated emblems too numerous for us to particularise; they are elaborately executed in colours and gilding; so minute in detail that an opera-glass is requisite to appreciate all their beauties.

The Bar is of oak, intricately carved, and crowned with bold figures of the lion and unicorn holding shields; and some of the panels have an elaborate treillage of vine, oak, rose, and thistle; and at the angles are badges of the royal houses of England.

The floor is carpeted with bright blue, spotted with roses of gold colour; the woolsack is crimson; and the clerks' table is of oak, exquisitely carved. Around the House are noble brass branches, with coronal tops, for gas-lights; and at each end of the peers' seats is a superb and lofty candelabrum, twelve and a half feet high, for wax-lights—a beautiful specimen of metal work.

(To be continued.)

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. V.

WOMAN'S A RIDDLE.

Don't you consider Fairleigh to be looking very thin and pale, Miss Saville?" inquired Coleman, when we joined the ladies after dinner, speaking with an air of such genuine solicitude, that any one not intimately acquainted with him would have imagined him in

earnest. Miss Saville, who was completely taken in, answered innocently,

"Indeed, I have thought Mr. Fairleigh much altered since I had the pleasure of meeting him before;" then, glancing at my face with a look of unfeigned interest, which sent the blood bounding rapidly through my veins, she continued:—"You have not been ill, I hope?" I was hastening to reply in the negative, and to enlighten her as to the real cause of my pale looks, when Coleman interrupted me by exclaiming—

"Ah! poor fellow, it is a melancholy affair. In those pale cheeks, that wasted, though still graceful form, and the weak, languid, and unhappy, but deeply interesting, *tout ensemble*, you perceive the sad results of—am I at liberty to mention it—of an unfortunate attachment."

"Upon my word, Freddy, you are too bad," exclaimed I, half angrily, though I could scarcely refrain from laughing, for the pathetic expression of his countenance was perfectly irresistible. "Miss Saville, I can assure you—let me beg of you to believe, that there is not a word of truth in what he has stated."

"Wait a moment, you're so dreadfully fast, my dear fellow! You won't allow a man time to finish what he is saying," remonstrated my tormentor, "attachment to his studies, I was going to add, only you interrupted me."

"I see I shall have to chastise you before you learn to behave yourself properly," replied I, shaking my fist at him playfully; "remember, you taught me how to use the gloves at Dr. Mildman's, and I have not quite forgotten the science even yet."

"Hit a man your own size, you great big monster you," rejoined Coleman, affecting extreme alarm; "Miss Saville, I look to you to protect me from his tyranny; ladies always take the part of the weak and oppressed."

"But they do not interfere to shield evil-doers from the punishment due to their misdemeanours," replied Miss Saville, archly.

"There now," grumbled Freddy, "that's always the way; every one turns against me; I'm a victim, though I have not formed an unfortunate attachment for—any thing or any body."

"I should like to see you thoroughly in love for once in your life, Freddy," said I; "it would be as good as a comedy."

"Thank ye," was the rejoinder, "you'd be a pleasant sort of fellow to make a confidant of, I dare say:—here's a man now, who calls himself one's friend, and thinks it would be 'as good as a comedy' to witness the display of our noblest affections, and would have all the tenderest emotions of our nature laid bare, for him to poke fun at—the barbarian!"

"I did not understand Mr. Fairleigh's remark to apply to *affaires du cœur* in general, but simply to the effects likely to be produced in your case, by such an attack," observed Miss Saville, with a quiet smile.

"A very proper distinction," returned I; "I see that I cannot do better than leave my defence in your hands."

"It is quite clear that you have both entered into a plot against me," rejoined Freddy; "well, never mind, *mea virtute me involvo*: I wrap myself in a proud consciousness of my own immeasurable superiority, and despise your attacks."

"I have read, that to begin by despising your enemy is one of the surest methods of losing the battle," replied Miss Saville.

"Oh! if you are going to quote history against me, I yield at once—there is nothing alarms me so much as the sight of a blue-socking," answered Freddy.

Miss Saville proceeded to defend herself with much vivacity against this charge, and they continued to converse in the same light strain for some time longer; Coleman, as usual, being exceedingly droll and amusing, and the young lady displaying a decided talent for delicate and playful *badinage*. In order to enter *con amore* into this style of conversation, we must either be

(¹) Continued from p. 148.

in the enjoyment of high health and spirits, when our light-heartedness finds a natural vent in gay railery and sparkling repartee, or we must be suffering sufficient positive unhappiness to make us feel that a strong effort is necessary to screen our sorrows from the careless gaze of those around us. Now, though Coleman had not been far wrong in describing me as "weak, languid, and unhappy," mine was not a positive, but a negative unhappiness, a gentle sadness, which was rather agreeable than otherwise, and towards which I was by no means disposed to use the slightest violence. I was in the mood to have shed tears with the lovesick Ophelia, or to moralize with the melancholy Jacques, but should have considered Mercutio a man of no feeling, and the clown a "very poor fool" indeed. In this frame of mind, the conversation appeared to me to have assumed such an essentially frivolous turn, that I soon ceased to take any share in it, and, turning over the leaves of a book of prints as an excuse for my silence, endeavoured to abstract my thoughts altogether from the scene around me, and employ them on some subject less dissonant to my present tone of feeling. As is usually the result in such cases, the attempt proved a dead failure, and I soon found myself speculating on the lightness and frivolity of women in general, and of Clara Saville in particular.

"How thoroughly absurd and misplaced," thought I, as her silvery laugh rang harshly on my distempered ear, "were all my conjectures that she was unhappy, and that, in the trustful and earnest expression of those deep blue eyes, I could read the evidence of a secret grief, and a tacit appeal for sympathy to those whom her instinct taught her were worthy of her trust and confidence! Ah! well, I was young and foolish then (it was not quite a year and a half ago), and imagination found an easy dupe in me; one learns to see things in their true light as one grows older, but it is sad how the doing so robs life of all its brightest illusions."

It did not occur to me at that moment, that there was a slight injustice in accusing Truth of petty larceny in regard to a *brilliant* illusion in the present instance, as the fact (if fact it were) of proving that Miss Saville was not unhappy, could scarcely be reckoned among that class of offences.

"Come, Freddy," exclaimed Mrs. Coleman, suddenly waking up to a sense of duty, out of a dangerous little nap in which she had been indulging, and which occasioned me great uneasiness, by reason of the opportunity it afforded her for the display of an alarming suicidal propensity which threatened to leave Mr. Coleman a disconsolate widower, and Freddy motherless.

As a warning to all somnolent old ladies, it may not be amiss to enter a little more fully into detail. The exhibition commenced by her seating herself bolt upright in her chair, with her eyes so very particularly open, that it seemed as if, in her case, Macbeth or some other wonder-worker had effectually "murdered sleep." By slow degrees, however, their lids began to close; she grew less and less "wide awake," and, ere long, was fast as a church; her next move was to nod complacently to the company in general, as if to demand their attention. She then oscillated gently to and fro for a few seconds to get up the steam, and concluded the performance by suddenly flinging her head back, with an insane jerk, over the rail of the chair, at the imminent risk of breaking her neck, uttering a loud snort of triumph as she did so.

Trusting the reader will pardon, and the humane society award me a medal for this long digression, I resume the thread of my narrative.

"Freddy, my dear, can't you sing that droll Italian song your cousin Lucy taught you? I'm sure poor Miss Saville must feel quite dull and melancholy."

"Would she did!" murmured I to myself.

"Who is to play it for me?" asked Coleman.

"Well, my love, I'll do my best," replied his mother;

"and, if I should make a few mistakes, it will only sound all the funnier, you know."

This being quite unanswerable, the piano was opened, and, after Mrs. Coleman's spectacles had been hunted for in all probable places, and discovered at last in the coal-scuttle, a phenomenon which that good lady accounted for on the score of "John's having hurried her so when he brought in tea;" and when, moreover, she had been with difficulty prevailed on to allow the music-book to remain the right way upwards, the song was commenced.

As Freddy had a good tenor voice, and sang the Italian buffa song with much humour, the performance proved highly successful, although Mrs. Coleman was as good as her word in introducing some original and decidedly "funny" chords into the accompaniment, which would have greatly discomposed the composer, if he had by any chance overheard them.

"I did not know that you were such an accomplished performer, Freddy," observed I; "you are quite an universal genius."

"Oh, the song was excellent!" said Miss Saville, "and Mr. Coleman sang it with so much spirit."

"Really," returned Freddy, with a low bow, "you do me proud, as brother Jonathan says; I am actually--that is, positively--"

"My dear Freddy," interrupted Mrs. Coleman, "I wish you would go and fetch Lucy's music; I'm sure Miss Saville can sing some of her songs; it's--let me see--yes, it's either down stairs in the study,--or in the boudoir,--or in the little room at the top of the house,--or, if it isn't, you had better ask Richards about it."

"Perhaps the shortest way will be to consult Richards at once," replied Coleman, as he turned to leave the room.

"I presume you prefer buffa songs to music of a more pathetic character!" inquired I, addressing Miss Saville.

"You judge from my having praised the one we have just heard, I suppose."

"Yes, and from the lively style of your conversation; I have been envying your high spirits all the evening."

"Indeed!" was the reply; "and why should you envy them?"

"Are they not an indication of happiness, and is not that an enviable possession?" returned I.

"Yes, indeed!" she replied, in a low voice, but with such passionate earnestness as quite to startle me. "Is laughing, then, such an infallible indication of happiness?" she continued.

"One usually supposes so," replied I.

To this she made no answer, unless a sigh can be called one, and, turning away, began looking over the pages of a music-book.

"Is there nothing you can recollect to sing, my dear?" asked Mrs. Coleman.

She paused for a moment as if in thought, ere she replied,

"There is an old air, which I think I could remember; but I do not know whether you will like it. The words," she added, glancing towards me, "refer to the subject on which we have just been speaking."

She then seated herself at the instrument, and after striking a few simple chords, sang, in a sweet, rich voice, the following stanzas:—

I.
Behold how brightly seeming
All nature shows!
In golden sun-light gleaming,
Blushes the rose.
How very happy things must be
That are so bright and fair to see!
Ah, no! in that sweet flower,
A worm there lies;
And lo! within the hour,
It fades—it dies.

II.

Behold, young beauty's glances
 Around she flings;
 While as she lightly dances,
 Her soft laugh rings:
 How very happy they must be,
 Who are as young and gay as she!
 'Tis not when smiles are brightest,
 So old tales say,
 The bosom's lord sits lightest—
 Ah! well-a-day!

III.

Towards the greenwood's cover
 The maiden steals,
 And, as she meets her lover,
 Her blush reveals
 How very happy all must be
 Who love with trustful constancy.
 By cruel fortune parted,
 She learns too late,
 How some die broken-hearted—
 Ah! hapless fate!

The air to which these words were set was a simple plaintive old melody, well suited to their expression, and Miss Saville sang with much taste and feeling. When she reached the last four lines of the second verse, her eyes met mine for an instant, with a sad reproachful glance, as if upbraiding me for having misunderstood her, and there was a touching sweetness in her voice, as she almost whispered the refrain, "Ah! well a day!" which seemed to breathe the very soul of melancholy.

"Strange, incomprehensible girl!" thought I, as I gazed with a feeling of interest I could not restrain, upon her beautiful features, which were now marked by an expression of the most touching sadness, "who could believe that she was the same person who, but five minutes since, seemed possessed by the spirit of frolic and merriment, and appeared to have eyes and ears for nothing beyond the jokes and drolleries of Freddy Coleman?"

"That's a very pretty song, my dear," said Mrs. Coleman; "and I'm very much obliged to you for singing it, only it has made me cry so, it has given me quite a cold in my head, I declare," and, suiting the action to the word, the tender-hearted old lady began to wipe her eyes, and execute sundry other manœuvres incidental to the malady she had named. At this moment Freddy returned, laden with music-books. Miss Saville immediately fixed upon a lively duet which would suit their voices, and song followed song, till Mrs. Coleman, waking suddenly in a fright, after a tremendous attempt to break her neck, which was very near proving successful, found out that it was past eleven o'clock, and consequently bed-time.

It can scarcely be doubted, that my thoughts, as I fell asleep, (for, unromantic as it may appear, truth compels me to state, that I never slept better in my life,) turned upon my unexpected meeting with Clara Saville. The year and a half which had elapsed since the night of the ball had altered her from a beautiful girl into a lovely woman. Without in the slightest degree diminishing its grace and elegance, the outline of her figure had become more rounded, while her features had acquired a depth of expression which was not before observable, and which was the only thing wanting to render them (I had almost said) perfect. In her manner there was also a great alteration; the quiet reserve she had maintained when in the presence of Mr. Vernon, and the calm frankness displayed during our accidental meeting in Barstone Park, had alike given way to a strange excitability, which at times showed itself in the bursts of wild gaiety which had annoyed my fastidious sensitiveness in the earlier part of the evening, at others in the deep impassioned feeling she threw into her singing, though I observed that it was only in such songs as partook of a melancholy and even despairing character that she did so. The result of my meditations was, that the young lady was an interesting enigma, and that

I could not employ the next two or three days to better advantage than in "doing a little bit of *Oedipus*," as Coleman would have termed it, or, in plain English, "finding her out;"—and hereabouts I fell asleep.

RAMBLES IN BELGIUM.

No. VIII.—ANTWERP.

THE road from Malines to Antwerp is flat and dull enough, and has few features of interest. The old châteaux, with their odd-looking turrets, and the straight formal rows of poplars, are occasionally passed; the fields always presenting an abundant population most industriously employed. The nearer Antwerp is approached, the land becomes somewhat uneven, and the majestic tower of the cathedral soars over every thing near and around. The steeple is very lofty, and can be seen for a considerable distance. Flax is cultivated to a great extent; and wheat grows most luxuriantly,—some ears that I had given me were plump and of the finest quality. The women in the fields sag away, regardless of the sun, and seem much more inured to their work than the men. It does not need any guide or *valet de place* to inform a traveller to Antwerp that it is a fortified city. Entering by the Porte de Bergerhout, the drawbridges, *fossés*, mounds, etc., are passed in succession, and seem to spread their ramifications in all directions. It is soon evident what a stronghold the place must be. The streets are very narrow and gloomy, and in some parts have a most sombre look.

The Place Vert is in the heart of the city, and, being full of trees, and containing several cafés and hotels, affords a great relief to the eye that has seen so little cheerfulness in the neighbouring streets.

Near the Place de Mer is the house, and garden, formerly the abode of the great genius of Antwerp, Rubens, who gave his most superb picture, "The Descent from the Cross," to the company of the Arquebusers, for this dwelling place.

The Place de Mer is a very grand street, and compensates for the smallness, narrowness, and gloom, of some of the smaller ones. There are several very handsome houses in it; one has the royal arms over it, and is used by the present King of the Belgians when he visits the city. The quays are of great extent, and are matchless. Very near one of them, which is the place of embarkation from the steam-boats, there has been recently erected a statue of Rubens, of large proportions. I cannot say it gave me so pleasing an idea of the artist as the portrait painted by himself, so well known, and so often copied and engraved. Antwerp was the scene of a high festival on the day of the inauguration of this monument to the memory of one whom Antwerp may be justly proud to call her own.

There is no city in the world, Venice alone excepted, which attained to so great a prosperity as this. In commercial greatness, it was without a rival. All nations held a mart within its walls. Like Venice, alas! the days of its splendour and glory are past. Merchants were its princes, and their habitations were its palaces. Like Venice, too, it was the home and haunt of men who have left an undying reputation; men, too, who excelled in the same art: Rubens, Vandyke, Quentin Matsys, Teniers;—all of whom contributed in themselves to form a school, and who have here left behind them testimonials of their departed worth. The cathedral, which is dedicated to "Our Lady," is very beautiful and very large. It is of Gothic architecture, and has suffered considerably by the devastations of time. The stone-work has been frequently under repair, and, whilst I was in the town, scaffolding was being erected for a similar purpose.

The general aspect of the interior is very striking, very imposing,—the painted windows, the massy columns, the sculptured tombs—all unite in producing a solemn and devotional feeling, as one traverses the aisles. The pulpit is, as usual, one of those specimens of carving by Verbruggen, which are so prevalent in this country, and of which, from their constant recurrence, I began to feel weary: this one is full of quaint emblems and odd devices. There are several monuments in marble that deserve a longer inspection than one feels disposed to give them when it is known that a great work of art is so near. This picture, known all over Europe, is hid from the world without by two wings, which are painted on both within and without, and refer to the name of Christopher. One represents St. Christopher bearing the Infant Christ. The other is designed to be another saint, who seems waiting to receive his comrade: at least, such was the impression I received of the intended effect. On another side the Virgin is receiving the Salutation of Mary and Elizabeth, and upon another the priest Simon is holding Christ. But, admirably as these are designed, they are forgotten and lost sight of when the volets are drawn aside and the wondrous picture of pictures is displayed. Before that, all things surrounding are as though they were not. The excessive holiness, so to speak, of this composition—the masterly grouping of the actors in the mournful ceremony, are such as no pen can describe. The principal figure is faultless; the bend of the body in its descent, the placid calm expression, and the corpse-like flesh, are beyond all praise, and far above all criticism. The whiteness of the sheet is most inimitable, and contrasts wonderfully with the deadness of the flesh. I never saw any pictorial representation so suggestive of divinity. It is impossible to stand before it, and remain unmoved.

An old lady, evidently English, was quite overcome with her emotions, and remained gazing, after I left it to see his other productions, none of which were so impressionable as this.

The Elevation of the Cross, the Assumption of the Virgin, and the Resurrection, are all paintings of the highest merit. I was pleased to hear the lower class of people and shopkeepers express their reverence for the works of their own Rubens, and yet, how strange is it, and seemingly inconsistent, that these same individuals, whose appreciation and homage is so true and so genuine, not only tolerate, but approve of, images of the Virgin and Infant Saviour,—which are placed against the walls of many of the corners of the streets, and are tawdry, tasteless, wretched productions: at night they are illuminated by tallow candles and bits of tapers, which serve to show off and enhance their native ugliness. This custom prevails in most of the towns in Flanders, and occurs oftentimes by the wayside. If they require such stimulants to prayer and a remembrance of duty, how much better is the simple cross! what volumes of real religion are contained in a cross, so emblematic, and common to all Christian people! The church of St. Andrew has a noble pulpit, the story being the departure of St. Andrew to follow our blessed Lord. Some of the smaller objects are exquisitely delicate, and are finished as minutely as the most elaborate lace-work. There is a monument to the memory of Mary Queen of Scots, erected by her maids of honour. The inscription shows their zeal, if not their discretion: "Perfidia senat: et heret: post 19 captivit. annos relig: ergo caput obtruncata."

In the church of St. Paul are some works of Vandyke, and two of Teniers. At the entrance is a barbarous conception of Calvary. Anything more revolting or coarse it is impossible to imagine. It distances in its disgusting details the daubs and dolls before spoken of, and can serve no other purpose than to shock and offend.

There is no religion in such things; their tendency must be adverse to anything like real devotional hum-

bleness of mind and heart, or the prayerful lifting up of the inner man. The church of St. Jacques is ornamented by an altar-piece of Rubens. It is a Holy Family, and embodies portraits of himself, his two wives, father, grandfather, and child. The tomb of the illustrious painter is here. It had gone to decay, and suffered severely; but was restored by a canon of the cathedral in 1775. A slab of white marble, on which is an inscription to record the genius and reputation of the artist, covers the illustrious remains.

The church of the Augustines contains an altar-piece that is of the finest quality of art. In it, Rubens again went far before my previously high-wrought expectations. The subject—the Marriage of St. Catharine, has but small field for the imagination to work upon; yet, on this canvas, all is excellent. The heads of some saints are perfect, and the colouring of the men's dresses as rich as it is possible to conceive. I was so tired, whilst in this city, with repeated visitations to enjoy the beauties of Rubens, that I should entail something of my weariness upon the reader, were I to detail the half only of the contents of the Museum. In one of the rooms is preserved a memento of Rubens,—the chair on which he sat as president of the academy. The inhabitants place a great value on this relic.

The celebrated painting of the Crucifixion of Christ:—On either side are the two thieves; the expression on the faces of every person introduced is wonderful; the longer I gazed on the marvellous scene, the more I was astonished with the completeness and beauty of the whole. Every face is a picture in itself. It is, indeed, a magic power, which can create such a vivid composition as this. Rubens has done wisely;—in Antwerp he has left his choicest memorials. Antwerp is his shrine. The Adoration of the Magi is another large picture, with a great many figures in it, and is in his finest style of colouring.

To enumerate the others would really be to write a catalogue; they will not be overlooked when once the gallery is entered. I was disappointed with the Hotel de Ville; there is nothing remarkable in it,—in every way it is inferior to the magnificent edifices I have described as adorning Louvain, Brussels, and other towns. It is situated in an old square, and is surrounded by some veritable remains of the Spanish sway in Flanders; one house, in particular, was pointed out for my observation, as having been the residence of Charles the Fifth, on his occasional visits to this city. There is an immense pile of building, called the Hanseatic House, which serves as a depot for merchandize.

The Exchange was erected during the latter part of the fourteenth century: there are truncated pillars or columns, somewhat resembling those at Liege, in the court; and the entire character of the edifice resembles the old Venetian. It is said that Sir Thomas Gresham, when on a journey in this place, was so delighted with this bourse, that he took it as a model for the old Royal Exchange in England.

On quitting the gallery of paintings at the Museum, I made an appointment to accompany a gentleman over the Citadel, the works of which have been renovated since the memorable siege of 1832, under the General Chassé. There are some evidences remaining of the terrific bombardment which shattered several buildings into dust. The outer fortifications appear to be renewed in all their pristine strength.

The time of my departure from Flanders being at hand, I had occasion to pay a visit to the Dominions, whose great incivility, and unnecessary and most unmeaning procrastinating habits, I can and must speak of. On the night I quitted Antwerp, and took my berth on board the steamer, I produced my luggage for their inspection. Whilst the process, sufficiently tiresome and annoying in itself, was going on—of emptying on the floor all one's linen and travelling equipments, my great coat was seized and thrown across a bar of iron in the room. Presently a fellow-voyager smelt fire, and

exclaimed loudly to that effect; little notice was taken of this, but the smell becoming too powerful for the olfactory organs of the officials, a search through the apartment was instituted, and my hapless garment proved the cause. It had been cast on an iron which had some connexion with the stove, and the latter having been overheated, a large hole had been burnt in my coat. For this damage I could obtain no other recompense than a variety of shrugs and exclamations, and, as the steamer, being governed by the tide, could not wait for any man, I was obliged to put up with it. The commonest attention would have prevented it. I was sorry when the last glimpse of Antwerp faded slowly from my sight, as I stood on deck. Belgium, with many faults, is, after all, a pleasant land to sojourn in. Provisions, and living of all kinds, are cheap and easily accessible. The people, generally speaking, are civil, courteous, and obliging. The climate is pleasant, and the aspect of the country, though flat, is not destitute of interest.

To live in it for ever and ever, is what I cannot think any Englishman would voluntarily choose to do. Much is there in its old cities to charm the antiquarian and the lover of history and old associations; but there is nothing, at least that I saw, to compensate for the sweet comforts of an English home; nothing to supply the place of the parks and groves, and, above all, the lanes and trim neatness of rural England.

AN ACCOUNT OF THE LIFE AND WRITINGS OF MADAME GUIZOT.¹

FROM 1795, to the end of the last century, if liberty was not complete and secure, still there was liberty; and spectators were able to participate in the movement of public affairs, otherwise than by pity or detestation. Every one could form and advance an opinion, apply himself to some cause, be concerned in a plan: in short, pursue an honorable course with some prospect of success. The revolution had encroached so much upon civil liberty, that it reacted against the revolution itself; there was a struggle, a struggle perhaps unforeseen but not hopeless. For the first time Mademoiselle de Meulan took an interest in political events; she ardently wished success to those who fought against the revolution, for it had been oppressive, and her sympathy naturally turned to the side of the opposition. What she hated in the revolution was its violence; what she admired in some of its adversaries, was independence in misfortune. At the same time, she was endeavouring to enlarge her mind by new studies. Her taste drew her towards moral theories, and metaphysical inquiries. She began some books, and tried to initiate herself into the theories of the philosophy of the 18th century; she did not finish them. Her mind was so free, so spontaneous, so active in itself, that it could not yield without reluctance to the subjugation, which an examination of the ideas of others imposes; it preferred directly attacking realities, than searching without an interpreter the mysterious meaning of the enigmas with which our reason is surrounded.

The best and most serious books were to her but subjects for meditation, either to make the ideas she met with her own by a deeper research, or to arrive by her own single strength at ideas, which she held not in common with any one. Thus, she studied more than she read, and gave herself the habit of writing a great deal, but only in order to regulate her thoughts, or give account of her meditations. What is written, in fact, fixes and elucidates all, and makes us, in some way, be present at the display of our own mind.

It was at this time, that two friends of her father's, Monsieur Suard, and Monsieur Devaines, suggested to

Mademoiselle de Meulan, that she might take advantage of her talents, not only to extend the circle of her activity, but also to lighten the burden which weighed upon her family. Thus what had been her solace in retirement, became her resource in misfortune; and from this time, labour, either from necessity or choice, became the constant occupation of her life. Her first novel, *Les Contradictions*, which displays keen wit, and a great facility of style, appeared in 1800, and obtained such success, as made her name known to the world, and excited a great interest in her situation. Society was beginning to amend; it eagerly encouraged a young person, whose misfortunes had been their own, and who opposed her talents to her destiny.

La Chapelle d'Ayton was published soon after, and modestly presented as a translation from the English; it is not even an imitation, the general idea is all that Mademoiselle de Meulan had borrowed. Most of the events, the unfolding of the characters, the form of the recital, in short, the sentiments and the expressions, are her own. Few novels are more engaging, though it contains neither exaggerated sentiments, nor unnatural scenes; it is, however, a narrative which pierces the heart, and carries our compassion even to pain. The source of its interest is derived from one of those cruel mistakes, which have given so many affecting works to our stage, and of which the tragedy of *Tancrède* is perhaps the finest and the most pathetic example.

In *La Chapelle d'Ayton*, the sensibility of the author is entirely displayed, and even with that excess which belongs only to youth,—to that age, when the emotions, whatever they may be, go not beyond their strength; when imagination softens their bitterness, and often even lends them an inexpressible charm: at a later period, they are too painful. Madame Guizot, I have no doubt, would not have had the courage to compose *La Chapelle d'Ayton*, and to combine so much innocence and misfortune, when she wrote: "The effect of the works of art ought to be such, that no idea of reality adheres to it; for as soon as that enters it, the effect becomes distressing, and even sometimes insupportable: therefore, I cannot bear, at the theatre, or in novels, or poems, under the names of Tancrède, or Zara, or Othello, or of Delphine, the sight of those great afflictions of the mind, or severe dispensations of fortune. In point of happiness and grief, my life has been so full, so alive to them, that I cannot touch upon one of those depths without a trembling hand. The reality reveals itself to me, through all the coverings with which art can envelope it; my imagination, once disturbed, reaches it in one bound. It is but a short time since the music in *L'Agnese* produced the same effect on me as I usually experienced from the works of art. I could not bear the *finale* of *Romeo and Juliet*; that of *L'Agnese* alone, made me weep without rending my heart." (1821.)

Whatever may be the affecting interest which pervades *La Chapelle d'Ayton*, it is remarkable, that the work offers but few traces of that indulgence for passion, that sentimental theory, which sacrifices judgment to feeling, and flatters the bewitching fantasies of an exalted imagination, at the expense of conscience and of truth. Few novels are more free from what can be called romantic morality. I insist upon this observation, because it is characteristic.

At the time Mademoiselle de Meulan wrote, there was a happy singularity in preserving oneself from the opinions which prevailed in literature, and in society, with regard to duty and affection. It was the time when sympathy explained every thing, when devotedness excused every thing; when the heart knew no rule but affection, no virtue but fidelity. Mademoiselle de Meulan was far from having reflected on all things, with such serious impartiality as she has since done; she did not then know, as she did at a later period, that there is something higher than sensibility itself, which consecrates by regulating it. But, in default of principles, her native good sense taught her, that what weakens the

(1) Continued from page 156.

character, what wastes time, and blunts the feelings, could not be the real vocation of human nature; and that every thing, even the ability to love, has been bestowed upon us for a higher end than our gratification.

In 1801, Monsieur Suard established a newspaper, under the name of *Le Publiciste*. A moderate independence, the love of order without oppression, and of truth without boldness; in fact, the philosophy of the eighteenth century, enlightened and intimidated by the revolution, formed the spirit of this publication. It agreed, although imperfectly, with the opinions of Mademoiselle de Meulan, and she did not scruple to take a share in its compilation. She wrote innumerable articles upon literature, society, and the stage; the merit and success of which decisively established her rank amongst the first writers of the age. The composition of newspapers is a work, which, though sometimes amusing, is necessarily hurried, and is one which both stimulates and wears the mind. Nothing less than varied powers, such as those of Mademoiselle de Meulan, would have sufficed for such an undertaking. Notwithstanding the constant demand upon them, she was never at a loss, and knew, in a species of work in which it is very difficult not to fall sooner or later into routine and profession, how to pursue and even to increase that sprightly originality, which distinguished and marked her articles, even better than the first letter of her name Pauline. The remembrance of them is not effaced amongst the persons of that time; expected with anxiety, read with eagerness, they often formed the whole topic of conversation in society, which at that time took up those little things with more interest than it would be reasonable to do at present.

This was a time of re-action. After violent commotions, society sought only for repose; every opinion which could have contributed to disturb it, became suspected; every thing that seemed to lead to, or to evince the return of order, was received with favour. Thus, those peaceful occupations, those harmless pleasures, which appear to some minds the whole of civilization; the enjoyment of society, literature, arts, &c. were taken up again, as benefits long forgotten, as proofs and securities of public tranquillity. At the same time, all consideration was withdrawn from the things most important to the community; the great subjects of politics and philosophy gained scarcely any attention: people were unwilling to consider them, lest they might bring every thing into question. It has been said, that the true wisdom of society was not to meddle with its concerns; and France only desired two things, to be governed, and to be left in peace. This weak disposition made the fortune of despotism; but, for a lesson to human nature, France, abdicating without finding rest, learned by experience, that there is no compensation for the sacrifice of liberty.

Mademoiselle de Meulan did not at that time give a reason for this general disposition, which drove all minds under the yoke. She, herself, partook of it to a certain degree, from the recollections of indignation and grief, which the ill time of the revolution had impressed upon her. She was, however, far from calling in slavery as an expiation for anarchy; and struggled undesignedly, and from the sole effort of her own independence of mind, against that timidity of troubled reason, which tends to bring back in books and manners, as well as in the laws and institutions, that puerile frivolity, the companion and the instrument of superficial literature and servile politics. She accordingly aroused herself to what was still called philosophy, but did not adopt all its principles; she soon combatted them on matters of morals, those to which she had devoted most attention; for, from that time, all her compositions prove a visible desire to bring every thing back to a moral point of view. Even literary criticism was to her but an opportunity of studying human nature, and she drew up her judgments upon literary productions in the form of essays, which

were designed either to portray, or to elucidate them. This method had at that time the great merit of novelty.

In the general zeal for returning to good principles, literature had not been forgotten, and nothing was more spoken of than the necessity of following the great models in every thing, a sort of criticism which consists in drawing up in books the rule for books, and in giving to art for a model, the examples which it has itself produced. Women are not easily satisfied with this criticism of rhetoricians; we hear them almost always judge of the compositions of art by the reality, or after their own mind, which is also reality. It is perhaps because they are less learned, that they become more true. When they apply themselves seriously to literature, and have received the advantage of strength of mind, the ardour of talent, if they keep their natural manner of judging, they can carry into criticism a genuine superiority, and give to their literary views something of the interest and value which is attached to original works.

This is what may be remarked in the greater number of articles by Mademoiselle de Meulan. The value of them is often independent of the work which suggested them: even when they cannot be connected with the general ideas of human nature, they at least join in portraying the manners and the age. A choice of these articles would form an agreeable collection, and some of them might serve for a history of society in France after the revolution.

The reputation of Mademoiselle de Meulan made her daily more sought after by the world. She appeared in it as much as her labours would permit; it amused her mind; she excelled in conversation and enjoyed it, as affording opportunities for observation, and exercising the mind by compelling it to reflect quickly, and disclose itself clearly. She felt, nevertheless, that much was still wanting to the happiness of her life. She had no one to sympathize with her. Ever independent and natural, she felt the consciousness of a power superior to all that she did, and life appeared inadequate to it. Her influence around her was effectual and salutary: the affairs of the family were managed by her care, and made easy by her labour. In 1803 she married her sister to Monsieur Dillon, and gave up, on that occasion, her own share of an inheritance that belonged equally to both. Persuaded that she would always live a single life, sure of the resources of her own talents, and looking forward to the future with a confidence that never forsook her, those acts, which are generally called sacrifices, were to her so easy that it had been almost an injustice to praise her for them. Devotedness was, with her, the very consequence of her independence; it formed a part of her existence; she almost thought she had a mission to regulate every thing, to improve every thing around her, and to consider herself as nothing; for nothing common would have satisfied her. It was fit that she should do much for the happiness of others, as they could do so little for hers! She felt that it was placed beyond the common lot, and that it did not depend on any one about her, or even on herself, to give it to her. She regretted this happiness that she was born to feel, but she no longer expected it.

She was mistaken: it was not an ever solitary and hard lot that awaited her; by a rare dispensation in this life, it was happiness of such a kind as was suited to her nature. She was about to fill the situation for which she was formed, and was one of the very few whom life has not deceived. In the month of March, 1807, she was in much affliction; her sister had just lost her husband, the family affairs were in great disorder, her mind was harassed with a thousand painful cares, and her impaired health obliged her to give up her literary labours. While in this distressing situation she was surprised by receiving a letter without any signature, and in an unknown hand. The writer did not wish to give his name, but said he had heard of her illness, and begged to be allowed to supply the articles she had been engaged to write for *Le Publiciste*, as long as she felt

herself unequal to the task. She at first refused, though both affected and surprised at the proposal: it was renewed with more earnestness, when, charmed with the tone of candour and simplicity in which the offer was made, she accepted it, and was supplied from time to time, by a secret conveyance, with such articles as she had no reason to regret publishing in place of her own. In the mean time the mystery continued; in vain, assisted by Monsieur Suard, did she endeavour to penetrate it. At length she addressed her wary correspondent, conjuring him to give his name, and refusing on any other terms to continue under such an obligation. He at length yielded, announced his name, and it was thus she became acquainted with Monsieur Guizot. He was at this time a young man, and had been about two years in Paris, where he lived buried in study, and preparing to make a name for himself some day in the literary world. He had heard Mademoiselle de Meulan spoken of by chance at Monsieur Suard's, and feeling the deepest interest in her situation, he contrived the plan above mentioned to assist her, which was at once an impulse of generosity and a whim of fancy; but one, however, to decide her future life.

From the time they became acquainted, they were not long before they had formed a sincere and intimate friendship, which at first consisted more of confidence than sympathy. They differed in many matters, and their opinions were far from being similar; the one being, as we have seen, attached to those of the last century, without entirely adopting them, and preserving the restless curiosity of a mind that wished to seek the truth elsewhere. The other contained within him the germ of all the ideas which have since been developed, and which are those of the present age; but absolute as inexperience, visionary as imagination, the tenets which he professed with enthusiasm at twenty, could not at first sight captivate a clear-sighted, particular mind, like that of Mademoiselle de Meulan. For a long time Monsieur Guizot knew only how to please, without persuading her; for a long time she loved without understanding him; yet she carried into this affection an admirable simplicity and devotedness, and guarded herself from imagining that this sentiment should ever become the charm and the happiness of her whole life. Labours in common, mutual services, endless conversations in which these two minds learned to understand each other, and to modify themselves by the impression, appeared for a long time to be the only affinity which ever would unite them. A day, however, was to come, when a complete sympathy would result from a long and mutual friendship, and from that day their common fate is to be fixed. The day at length came, when, ceasing to misunderstand the affection which united them, they gave it its true name. Their marriage took place on the ninth of April, 1812.

There is a kind of happiness of which one knows not how to write: expressions fail: it proclaims itself not. I find in a letter of Madame Guizot's (dated 1821), these words: "I am happy, the happiest creature upon earth." She said the truth; at least she felt it, and happiness can only be measured by feeling; it exists only in the impression which it produces; all its reality is in the heart. A situation at once happy and animated was what Madame Guizot had always wanted; had she been compelled to choose, I think she would have preferred activity to happiness; her sense, and that energy which nature had implanted in her, made activity a law to her; nevertheless, none felt more keenly or more deeply the real joys of life. "My resolution is taken," she somewhere says, "as soon as a barrier is raised between me and happiness; I now know very well, and will never more forget, that one can live without happiness; only when it is there I can ill brook any thing that disturbs it. You know, for I have told you so a hundred times, that it enfeebles me, or rather it is so suitable to my nature, I was so made for feeling it, that I give myself up to it with all my weakness." Such citations attest

better than I can do, that deep and overwhelming sensibility which was united in Madame Guizot to the austerity of her judgment. They also explain what influence the unmixed happiness of the last fifteen years of her life must have had upon her.

It is seldom that women are active without being excited, and strength of mind is with them scarcely ever free from rigidity. Truth, and truth alone, suffices, I believe at least, for the judgment of men; it can so completely seize upon it as to be no longer distinguishable, without borrowing some other power, some other charm than its own. It is not so with women; truth must take a form which will touch them, which will reach their understanding through their heart, borrow a voice which is dear to them, or present itself beneath a name they love. With whatever spring, with whatever energy the mind of Madame Guizot was endowed, I doubt that, had she lived solitary, it would ever have reached the height that it attained; there would have been always a sort of disturbance in her nature as there was in her lot, and some inequality between her reason and her opinions. The firm and calm judgment of her husband furnished her with the support she required, and brought harmony into her mind, by the united influence of happiness and truth. She had never any other master than him, and no example has better proved that a woman is never by herself all that she can be; it is necessary to her perfection that she should be loved, and that she should be happy.

(To be continued.)

THE GLASS MANUFACTURE.¹

SAND is not used at all in some of the richest and finest glass, such as that required for telescopes, the composition of which, according to Faraday, should be nitrate of lead, silicate of lead, and boracic acid, in the proportion of one hundred and fifty-four parts of the first, twenty-four of the second, and forty-two of the last. The reader may perhaps exclaim, "What is the use of telling me that? I am none the wiser for listening to terms which I do not understand: pray what is nitrate and silicate of lead?" Fearing that some readers, and these not the least intelligent, may really feel thus, we must pause a moment to explain these terms, and so make our path clear as we advance. Nitrate of lead is simply lead united to nitric acid,² or, as it was formerly termed, spirit of nitre, a substance abounding in nature, but procurable by heating nitre and sulphuric acid³ together. Thus nitrate of lead is this metal brought into a peculiar union with an acid substance. The other element of telescopic glass is silicate of lead, which arises from the union of oxide of lead with a most singular acid termed silicic. From this it will be seen that lead, nitre, and a peculiar flinty substance, enter into the composition of the glass recommended by Faraday. The remaining element is the boracic acid, formed from borax, (an element discovered by Sir Humphry Davy,) and oxygen. If the non-chemical reader is not wearied by this detail, which perhaps it is but insulting him to suspect, he must be struck by the vast circle of knowledge brought to bear on the manufacture of a piece of fine flint glass. The attempt to explain the three substances composing Faraday's glass, has necessitated the mention of six other bodies, to understand the nature of which would require an acquaintance with more than twenty different elements, and a familiarity with numerous processes of the most delicate nature.

All have probably noticed the weight of vessels formed from flint glass; and this will not appear sin-

(1) Continued from page 150.

(2) When this is weakened by water the mixture is called *Aqua-fortis*.

(3) This weakened with water is called oil of vitriol.

gular when we remember how largely lead enters into its composition. Various other effects follow the use of this metal, one being the superior density of the glass, in consequence of which it refracts the rays of light with great power, and this quality is clearly of the highest value for all glass used in telescopes. The lead also acts as a flux, and thus aids in fusing the various materials, while it imparts transparency and richness to the product. Care must, however, be taken not to use an excess of the litharge (oxide of lead) or the glass will be too soft for many purposes. These various substances, being mixed in the proportion desired, are put in the crucibles, and as the melting proceeds fresh ingredients are added, until the melted matter fills the crucibles. An intense and long-continued heat is required in the glass furnaces on two accounts; in the first place nothing short of such heat will bring into perfect fusion all the substances used; and it is also necessary for the expulsion of many impurities, the presence of which would inevitably spoil the glass. For in the alkaline matter employed are certain salts which will not unite with the silicious matter, but rising to the top of the crucible, form there a whitish froth over the liquid mass. Sometimes a little carbonaceous matter is found in the melted fluid, and this is destroyed by a due admixture of nitre with the other ingredients. Certain foreign substances will often become mingled with the sand, causing a discoloration of the glass, which must wholly destroy its value if not neutralized. This is effected by throwing in a small quantity of a dark powder, called the black oxide of manganese, which is in fact a metal combined with oxygen. The manganese may therefore be called a glass purifier, and was once termed "glass soap" from its cleansing qualities. But this soap will itself tarnish the glass unless care be taken not to introduce too much into the crucible, otherwise the whole mass will assume a purplish or even black hue. When the former of these results happens, that is when the purple tinge is produced, the evil is remedied in a singular and most simple manner. No elaborate processes are called in to neutralize the stain, a piece of wood dipped into the boiling glass restores it to the transparency required. How is this effect produced? The purple discoloration is caused by the manganese absorbing much oxygen, for which this metal has so strong an affinity that it is never found without it. The object of the workman is to remove this oxygen from the manganese, when the colour will instantly disappear. Now carbon or charcoal has a strong attraction for oxygen, and when the wood is thrust into the heated glass it becomes carbonized (made into charcoal), upon which the oxygen departs from the manganese to the wood, and is in this manner drawn away from the contents of the crucible.

Thus, by a knowledge of natural affinities, means are suggested which accomplish the purification of the glass with the utmost ease and certainty. It is this wide acquaintance with nature which enables the modern natural philosopher to advance with such speed along the path of physical discovery; for, without this comprehensive knowledge, the most important operations and experiments would be brought to a close every day. Thus, suppose our glass manufacturers were ignorant of the affinities between manganese and carbon, whole tons of glass would frequently be spoiled, and instead of the transparent vessels now in use, we should be compelled to drink from stained and impure glasses. Such results would lead to the abandonment of manganese as a purifier, and thus one means of controlling the action of his crucibles would be removed from the manufacturer. But all is made easy by knowing the nature of the two substances, manganese and carbon; though the majority, whose pleasures are increased by the abundance of pure and cheap glass, may never think much of the nice adaptations necessary to the creation of such enjoyments.

When all the impurities have been expelled, and

the melted glass brought to the required condition, it is allowed to cool until the whole acquires the consistency of paste, in which state it will bear the requisite handling without cracking or losing the shape impressed. The furnace is not, however, allowed to cool until the contents of the crucible have become transparent, which generally happens in about two days and nights from the commencement of the process. In this short period the sandy and alkaline substances have been so transformed in their natures, as to exhibit the appearance of a pearly paste, which may be blown, drawn into every variety of shape, pulled out into wire, or formed into elegant vases. Thus the sand, which was last year washed by the waves of each returning tide, is now wrought into graceful forms and beautiful designs, on which the cultivated taste may speculate with delight. To rule the waters with power and skill, to read the past histories of the starry host, and to see with clear vision the wonderful workings of Divine laws in the far extended universe, are great advantages. But the facility with which grains of sand and the ashes of vegetables are moulded into servants for human benefit, is not the least amongst the prized endowments of our race, and such a reflection is naturally suggested by the creation of yon sparkling vase from a heap of dust.

2. *Plate glass.*—The production of this costly material demands and receives the highest care, both in the selection of the materials from which it is formed, and in the careful fusion of the mass, and rolling of the bright plates. To make 1,200 lbs. of plate glass, 1,700 lbs. of five different substances must be mixed in the following proportions:—

Dried Lynn sand	720 lbs.
Fine soda	450 "
Slaked quicklime	80 "
Nitre	25 "
Old plate glass broken up	425 "

1,700 lbs.

The reader will perceive that exactly one fourth of the whole material employed is old glass, without which the crucible will not yield the quality required. Soda is also preferred to pearlash, as the fusion is thereby promoted. When all these materials are reduced to a liquid mass, the whole is ladled from the crucible into a vessel called a *curette*, from which, after some further heating, it is poured on the surface of a long table, and spread by a roller. This spreading of the plate is an extremely beautiful sight, for as the rollers press and smooth the transparent and gelatine-like glass, we see the most vivid colours wave to and fro along the polished plate, as if some distant Aurora were being reflected in a mirror. As soon as each plate sets in its mould, it is passed into an annealing oven, in which all the plates remain for about fourteen days, being allowed to cool but very slowly. This annealing process is necessary for all glass, which would otherwise possess such brittleness that the gentlest variations in temperature would cause the largest pieces to fly into fragments. Suppose a piece of plate glass, which had not undergone this operation, fixed in a window on some warm day; the first change in the thermometer would most probably cause its destruction, and, whilst gazing at surrounding objects through the crystalline substance, we should be startled by hearing the whole plate crack and shiver into a hundred pieces. This result is prevented by stopping the rapid cooling of the glass, which, being placed in an oven, and passed through successively diminishing degrees of heat, is prepared to resist the usual changes of the atmosphere. To what the brittleness of unannealed glass must be ascribed is a disputed point, but it is generally referred to some peculiar arrangement of the atoms, which the prolonged and gradually diminishing heat of the annealing oven alters. Thus after all the manufacturer's labour and skill have been employed, he is compelled to acknow-

ledge that the usefulness of his glass depends upon some invisible and mysterious changes which, though his arts can produce them, his understanding is unable to comprehend. But the large plates of glass are by no means fitted for use when withdrawn from the annealing oven; three processes are yet necessary before they reflect the clear image from the silvered mirrors, or adorn the windows of our mansions. They are first cut by the diamond to the shapes required, an operation requiring no description here. The plates are now ground, to remove the roughness found on the surfaces. This work requires great care, it being necessary to plane off the roughness without scratching the face of the glass. Some powdered flint is therefore spread over the plate, and rubbed along the surface by machinery, which, in the larger glass houses, is moved by steam. After the flint has removed the larger protuberances, emery powder is applied, first coarse, then finer, until by successive frictions the plate begins to exhibit a beautiful level. But all is not yet done; the *polishing* now follows. In this operation, pieces of wood covered with numerous folds of cloth, with wool between the folds, are used to bring the finished plate to its last degree of beauty. The friction of these cloth rollers would not, however, be effective without the use of a peculiar substance, called *colcloth* (the red oxide of iron), used for polishing other hard surfaces beside those of plate glass. Thus, from the fusion of the Lynn sand, the soda and lime, arises the product, which, having passed through the annealing oven, the grinding, and the polishing, is now to take its place amongst the highly elaborated productions of art.

3. *Crown Glass*.—This, though not so rich as the preceding, must not be passed over in silence, being the best species of window glass, and therefore contributing to the comforts of all those numerous families who inhabit the better class of houses. It is also composed of different materials from flint or plate glass, for, whilst much metal enters into these, little is allowed to mix with the ingredients from which crown glass arises. It is, therefore, much lighter and harder than those kinds into which so softening and heavy a substance as litharge (oxide of lead) enters. The substances used by different manufacturers vary exceedingly in their proportions, each having his own pet system of working. The best French crown glass is formed from one hundred parts of fine white sand, added to the same quantity of broken crown glass, and with these elements twelve parts of carbonate of lime, and four times that amount of carbonate of soda, are mingled. But in this country the following proportions are frequently used:—

Sand	200 lbs.
Kelp	330 "
Lime	15 "
Broken crown glass	200 "

When superior glass is required, other proportions are employed, whilst pearlash and saltpetre are substituted for the *kelp*. What is this *kelp*, which we have not hitherto had occasion to mention? It is the ashes of sea-weeds, which were formerly gathered in large quantities along the shores of Ireland and Scotland, and in some places cultivated by the landowners with the greatest care. But the alkaline matter, resulting from the burning of kelp, was too coarse and impure for use when a superior glass was required, and it is now rarely employed except in cases when fine material is not the object. The introduction of *Barilla*¹ at a moderate duty from abroad, and the reduction of the duty on salt from which alkali for the glass-works is now made, have freed our manufacturers from the necessity of using kelp in their operations. The most singular process in the making of crown glass is the *blowing*, and *whirling* of

the soft glass until it assumes the shape of a circular plate.

When the melted glass is reduced to a soft paste, the blower dips one end of a hollow iron pipe into the half fluid matter, which clings to the point, and, air being blown by the workman through the tube, swells into a small bubble. A solid iron rod, called a *punt*, is now fixed to one side of the hot sphere, from which the tube is disengaged, leaving a hole in the part where it had been inserted. The glass-worker now whirls the rod rapidly round, as a mop is trundled by an active housemaid; this motion causes the soft glass globe to expand into a kind of oblate spheroid. The aperture left by the tube becomes larger at every whirl of the punt, and the sphere swells out proportionately.

Thus the dilation increases till the spectator expects to see the semi-liquid globe break from the point of the rod. But whilst the stranger is gazing, the globe suddenly opens at the hole, and expands into a wide circular plate of glass. The centre to which the iron rod was attached, resembles a knot of glass in the midst of the piece, which rough part is only employed for the most ordinary purposes. The scientific thinker, who beholds the gradual expansion of the glass sphere as the whirling motion proceeds, cannot fail to be struck with the wide operations of a universal law, as he observes the form taken by the glass, and reflects on the shape communicated to the earth on which he lives by a similar motion. What is the reason of this expansion of the glass? It is clearly a result of the *centrifugal* force acquired by the rotatory motion, which drives off the circumference of the glass globe further and further from the centre. The shape of our globe, which swells out towards the Equator, arises also from its daily motion on the axis; and thus we see, in the operations of the glass-house and the structure of the globe, the working of a common law. If, as some geologists and astronomers think, the globe was formerly a *liquid* mass, it would naturally expand by its circular motion, just as the half fluid glass increases its bulk with the rotation of the rod. If window glass be carefully examined, it will often be found to possess a very slight tinge of green, produced by a substance called *zaffre*, which is thrown in to correct a yellow hue formed in the glass during the fusion. This *zaffre* forms by itself a beautiful blue, but when combined with the yellow tint, a soft green is the result, not often to be distinguished in the best glass without the minutest inspection. So powerful is the influence of the *zaffre*, that one ounce will purify a thousand pounds weight of the fluid glass.

(To be continued.)

A CHRONICLE OF ST. ALBANS.

WHILE public attention is directed to St. Albans, as about to become probably a Bishop's See, we have thought that a slight sketch of its past history might not prove unacceptable to our readers. Recourse has been had to its most accredited chronicles, and the following may be depended on, as a brief, but faithful summary of their testimony.

Cassibelaunus! Verulam! St. Albans!—It is perhaps impossible for the explorer into the bygone times of British history to find a spot of more varied and hallowed interest than that which has borne successively the names of Cassibelaunus, Verulam, and St. Albans!—In the year of the world 3950, or fifty-four years before the birth of our Saviour, when the greater part of Britain was but a tangled forest, or an uncultivated waste, it was described by Cæsar as a place of some strength and importance, "excellently defended by nature and by art."¹ Thus, on the very first page, as it

(1) A carbonate of soda procured in Spain, Sicily, Italy, and the Canaries, from two plants, one of which is called *Barilla*. 214,000 cwt. are imported yearly.

(1) "Egregiè naturâ atque opere munitum."

were, of the history of our country, we find inscribed the name of the city whose annals I have undertaken to make known.—Indeed, it is worthy of remark, that we have no *British* records to which to refer, and that the *earliest* notice of the first occupiers of the soil is to be found in the history of their conquest. Still, though the mists of ages envelope those far distant times, and though history lends not her wonted light to enable us to see them as they were—still fancy can penetrate the gloom, and recall, how *here* in rude magnificence the Prince of the Cassii held his court; how *here* the smoke from many an altar laden with human sacrifice, rose foul incense to the skies;—and how through the now silent hills, resounded from many a “sacred oak,” the death cries of the prisoners taken in savage warfare by the British Cassibelaun!—But death was at hand for the destroyers; Caesar, who never came but conquering and to conquer, led his proud legions to the Druid’s haunts, and the strong-hold of the British prince. —Caesar gave the word, and Cassibelaunus was no more! its very name perished, and scarce one stone remained upon another to tell what it *had* been. From its ruins, Verulam arose; which speedily became a place of note and of importance, being one of the chief cities situated on the great Roman highway—the still existing Watling-street. Of its flourishing state under its founders and first governors there can be no doubt, as Tacitus calls it a “municipium,” or town privileged to have a corporation or local government, which was granted only to places of magnitude and importance. Coins are also still extant with the name of Verulam inscribed upon them, which were struck there by the Romans, in commemoration of their victories.

Encompassed with walls and a moat, adorned by temples, palaces, and forums; abundantly supplied with money, and every comfort and luxury then known, and the seat of a powerful and enlightened local government, Verulam had probably reached the zenith of its glory and prosperity, when, in the time of the Emperor Dioclesian, that fearful persecution of the Christians began, which “ragged,” we are told, “with merciless fury throughout Britain for ten years, and in which many illustrious persons fell in testimony of their faith.”

It was in the beginning of the year of our Lord 293, that a British monk, travel-worn and foot-sore, flying from the destroyers of his home, (the stately monastery of Caerleon in Wales,) craved a refuge and protection, at the hands of a Roman and a Pagan.

That monk was Amphibalus,—and the Roman—he was Alban,—“a citizen of no mean city,” but one nobly born in Verulam. The old man prays for pity, with all the earnestness of one who sues for life,—still Alban hesitates. To harbour a Christian, if discovered, was certain death to him who dared to do so; should he then risk his life, to save that of a stranger to himself—an enemy to his nation, and an alien to the faith of his fathers? But hark! he hears the savage yells of the infuriated populace, who, having heard that a Christian has been traced to their city, and is even now “within their gates,” are thirsting for his blood!—nearer and nearer the sounds approach, and Alban no longer hesitates. He extends the right hand of protection and support to the outcast, and proves that, though a Pagan, he has a Christian’s heart.

Of a hidden chamber in the Roman’s house, Amphibalus became an inmate, and there, day by day, he was visited by his host. Meanwhile, the calm aspect, the dignified yet humble demeanour, of the monk, his unaffected piety, and the mildness with which he spoke of the persecutors who had turned him homeless and friendless upon the world, and who would willingly have drained the last drop of life-blood from his heart, all won upon the noble-minded Alban, and he conversed freely with his guest, for whom he soon entertained an esteem amounting to veneration. From reverencing the lowly monk, Alban came at length to venerate the

master whom he loved, and in whose service he had become a “man of many griefs.”

The Christian’s faith and hope were no longer forbidden subjects of conversation, but loved and cherished themes, and, ere many weeks had flown, at the name of *Jesus* Alban had bowed the knee. Rumour, however, had meanwhile been busy in the city, “given up unto idols,”—it had reached the ears of the Pagan Governor of Verulam that Alban was harbouring a Christian, and he ordered that strict search should instantly be made, and summary judgment be executed. Alban, hearing of the threatened storm, hastened to Amphibalus, made him change garments with himself, and bidding him, “God speed,” sent him forth from the city. The monk’s after fate no pen has recorded, but, it is more than probable, that, like his “son in the faith,” in his own blood, shed “by wicked hands,” his name is inscribed on the muster roll of “the noble army of Martyrs.”

Meanwhile, the Centurion, and his band of soldiers, sent to search for the “accursed thing” in Alban’s house, hasten to fulfil their merciless errand with blood-thirsty avidity, and, finding the supposed monk in the little chamber lately inhabited by Amphibalus, they fell on him with yells of savage triumph, and led him with mock honours to the Governor. He was at the time sacrificing to his gods, (or devils, as they are called by ancient chroniclers,) and, turning from the altar, he gazed on the victim of his bigotry. His altered dress could not hide from the discerning eye of the Roman, the noble form and countenance of Alban, and with an oath of awful import he exclaimed, “Whom have we here? this is no monk!” and looking on the prisoner, he asked in a voice of thunder, “Art thou not Alban? the enemy of Caesar and the friend of the accursed Christian?” “I am a Christian,” was the mild yet firm reply, and to all the questions put to him this was the only answer he ever gave. When straitly charged to tell what had become of the monk, he opened not his mouth, and, boiling with indignation and inflamed by religious bigotry, the Governor condemned him to die the death the other should have suffered, and gave orders for his immediate execution.

Alban, bedecked as a victim for the sacrifice, robed in purple, and adorned with flowers, was led with the sound of music, and the shouts of brutal triumph, beyond the walls of Verulam, and, on the opposite hill to the one on which the city stood, on the 17th day of June, in the year of man’s redemption 293, Alban exchanged this life for a better, and won a martyr’s crown.

Of the wonders attending the suffering of England’s proto-martyr, there are many monkish legends, of which, those that have been handed down to us by local tradition, are the following:—

To reach the place appointed for the execution, Alban and the people who followed in his train, had to cross the river Vir, and, as there was only a narrow bridge of planks thrown across it, much time must necessarily have been lost, whilst the multitude were passing over. Alban, longing for the glorious moment when he should seal his noble profession with his blood, and impatient of any delay, prayed that the waters might divide, and (so says tradition) Heaven heard his cry. As with Jordan of old, the waters stood upon an heap, on either side, and the people walked forth in the midst dry-shod. Awe-struck at this wonderful manifestation of Divine favour towards the saint, the executioner appointed to do the bloody deed refused to fulfil his office, and another was substituted in his place. But the height of Holmehurst was not yet gained, and as Alban toiled up the weary hill leading to it, he thirsted; praying for water, a spring gushed out at his feet, which still bears the name of the Holy Well.

Of the miracles performed by the blood of the martyr, nor how, as his head was severed from his body, the eyes of his executioner fell from their sockets and rolled upon the ground, it matters not to tell;

from these traditionary tales, I must return to matters of fact, and hasten to relate, how, ere half a century had flown, his remains were enshrined with all the honours due unto his memory.

In the year of our Lord 306, Constantine the Great assumed the Imperial Purple, and days of peace and of prosperity dawned upon the hitherto proscribed and persecuted Christians. The religion of the Cross became the religion of Rome and its dependencies, and Pagan supremacy was no more. How true it is that times of *prosperity* are the times of greatest danger to the Church, and that, when no enemies menace it from without, then do foes to its peace usually arise within its bosom.

Hardly was it established in Britain, ere its peace was disturbed by the Pelagian Heresy, which divided its councils and embroiled its members. Two learned bishops, (the one, Germanus of Auxerre, the other, Lupas of Troyes,) were sent from France to compose these differences, which they effected, we are told, at a Synod held in *Verulam*.

This painful duty performed, they turned their thoughts to one of a more pleasing nature, namely, that of doing honour to England's proto-martyr. His remains were collected by the pious Germanus, and *that* was a day of public rejoicing in *Verulam*, on which they, with the relics of other saints departed in the faith, were placed by him with due solemnities in a fitting shrine. For rather more than eighty years after this event, the city was blessed with prosperity and peace; but at the end of that time the clouds, which began to shroud the setting sun of Rome, cast over its satellites dark shadows, ominous of coming gloom. The frozen north poured forth, like a mountain torrent, hordes of her hardy children over the fertile plains of Italy; and the degenerate successor of the Cæsars, fearing lest the imperial city should be inundated and swept away, and that the whole empire would share with it a common ruin, recalled all the troops from the distant colonies, and Rome was no longer mistress of the world! The last Roman legion quitted this island A.D. 440, and Britain became once more the land of the *Britons*! But *they*, alas! were then no longer, what Julius Cæsar found them, brave, hardy, and impatient of the yoke! Accustomed to be protected, they knew no longer how to protect themselves; and, having been well content, while clothed in purple and fine linen, to fare sumptuously with the yoke upon their necks, they mourned over the day when they were loosed from the burden, and became once more free men! Hardly had the high-prowed vessels, which bore the Romans from the land of their adoption, been lost to the sight of the hundreds who watched their departure with fond regret, mingled with anxious forebodings, and bitterly expressed fears for the future, than those fears were realized, and the northmen were upon them! Their track was marked by fire, and each footstep was traced in blood! The resistance met by the Picts and Scots was feeble in the extreme, until they neared the proud city of *Verulam*. There the faithful few who still bore British hearts within their breasts had flocked to the standard of the last scion of their native princes, and under Peter Pen-drain they fought with intrepidity worthy their warlike ancestors. It was a well-contested field, a bloody fight; but the invaders had the force of superior numbers in their favour, and ere the sun had set the Picts were lords of *Verulam*. The groans which arose *that* day from the field of the dying and the dead, sounded as it were the death-knell of the glory of *Verulam*—it had departed, and for ever! From the Saxons, in the times of the Heptarchy, it suffered even more than from the Scots; by them it was levelled to the ground, and the insignificant little town, which afterwards occupied its site, bore not the time-honoured name of the city of the Roman, but that of *Wallingester*,—one unknown to fame, and hardly to be found upon the page of written history!

Thus have we seen arise, flourish, and perish, the British Cassibelannus, and the Roman *Verulam*: let us now hasten to the arising of the city of the martyr, the Christian St. Albans! It was in the year A.D. 796, (about 296 years after the battle fought at *Verulam*, between the British and the Scots, and soon after the sacking and demolition of that city during the wars of the Heptarchy,) that Offa, the founder of the monastery and town of St. Albans, ascended the throne of Mercia. He was an able and warlike prince, and finding the people he had to govern both brave and enterprising, he waged war in turn with the kings of all the surrounding states, some of whom he forced to pay tribute and acknowledge him their lord. Each acquisition of authority or territory, instead of satisfying his ambition, only inflamed it the more, and he determined to possess himself of the neighbouring and flourishing kingdom of East Anglia. The means for effecting this were suggested and acted upon by his queen, a bold bad woman, whose character history has loaded with crimes of the darkest hue. For some heinous crime, she was condemned by the King of France to be sent afloat in the open sea, in a small boat, and with a few provisions. Quite at the mercy of the winds and waves, she was drifted to the shores of Britain, and, having landed in Offa's dominions, she was brought into his presence, when her beauty and romantic adventures so won upon his compassion, and captivated his heart, that, forgiving or forgetting her crimes, he made her his wife. From the hand of the executioner, and a watery grave, she had been saved to fill up the measure of her guilt, and to suffer a still more dreadful punishment! "Swift to do evil," she no sooner heard that the king had set his heart on his neighbour's inheritance, than, like Jezebel of old, she determined to gratify him, at the expense of breaking all laws, both human and divine. Had the "powers of darkness," in infernal conclave, formed a plan for compassing the ruin of one hateful to their prince, it could not have been more inhuman in design, nor terrific in execution, than was that purposed against the youthful Ethelbert by the Lady Macbeth of British history, the blood-stained Drida! The young king of East Anglia was "making court," to the beautiful Elfrida, her youngest child, who, we are told, far from "like a misbehaved and sullen wench" pouting on her fortune and her lover, returned his affection, "with that excellence that angels love good men with." Indeed history describes them to have been equally virtuous, amiable, and devoted. And this very circumstance, which should have called forth every tender feeling in the mother's heart, she determined to "wrest to the destruction of the young prince, the ruin of her daughter's happiness, and to her own eternal shame." She made ready a marriage feast, and invited Ethelbert to her own chamber, there to wed the lovely and beloved Elfrida. He came! *then did her project gather to a head!* Pretending to send her attendants to call the bride, the perfidious Drida bade him, whilst awaiting her coming, to sit on a "right royal" seat, which she had prepared for him beneath a sumptuous canopy. Those words of sweetness from the lips of the deceiver, were as

"A knell,
That summoned him to heaven or to hell."

Guileless and unsuspecting, the prince reclined on the fatal seat—in an instant the floor gave way beneath him, and in a low dark chamber far below, he fell into the hands of hired assassins, who quickly dispatched him, by smothering him with pillows. Picture the dismay—the anguish—of the bride elect, on hearing of the murder of her "own true love," and being told that her mother was the cause and instrument thereof! With "a heart full of sorrow as the sea of sand," Elfrida sought the cloister, and, as a veiled nun—

"A most unspotted lily did she pass,
And all the world did mourn her."

Meanwhile tidings of this truly dreadful tragedy were brought to Offa, who in an ecstasy of grief "shut to" the door of his chamber, and forbade all access to his presence. There he remained in strict seclusion for many days, and, when he again came forth, his first act was giving command that the guilty Drida should be thrown headlong into a well! An awful death! just retribution for her many crimes! But, whether Offa were actuated by right feeling—whether he sacrificed his consort to a stern sense of kingly duty, knowing that "mercy but murders, sparing those that kill," is very doubtful.

"To show an unfelt sorrow is an office,
Which the false man does easy."

And the king's after conduct seems to prove that his ignorance of the wicked designs of his wife was only feigned; and his subsequent grief and indignation affected, on finding how hateful in the eyes of his subjects was the crime committed. For, hardly was the latter sentence against his hapless partner executed, than he seized the inheritance of her victim, and joined the kingdom of East Anglia to that of Mercia. Fearful testimony against himself,—going well nigh to prove, that, for the much coveted "parcel of ground," he had been willing the once loved Drida should steep her hands in blood, in order that he might reap the advantage, while she was made to pay the penalty! O closely woven tissue of dark sins! Soon did they rise like mocking demon forms to haunt his noontide path and midnight couch. "Uneasy lies the head that wears an" ill-got "crown," and sleep forsook the monarch's eyes, and peaceful slumber his eyelids. Each night in his soul's bitter anguish did he cry—

"Better be with the dead,
Than in the torture of the mind to lie
In restless ecstasy!"

To "cleanse the stuffed bosom of that perilous stuff which weighs upon the heart,"—a sense of untold guilt, Offa sought the confessional, and with the priestly absolution received command to build a stately monastery, and endow it with rich lands in expiation of his crime. To this he willingly acceded, giving, moreover, a tithe of all his "worldly goods" to "Holy Church," and undertaking for his "soul's health" a pilgrimage to Rome. This he accomplished in 791, when he renewed his promise of erecting a building, worthy to be dedicated to God and his Saints.

On returning to his native land, he turned all his thoughts towards the means he should adopt for performing his solemn engagement, and prayed earnestly to God, that, "as he had often delivered him from the danger and assaults of his enemies, and from the traps and snares of his wife, so he would vouchsafe to grant him further light and information to enable him to complete his vow of founding a monastery!"

This prayer, we are assured, (though, it must be confessed, on somewhat doubtful authority,) was answered by the voice of an angel, who, when the king was sojourning at Bath, not long after appeared by his bedside in the stillness of night, and bade him raise from the ground the remains of the blessed martyr Alban, place them in a noble shrine, and raise above it the stately edifice he proposed erecting. Thus was obviated the great difficulty he had hitherto met with in the choice of a fitting site for the monastery, and the selection of a Saint, on whom to bestow the honour of its dedication. No sooner had morning dawned than he despatched messengers to the nobles and prelates of his kingdom, commanding them to meet him at Watlingcester, on a day appointed. A goodly company of all ranks, sexes, and ages, accompanied the king on his journey, and, as they neared the place of their destination, they saw, to their great astonishment and delight, a bright and beaming light shining over it. This they regarded as a favourable omen; but another difficulty still awaited them, for, during the devastating wars carried on by the

Saxons, first against the Britons, and then against themselves, all trace of the martyr and the place of his sepulchre had been lost.

How to overcome this, Offa was at a loss to divine, when heaven, we are told, again interposed in behalf of the repentant king, and suddenly there "stood over" the summit of the hill of Holmechurst, a "ray of fire," like the wondrous star, which, as a beacon light, led the wise men of the east to the lowly manger of Bethlehem. With exceeding gladness, the bishops who accompanied Offa, (after having fasted, prayed, and distributed abundant alms,) proceeded to open the ground, whereon the miraculous light shed its encouraging beam; and there, to their inexpressible joy, they beheld the bones they had so earnestly sought, still resting unmolested in the same coffin in which Germanus had placed them 344 years before. At this "most joyful sight," all present, with one accord, "lift up their voice and wept." And a strange and most moving sight must that have been, of a warlike prince surrounded by a vast multitude of the great, the noble, and the fair, all mingling with his, their tears of gratitude and joy! All distinctions were for the time unheeded, or forgotten; and the haughty Thane, with the despised Briton,—the cloistered monk, with the worldly courtier,—the blue-eyed beauty of high descent, with the low born daughter of the serf,—each and all joined with the monarch and the slave in paying honour to the Saint! His remains were raised from the ground and carried in solemn procession to a little chapel without the walls of Verulam; which, from its insignificance and secluded position, had escaped the ruthless hands of the destroying Saxons. This cell the king decorated in every possible way, and there, on the first of August, 791, five hundred and seven years after his death, with a circlet of gold bound around his fleshless skull, bearing his name and title, the martyr was assigned to a temporary, but honourable resting-place. . . . Having chosen from the Monastery of Bec, in Normandy, a monk named Willegod, of piety and wisdom, to be appointed to superintend the building of the monastery he had vowed to erect, and to take the government of it when completed, Offa with great pomp laid the foundation stone thereof, on the very spot where Alban had laid down his life for the truth, and where his remains had been discovered by the light vouchsafed from heaven. Kneeling on the bare ground, with hundreds prostrate around him, the king pronounced the prayer of dedication, which he concluded by commending the house about to be built to the protection of "Thee, O Jesus! and to thee, O martyr Alban! and to thee, O Willegod! with maledictions on all who shall disturb it, and blessings on all who shall be its benefactors!"

(To be continued.)

SONNET.

META.

LIGHT dwells with shadows! mountains frown o'er vales!
Rocks have their bases hidden from our gaze;
The lightest airs precede the heaviest gales;
The hottest suns provoke the earliest dew!
Ships which shake out their white-winged spreading sails
Feel most the blasts that in their wake pursue;
Love's sweetest strain some long-lost joy bewails;
The toil of many is the gain of few.
Our fairest hopes, to full fruition grown,
In forms substantial lose ideal grace,
And, as we seek to clasp in our embrace
The full robed image, it hath turned to stone!
Thus fade our joys! and, as long years roll on,
Their shadows measure our declining sun!

THE VISION OF ST. JOHN'S EVE.

BY ANNABEL C—.

MAIDEN, o'er thy young blue eye
Droops thine eyelid heavily;
Deep thy guileless sleep;
Better were it far could thou
Ever slumber on as now;—
Thou wilt wake to weep.

Softly on thy forehead white
Falls the moonbeam's hallowing light,
Ev'n as the soul within;
As that light is pure and fair,
Like the souls of angels are,
Thou art free from sin.

'Tis the eve of good St. John;
Spirits gaze thy sleep upon,
Though thou know'st it not;
And they bear thy soul away
Far, without or stop or stay,
To a distant spot.

Bright the sun, and bright the sky,
Passing fair unto thine eye
Everything is there;
Field, and flower, and blossoming tree,
And the widely spreading sea,—
All are strangely fair.

Fairer seemed they to her then
In her sleep than haunts of men,
Shining wondrously;
And she felt—she knew not why—
Gazing on them from on high,
That her soul was free.

Then there came the morning pale,
Stealing through the curtain's veil
To her paler face:
And she woke, while on her brow
That strange dream hath even now
Left its cloudy trace.

Then she knew her doom was sealed,
And her gentle spirit steeled
Quietly to bear;
For she knew, if in that night
The soul bore anywhere its flight,
It died within the year.

When her mother saw her face,
Where there lay the cloudy trace
Of her boding dream,
Much she marvelled that her child
Thus had lost her spirits wild,
And so sad should seem.

Much she marvelled, day by day,
As she saw her fade away,
And she grieved sore;
For her laugh's clear ringing sound,
That even the deep spirit found,
She heard never more.

Day by day, and week by week,
Paler grew the maiden's cheek,—
Paler, paler still;
Patiently she bore her lot,
Patiently,—she murmured not
Against a higher will.

Thus she passed on towards the tomb,
In her youth's rich early bloom,
And no moan she made:
Never mourned she that the light
Of her day must die ere night,—
Must so early fade.

They bear her to a southern shore,
Trusting there may bloom once more
Roses on her cheek;
Fairest roses those would be,
They on earth could ever see,
The roses on *her* cheek.

Now the fluttering sails at rest,
The vessel on the water's breast,
Rocketh to and fro;
Then they bear her to the shore,
Which she never may leave more,
While their hearts are woe.

Then she knoweth well the shore,
And she knows that never more
Will her steps return
From beneath its shining sky,
To the home for which her eye,
Evermore doth yearn.

Bright the sun, and bright the sky,
Passing fair unto her eye
Everything is there;
Field, and flower, and blossoming tree,
And the widely spreading sea,—
All are strangely fair.

For it is the land that shone
When the eve of good St. John
Told what should betide;
Then, as changed the night for day,
Gently passed her soul away;—
So the maiden died.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

PAINFUL DUTIES OF THE SCHOOLMASTER.

THERE is neither fortune nor fame to be acquired in fulfilling the laborious duties of a village schoolmaster. Doomed to a life of monotonous labour, sometimes requited with ingratitude and injustice by ignorance, he will often be oppressed with melancholy, and perhaps sink under the weight of his thankless toil, if he do not seek strength and courage elsewhere than in the views of immediate and personal interest. He must be sustained and animated by a profound sense of the moral importance of his labours. He must learn to regard the austere pleasure of having served mankind, and secretly contributed to the public weal, as a price worthy of his exertion, which his conscience pays him. It is his glory to aspire to nothing above his obscure and laborious condition, to make unnumbered sacrifices for those who profit by him, to labour, in a word, for man, and wait for his reward from God.—*Guizot*.

To be humble to superiors, is duty; to equals, is courtesy; to inferiors, is nobleness; and to all, safety: it being a virtue, that, for all her lowliness, commandeth those souls it stoops to.—*Sir Thomas More*.

FROM A PAINTING BY E. DUNCAN, ESQ., IN THE NEW BRITISH WATER-COLOUR EXHIBITION.

MYSTERIES OF VEGETABLE LIFE.

WHEN the child plucks a cowslip from its sunny bank, he pauses not to inquire respecting the secret wonders of its growth, but goes merrily from brake to dell, increasing the number of his flowery captives, and then hastening home, presents the rich bunch of wild beauties to his little sister for a fanciful wreath. With similar emotions may the man nurtured in the school of Art behold the flowery kingdoms, as tribe after tribe emerges from the secure retreats where the echoes of the north wind have been unheard, and the keen frosts of winter unfelt. He is content, with gazing on the beautiful vision, and delights to enrich his imagination with the bright images suggested by a thousand delicate flower bells trembling in the evening breeze, and "seeming, in the car of fancy, to utter a fairy peal of melody. But there are also times when reason proposes her questions respecting these creations of the spring, and urges the mind to look beyond that veil of material beauty which so often hides the wonderful workings of God from the eyes of men. It is undoubtedly much easier to ponder with a soft and dreamy delight on the fascinations of the *visible*, than to go on a voyage of careful examination into those realms of natural science, which free not their mysteries on our view, but quietly wait for the investigations of men. We must ever remember, that, if "the works of the Lord are great," so is it declared, they are "sought out by all them who have pleasure therein." Let us, therefore, at certain times turn from the luxury of seeing the beautiful, to the work of studying the hidden wonders on which all the visible charm of nature depends. The various forms of vegetable life must, at this season, attract the attention of all, from the peasant, passing in the grey dawn of the morning, through lanes adorned with wild flowers, to the Queen, who beholds the opening beauties of Windsor park and forest.

Amongst the mysteries of vegetable life must be mentioned the system of air-cells, which the researches of botanists have detected. These are hollows found in different parts of plants, and, being filled with air, doubtless contribute to preserve the vitality of the vegetable, or increase its reproductive powers. Great numbers of such cells are found under what may be called the *stems* of plants, and are exceedingly numerous in the various aquatic species. Thus the graceful stem of a Calla (or Arum), which appears but a mass of soft, green, starchy substance, presents an elegant arrangement of air-cells into which the atmospheric gases pour their energies. Plants and animals have a resemblance in this respect; the lungs of the latter being but a complicated machine to act upon the air, whilst the air-cells of the former imitate a somewhat similar mechanism: its use is to cause off our most delicate flowering vegetables. Some may have concluded against the use of such an engineering term as "mechanism" in connexion with the beauties of the floral kingdom. But let us assure the lady or gentleman, as the case may be, that the most refined engineering, and the highest mechanism, are displayed by quiet violets in their leafy smokes, and by the numerous flowers which give a grace to our morning glories, and our conservatories. The mechanism of nature is not a more appropriate expression, than the mechanism of a flower; for numerous are the contrivances by which life is imparted and preserved in summer days.

That these air-cells are connected in the same important way with the life of a plant, is evident from the regu-

larity with which they are placed around the stem and branches. Hundreds of little artistically constructed reservoirs meet the eye of him who examines the architecture of many water-plants, or beholds with delight the fine air-tubes in stems appearing to the eye but a solid mass of vegetable. As much regularity and symmetry can sometimes be detected in these cell systems, as in the arrangement of a city, planned and erected by the genius of some great architect.

But these are not the only hollows which excite the admiration of the botanist: others exist throughout the most solid portions of plants, and in the heart of oak exhibit their minute caves. Let the reader take up a piece of deal, mahogany, or other wood, and ask, What is this substance?—What is its *basis*, that from which it chiefly rises? Perhaps he has not hitherto suspected that wood is but a mass of globes, that the trunk of a tree is composed of myriads of spheres, so small that the dimensions of many are not equal to the 500th part of an inch. Thus, in a fragment of wood about the size of a marble, ten millions of such minute circles may exist. These cavities may be seen by the unaided eye, in every piece of wood; in the hard mahogany of the table or writing-desk, or in the trunk of a tree just felled: it is, however, through the microscope that we discern the full development of this vegetable cell-system, and ascertain that some of the walls of seed-caves are formed from fine plates of vegetable matter, not more than the 2000th part of an inch in thickness.

The first element of vegetable life appears to exist in such exceedingly minute cells,—for the whole growth of the largest oak may be traced to a dark speck, not exceeding one 60,000th of an inch in diameter, placed in the middle of a hollow filled with transparent fluid. Vegetables not only arise from these atomic spheres, but their whole substance is composed of such circular bodies. Thus, the globular form appears diffused through the universe, being found in the stars and planets, in the atoms of fluids, (such as water, and blood,) and in the organization of plants. A vegetable may, therefore, be said to contain within itself a whole system,—a universe, of globes, each being hollow, and filled by some fluid, the workings of which are as necessary to the well-being of that particular plant, as the movements of the heavenly bodies to the stability of the solar system. The laws, too, which regulate the operations of these countless hosts of botanical spheres, are the same with those which determine the sweep of a comet's path, or the movement of the sun and all the planets round their common centre of gravity. What are the causes which bind these vegetable globules together? which fill them with fluids of different kinds, and form, from such almost invisible pulps, the mast of the hundred-gun ship, the rich colours of the tulip, or the tints of the rose? These are questions involved in mystery: we may elaborate our guesses, and utter, with the solemn look of mystified gapers, the words—"Electricity!" "Attraction!" and such like phrases; but still the darkness lowers over our philosophy, nor does light appear in reply to our cabalistic mutterings. Thus the mind, whilst grasping at infinity, and looking upon the circle of things created as a field for the victories of the understanding, finds her genius baffled by a weed turned up by the plough. The cells of a plant, and the delicate structures of the vegetable membranes, puzzle the keenness which can detect the past history of the earth, and read the chronicles of a bygone world in the cleft recesses of the Andes or Himalayas. It must, however, be evident, that the simplest vegetable is a most complex structure, and possessed of a machinery by which all the singular productions of flowers, the diversity of colours, and the whole charmed circle of vegetable beauty, spring into a luxuriant and rejoicing life.

So extensive is the influence of the delicate tissue organization in plants, that botanists have been compelled to classify the various kinds of such structure

observed in the thin membranes of vegetables. When the interior of a branch or stem exhibits multitudes of fine lines, the tissue is called *fibrous*, and may be likened to a cord spun from a number of threads. These fibres are often not more than 1-10,000th of an inch in thickness, and some are supposed to be hollow, and filled with a transparent fluid, which may bear the same relation to the life of a plant as the blood of animals to their existence. The *solidity* of the fibrous threads is asserted by some, and upon this delicate question philosophers may debate with as much earnestness as upon some more stirring problem in human history; but the reader will probably feel little desire to enter on so abstruse a discussion. It is not, however, useless for him to know, that there is something in the leaf of a cactus or a campanula which excites the curiosity, while it baffles the skill, of first-rate physiologists. It is well to feel how closely around us the mysterious presses, lest we forget the wonders of the Divine works, amid the common things and pursuits of our daily life.

The next class of tissue structure is called the *cellular*, in which the whole substance of the plant is composed of a countless host of minute cells, formed of matter so delicate and transparent, that the finest productions of human art would resemble coarse canvass, if brought into comparison with these elegant membranes. Each cell is placed close to the next; and as all generally possess a globular form, the shrub or tree may be considered as consisting of an accumulation of spheres. This is most abundant in the more delicate plants, and fruits; and he who crushes a strawberry may feel assured, that thousands of crystal vases have been shivered by the act, and their rich fluid poured out as wine from shattered bottles. These cells frequently assume other forms than the spherical; sometimes exhibiting layers of little cubical bodies, resembling fairy-like goma, cut into tiny plates, from which a poet might form a palace for Oberon or Titania. Often these cavities take a starry shape, and exhibit to the scrutinizing naturalist an endless diversity of elegant outlines, whilst, at other times, he observes the tissue arranged in the form of columns, as if supporting the roof of some minute floral temple. These various cells may be regarded as the laboratories of the plant, in which the fluids are prepared by a wonderful system of silent and invisible chemistry. They are at first filled with a clear liquid; this changes into starch, and thus exhibits a decisive proof, that powerful agencies have been operating on the fluid. We soon find a resinous substance in the cells, which is supposed to furnish the *colouring* matter to the sap, and from it proceed the various oils and gummy matter supplied by many plants. Thus, in millions of cells invisible to the human eye, a secret chemistry works through every spring, and summer, with unerring results, in all the regions of the globe. We gaze with surprise at some development of human art when the metallurgist produces his bright metal from the rude ore, or when the glass-worker brings his transparent production from a heap of ashes and sand; but around us, and beneath our very feet, in our lanes and gardens, more wonderful phenomena exist, bearing powerful witness to the all-glorious workings of God in the world of matter. What a witness to His ever present agency are the delicate cells of plants, in which He works as gloriously as in the more visible operations of the celestial movements.

We may now notice a peculiarity in vegetation which has excited the most searching inquiries of studious botanists; we allude to the singular *winding* structure exhibited in many plants; so that the tissue tends to grow in *spirals*, and produces a series of convolutions on the stems and branches. The most careless man must have observed this in climbing shrubs, the tendrils of which generally wind in a fixed direction, some species turning from left to right, others from right to left, and a few present us with alternations of such convolutions, twisting in one direction for a space, and

higher up in the opposite. From what principle do these plant-fingers arise; what causes directs them when to turn to the right, and when to the left? The question is one which a prattling child may put to its nurse, but to furnish a sufficient reply has hitherto perplexed the acutest thinkers.

Some reader, unconscious of the grand mysteries to which *little* things may supply the key, will probably exclaim, "And why should man employ his lofty intellect, and waste his imagination, in meditating over the twistings of a weed? What matters it whether the peatendrill turn east or west, north or south?" Let such a one learn that a high importance may in some way attach to a fact, which man, with all his powers of research, and the methods of the Baconian philosophy at his disposal, cannot understand. Surely it is not a trifle which thus lifts up its head before man in his own world, and eludes his deepest scrutines. Such studies would not be useless did they only tend to restrain our exaggerated notions of the powers of the human intellect, of which we sometimes speak as if it were the lord of nature, and the diviner of surrounding mysteries. To be baffled by a fact in the history of a weed, must surely recall our vaunting spirits to a juster apprehension of their weakness than we are wont to cherish. But such studies are not so unworthy men of the highest knowledge and the most comprehensive understanding as some may suppose. Goethe, the great German poet, whose genius dwelt amid the strange life of the "Faust," and depicted the depths of tempted hearts, found in this subject—the spiral tendency of vegetation—a theme full of interest for his mind. One remarkable fact connected with this spiral structure is the peculiar arrangement of the leaves round the stems of many plants. If the reader will examine the branch of an apple or pear-tree, and observe the position of the leaves, he will see that a thread passed round the twig close by each leaf, will form what is called a spiral. And the convolutions of these leaves follow a peculiar mathematical law, so that a certain number of turns make one spiral, upon which a fixed number of leaves is found. To express this fact, botanists have called in the aid of arithmetical fractions; thus in one species of digitalis, we find that eight turns are made before the spiral is completed, and that twenty-one leaves exist along the whole line of the convolution; to express this we write $\frac{8}{21}$; the upper line,

or numerator, denotes the number of *windings* round the stem in a spiral, and the bottom line, or denominator, the number of leaves. Such a fraction, therefore, represents one system of spirals, many of which may exist upon a branch. The reader may perhaps ask, "What is the difference between a *turn* and a *spiral*?" Suppose the first leaf of a spiral be observed, and the reader follows the leaves *once* round the branch till he comes *exactly over* the first leaf; if another leaf or bud be in that spot, then the spiral will be completed in one turn; but if not, let him continue to follow the leaf line till he again comes over the first bud; if a leaf be in that part of the stem, the spiral is finished in two turns. Thus the botanist forms his systems of spirals, which the mighty causes working in the silent depths of nature had previously produced. As we know not the causes of these appearances in vegetation, neither can we at present say what peculiar results may hereafter flow from the recognition of such laws. But the first great object is to notice the facts in nature, then to extract a meaning which may lead to further discoveries. The spirals and twistings of plants may be the key to unlock the recesses of some hidden power now working beneath a thick veil, through which neither physiological nor chemical skill can pierce. Whenever, therefore, the reader observes the tendrils of a honeysuckle, or the spirals along a pear-branch, he may feel that in such a simple fact he beholds the boundary line of human knowledge in that direction; all beyond may be most marvellous, most overpowering in its displays of the

Divine glory, and angels or the enlightened spirits of the just may decipher the full meanings; but to us it is a mystery.

But, if the arrangements of vegetable tissues are surprising, their composition is no less wonderful. Consider for a moment the variety of materials which form a plant. That the substances which enter into the bulk of a mountain, and form huge chains of Alpine steepes, should also contribute to the existence of a rose, and form part of a tulip, does not appear at first a probability. *Crystalline* bodies of exceeding minuteness are found to exist in the cells of vegetables, and these are formed of what is called oxalate and phosphate of lime. The former consists of lime mixed with oxalic acid, and the latter is a compound of phosphoric acid and lime, which form the substance called bone, in animals. Here, then, we have another of those *points of union* which so often startle us when beholding the workings of the material universe; animals and vegetables, with all their diversities, possess—one in the bones, the other in the crystalline cells—a common substance. We also find starch, alum, sugar, the elements of flint and potash, in various parts of flowers and shrubs. Thus the simplest plant may be regarded as an epitome of the world itself, as it contains within its leaves and branches the elements which compose, in their accumulated masses, the crust of the earth.

Another singular circumstance in botanical history is the astonishing difference in vegetable nature, which a slight variety in some element of the plant frequently produces. Thus if we take 1000 parts of purest crystallized sugar, we find it to consist of 560 of water and 440 of carbon. Now it will be admitted that starch and sugar are two very distinct substances, yet how clear is the resemblance in their constituent elements. Twelve parts of water added, and twelve of carbon subtracted, will suffice to produce sugar instead of starch, whilst twelve parts of carbon added, and twelve of water subtracted, produce starch instead of sugar. What is the cause which gives to a few atoms of water and carbon such power? Here again we find the mysteries of the universe rising up, and refusing to answer our queries. No science with which we are at present acquainted enables us to detect the hidden might which regulates the progression of vegetable life, and draws an undistinguishable line between the most diverse substances. Turn from this subject and consider for a moment one peculiarity in the roots of plants, the tendency to *descend*. What so constantly draws the root in a direction opposite to the stem? Silent must all the schools of philosophy remain while such an inquiry is echoed. If we are willing to amuse ourselves with words, it is doubtless easy to say that "the root descends in search of food into the earth." But what causes such a descent? is again the perplexing question, which must compel the observer of phenomena to confess that something strangely mysterious is at work somewhere, and we see it not. Again, what a subject for long trains of speculation does the *vitality* of seeds suggest. The principle of life exists in one of these little cells for three thousand years, and then comes forward with its merry green, to look upon the world, and mark the changes which have passed over its fields since the days of the Pharaohs. It is not the mere seed which has been preserved, as in a kind of vegetable mummy, but the life has remained through so many ages, waiting for the moment when a revelation of its energies should be possible. There is nothing like this in animal existence, and it is as if one of the mummies in the British Museum should be revived by the warmth of summer and the noises of the surrounding world, and utter its old language, learned in Thebes or Memphis, in the ears of the modern Londoner. Something like this has been witnessed in vegetable history, when seeds taken from embalmed subjects have been sown, and spring up as bravely as their kindred had done on the banks of the Nile in the days of Joseph. Here again is a mystery over which

we may pore for long ages in vain without seizing the truth behind.

Such are a few of the hidden wonders in plants which compel us to feel that in leaves, branches, roots, tissue spirals and seeds, the All Wise is ever working with a power, the full displays of which no eye of man has seen, though enough is evident to nourish the spirit of adoration, and prompt a ceaseless *Te Deum* of the heart.

W. D.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. VI.

THE RIDDLE Baffles ME!

THE post next morning brought a letter from Mr. Vernon, to say, that, as he found the business on which he was engaged must necessitate his crossing to Boulogne, he feared there was no chance of his being able to return under a week, but that, if it should be inconvenient for Mrs. Coleman to keep Miss Saville so long at Elm Lodge, he should wish her to go back to Barstone, where, if she was in any difficulty, she could easily apply to her late hostess for advice and assistance. On being brought clearly (though I fear the word is scarcely applicable to the good lady's state of mind at any time) to understand the position of affairs, Mrs. Coleman would by no means hear of Miss Saville's departure; but, on the contrary, made her promise to prolong her stay till her guardian should return, however long it might be before that happy event should take place, which, as Freddy observed, involved the remarkable fact, that if Mr. Vernon should be drowned in crossing the British channel, she (his mother) *would have put her foot in it*. The same post brought Freddy a summons from his father, desiring him, the moment he returned from Bury with the papers, to proceed to town immediately. There was nothing left for him, therefore, but to deposit himself upon the roof of the next coach, blue bag in hand, which he accordingly did, after having spent the intervening time in reviling all lawyers, clients, deeds, settlements, in fact, every individual thing connected with the profession, excepting fees.

"Clara and I are going for a long walk, Mr. Fairleigh, and we shall be glad of your escort, if you have no objection to accompany us, and it is not too far for you," said Mrs. Coleman, (who evidently considered me in the last stage of a decline,) trotting into the breakfast room, where I was lounging, book in hand, over the fire, wondering what possible pretext I could invent for joining the ladies.

"I shall be only too happy," answered I. "and I think I can contrive to walk as far as you can, Mrs. Coleman."

"Oh! I don't know that," was the reply, "I am a capital walker, I assure you. I remember a young man, quite as young as you, and a good deal stouter, who could not walk nearly as far as I can; to be sure," she added as she left the room, "he had a wooden leg, poor fellow!"

I soon received a summons to start with the ladies, whom I found awaiting my arrival on the terrace walk at the back of the house, comfortably wrapped up in shawls and furs, for, although a bright sun was shining, the day was cold and frosty.

"You must allow me to carry that for you," said I, laying violent hands on a large basket, between which and a muff Mrs. Coleman was in vain attempting to effect an amicable arrangement.

"Oh, dear! I'm sure you'll never be able to carry it—it's so dreadfully heavy," was the reply.

"Nous verrons," answered I, swinging it on my forefinger, in order to demonstrate its lightness.

"Take care,—you musn't do so!" exclaimed Mrs. Coleman, in a tone of extreme alarm; "you'll upset all my beautiful senna tea, and it will get amongst the slices of Christmas plum-pudding, and the flannel that I'm going to take for poor Mrs. Muddles's children; do you know poor Mrs. Muddles, Clara, my dear?"

Miss Saville replied in the negative, and Mrs. Coleman continued.

"Ah! poor thing! she's a very hard-working, respectable, excellent young woman; she has been married four years, and has got six children,—no! let me see,—it's six years, and four children,—that's it,—though I never can remember whether it's most pigs or children she has,—four pigs did I say?—but it doesn't much signify, for the youngest is a boy, and they're all very dirty, and have never been taught to read, because she takes in washing, and has put a great deal too much starch into my night-cap this week—only her husband drinks—so I musn't say much about it, poor thing, for we all have our failings, you know."

With such like rambling discourse did worthy Mrs. Coleman beguile the way, until at length, after a walk of some two miles and a half, we arrived at the cottage of that much-enduring laundress, the highly respectable Mrs. Muddles, where in due form we were introduced to the mixed race of children and pigs, between which clearer heads than that of Mrs. Coleman might have been at a loss to distinguish; for, if the pigs did not exactly resemble children, the children most assuredly looked like pigs. Here we seemed likely to remain for some time, as there was much business to be got through by the two matrons. First, Mrs. Coleman's basket was unpacked, during which process that lady delivered a long harangue, setting forth the rival merits of plum-pudding and black draught, and ingeniously establishing a connexion between them, which has rendered the former nearly as distasteful to me as the latter ever since. Thence glancing slightly at the over-starched night-cap, and delicately referring to the anti-tea-total propensities of the laundress's spouse, she contrived so thoroughly to confuse and interlace the various topics of her discourse, as to render it an open question, whether the male Muddles had not got tipsy on black draught, in consequence of the plum-pudding having over-starched the night-cap; moreover, she distinctly called the latter article "poor fellow!" twice. In reply to this, Mrs. Muddles, the skin of whose hands was crimped up into patterns like sea-weed, from the amphibious nature of her employment, and whose general appearance was, from the same cause, moist and spongy, expressed much gratitude for the contents of the basket, made a pathetic apology to the night-cap, tried to ignore the imbibing propensity of her better half; but, when pressed home upon the point, declared, that when he was not performing the Circe-like operation of "making a beast of his-self," he was one of the most virtuous of men; and finally wound up by a minute medical detail of Johnny's chilblain, accompanied by a slight retrospective sketch of Mary Anne's last whitlow. How much longer the conversation might have continued, it is impossible to say, for it was evident that neither of the speakers had by any means exhausted her budget, had not Johnny, the unfortunate proprietor of the chilblain above mentioned, seen fit to precipitate himself, head-foremost, into a washing-tub of nearly scalding water, whence his mamma, with great presence of mind and much professional dexterity, extricated him, wrung him out, and set him on the mangle to dry, where he remained sobbing, from a vague sense of humid misery, till a more convenient season.

This little incident reminded Mrs. Coleman that the boiled beef, preparing for our luncheon and the servant's dinner, would inevitably be overdone, and induced her to take a hurried farewell of Mrs. Muddles,

though she paused at the threshold to offer a parting suggestion as to the advisability, moral and physical, of dividing the wretched Johnny's share of plum-pudding between his brothers and sisters, and administering a double portion of black draught by way of compensation, an arrangement which elicited from that victimized child a howl of mingled horror and defiance.

We had proceeded about a mile on our return, when Mrs. Coleman, who was a step or two in advance, trod on a slide some boys had made, and would have fallen had I not thrown my arm round her just in time to prevent it.

"My dear madam," exclaimed I, "you were as nearly as possible down; I hope you have not hurt yourself."

"No, my dear—I mean—Mr. Fairleigh; no! I hope I have not, except my ankle; I gave that a twist somehow, and it hurts me dreadfully; but I daresay I shall be able to go on in a minute."

The good lady's hopes, however, were not destined in this instance to be fulfilled, for, on attempting to proceed, the pain increased to such an extent, that she was forced, after limping a few steps, to seat herself on a stone by the way-side, and it became evident that she must have sprained her ankle severely, and would be utterly unable to walk home. In this dilemma, it was not easy to discover what was the best thing to be done—no vehicle could be procured nearer than Hillingford, from which place we were at least two miles distant, and I by no means approved of leaving my companions in their present helpless state, during the space of time which must necessarily elapse ere I could go and return. Mrs. Coleman, who, although suffering from considerable pain, bore it with the greatest equanimity and good nature, seeming to think much more of the inconvenience she was likely to occasion us than of her own discomforts, had just hit upon some brilliant, but totally impracticable project, when our ears were gladdened by the sound of wheels, and in another moment, a little pony-chaise, drawn by a fat, comfortable-looking pony, came in sight, proceeding in the direction of Hillingford. As soon as the driver, a stout, rosy-faced gentleman, who proved to be the family apothecary, perceived our party, he pulled up, and, when he became aware of what had occurred, put an end to our difficulties by offering Mrs. Coleman the unoccupied seat in his chaise.

"Sorry I can't accommodate you, also, Miss Saville," he continued, raising his hat; "but you see it's rather close packing as it is; if I were but a little more like the medical practitioner who administered a sleeping draught to Master Romeo, now, we might contrive to carry three."

"I really prefer walking such a cold day as this, thank you, Mr. Pillaway," answered Miss Saville.

"Mind you take proper care of poor Clara, Mr. Fairleigh," said Mrs. Coleman, "and don't let her sprain her ankle, or do any thing foolish, and don't you stay out too long yourself and catch cold, or I don't know what Mrs. Fairleigh will say, and your pretty sister, too,—what a fat pony, Mr. Pillaway; you don't give him much physic, I should think,—good bye, my dears, good bye,—remember the boiled beef."

As she spoke, the fat pony, admonished by the whip, described a circle with its tail, frisked with the agility of a playful elephant, and then set off at a better pace than from his adipose appearance I had deemed him capable of.

"With all her oddity, what an unselfish, kind hearted, excellent little person Mrs. Coleman is!" observed I, as the pony-chaise disappeared at an angle of the road.

"Oh! I think her charming," replied my companions warmly, "she is so very good-natured."

"She is something beyond that," returned I; "mere good nature is a quality I rate very low; a person may be good-natured, yet thoroughly selfish, for nine times out of ten it is easier and more agreeable to say 'yes'

than 'no'; but there is such an entire forgetfulness of self apparent in all Mrs. Coleman's attempts to make those around her happy and comfortable, that despite her eccentricities, I am beginning to conceive quite a respect for the little woman."

"You are a close observer of character, it seems, Mr. Fairloagh," remarked my companion.

"I scarcely see how any thinking person can avoid being so," returned I; "there is no study that appears to me to possess a more deep and varied interest."

"You make mistakes, though, sometimes," replied Miss Saville, glancing quickly at me with her beautiful eyes.

"You refer to my hasty judgment of last night," said I, colouring slightly.

"The mournful words of your song led me to conclude that in one instance, high spirits might not be a sure indication of a light heart; and yet I would fain hope," added I, in a half-questioning tone, "that you merely sought to inculcate a general principle?"

"Is not that a very unusual species of heath to find growing in this country?" was the rejoinder.

"Really, I am no botanist," returned I, rather crossly, for I felt that I had received a rebuff, and was not at all sure that I might not have deserved it.

"Nay, but I will have you attend; you did not even look towards the place where it is growing," replied Miss Saville, with a half-imperious, half-imploing glance, which it was impossible to resist.

"Is that the plant you mean?" asked I, pointing to a tuft of heath on the top of a steep bank by the roadside.

On receiving a reply in the affirmative, I continued; "then I will render you all the assistance in my power, by enabling you to judge for yourself." So saying, I scrambled up the bank, at the imminent risk of my neck; and after bursting the button-holes of my straps, and tearing my coat in two places with a bramble, I succeeded in gathering the heath.

Elated by my success, and feeling every nerve braced and invigorated by the frosty air, I bounded down the slope with such velocity, that, on reaching the bottom, I was unable to check my speed, and only avoided running against Miss Saville, by nearly throwing myself down backwards.

"I beg your pardon," exclaimed I; "I hope I have not alarmed you by my abominable awkwardness; but really the bank was so steep, that it was impossible to stop sooner."

"Nay, it is I who ought to apologize for having led you to undertake such a dangerous expedition," replied she, taking the heath which I had gathered, with a smile which quite repaid me for my exertions.

"I do not know what could have possessed me to run down the bank in that insane manner," returned I; "I suppose it is this fine frosty morning which makes me feel so light and happy."

"Happy?" repeated my companion incredulously, and in a half absent manner, as though she were rather thinking aloud than addressing me.

"Yes," replied I, surprised; "and why should I not?"

"Is any one happy?" was the rejoinder.

"Very many people, I hope," said I; "you do not doubt it, surely."

"I well might," she answered with a sigh.

"On such a lovely day as this, with the bright clear sky above us, and the hoar-frost sparkling like diamonds in the glorious sunshine, how can one avoid feeling happy?" asked I.

"It is very beautiful," she replied, after gazing around for a moment; "and yet can you not imagine a state of mind in which this fair scene, with all its varied charms, may impress one with a feeling of bitterness rather than of pleasure, by the contrast it affords to the darkness and weariness of soul within? Place some famine-stricken wretch beneath the roof of a gilded palace, think you the sight of its magnificence would give him any sensation of pleasure? Would it not

rather, by increasing the sense of his own misery, add to his agony of spirit?"

"I can conceive such a case possible," replied I; "but you would make us out all famine-stricken wretches at this rate: you cannot surely imagine every one to be unhappy?"

"There are, no doubt, different degrees of unhappiness," returned Miss Saville; "yet I can hardly conceive any position in life so free from cares, as to be pronounced positively happy; but I know my ideas on this subject are peculiar, and I am not very desirous of making a convert of you, Mr. Fairloagh; the world will do that soon enough, I fear," she added with a sigh.

"I cannot believe it," replied I, warmly; "true, at times we must all feel sorrow; it is one of the conditions of our mortal lot, and we must bear it with what resignation we may, knowing, that if we but make a fitting use of it, it is certain to work for our highest good; but, if you would have me look upon this world as a vale of tears, forgetting all its glorious opportunities for raising our fallen nature to something so bright and noble, as to be even here but little lower than the angels, you must pardon me if I never can agree with you."

There was a moment's pause, when my companion resumed.

"You talk of opportunities of doing good, as being likely to increase our stock of happiness; and, no doubt, you are right; but imagine a situation, in which you are unable to take advantage of these opportunities when they arise, in which you are not a free agent, your will fettered and controlled on every point, so that you are alike powerless to perform the good that you desire, and to avoid the evil you both hate and fear, could you be happy in such a situation, think you?"

"You describe a case which is, or ought to be, impossible," replied I; "when I say ought to be, I mean that in these days, I hope and believe, it is impossible for any one to be forced to do wrong, unless, from a natural weakness and facility of disposition, and from a want of moral courage, their resistance is so feeble, that those who seek to compel them to evil, are induced to redouble their efforts, when a little firmness and decision clearly shown, and steadily adhered to, would have produced a very different result."

"Oh! that I could think so!" exclaimed Miss Saville ardently: she paused for a minute, as if in thought, and then resumed in a low mournful voice, "but you do not know—you cannot tell; besides, it is useless to struggle against destiny: there are people fated from childhood to grief and misfortune—alone in this cold world—you have a sister?" she inquired, abruptly.

"Yes," replied I; "I have as good a little sister as ever man was fortunate enough to possess—how glad I should be to introduce her to you."

"And you love each other?"

"Indeed we do, truly and sincerely."

"And you are a man, one of the lords of the creation," she continued, with a slight degree of sarcasm in her tone. "Well, Mr. Fairloagh, I can believe that you may be happy sometimes."

"And what am I to conjecture about you?" inquired I, fixing my eyes upon her expressive features.

"What you please," returned she, turning away with a very becoming blush—"or rather," she added, "do not waste your time in forming any conjectures whatever on such an uninteresting subject."

"I am more easily interested than you imagine," replied I, with a smile; "besides, you know, I am fond of studying character."

"The riddle is not worth reading," answered Miss Saville.

"Nevertheless, I shall not be contented till I have found it out; I shall guess it before long, depend upon it," returned I.

An incredulous shake of the head was her only reply, and we continued conversing on different subjects, till we reached Elm Lodge.

THE RISE AND DECLINE OF CHIVALRY IN ENGLAND.

PART II.

"The knights are dust,
And their good swords are rust :—
Their souls are with the saints, we trust."

When shorn of all pomp and external decoration, when performed hastily, and in the battle field, the investment of a knight had ever some accompanying circumstances calculated to work upon the best feelings of the mind; and one of these circumstances inseparable from the ceremony was, that the honour was thought worthless, unless conferred by one of approved valour and conduct. After the battle of Marignan, Francis I. of France chose to receive knighthood from the hands of the Chevalier Bayard alone. "Le roy voulut grandement honorer, car il preint l'ordre de chevalerie de sa main. Il avoit bien raison, car de meilleur ne l'eust seu prendre."

Stern must have been the mould of him whose every feeling of chivalry was not aroused within him on receiving this honourable investment thus amidst the dying and the dead. There are instances on record, where a dying man has exerted every energy of his frame to muster strength to confer knighthood on his faithful esquire or page, as the dearest boon he could bequeath to him; and, on the contrary, it is well known that, after the termination of the strife at Agincourt, Henry V. knighted some brave Welsh soldiers even as they lay expiring. This may appear an outrageous outburst of the chivalrous spirit, and we are far from contending that its manifestations were at all times rigidly governed by reason. We read in the romances of the time, that, after the death of the renowned knight and warrior Lancelot du Lac, the right arm of the corpse was used in conferring the knightly accolade on a youth of high lineage and promise, Ysaic. We do not of course refer to the tradition as worthy of the slightest credence *in itself*; but, as these romances were undoubtedly pictures, though exaggerated ones, of the manners of the times, we have adduced the anecdote as correlative proof of our remark, that the honour of the accolade itself was enhanced by the high knightly character of the arm by which it was conferred. There can be nobody who has not heard of the renown of Sir Lancelot of the Lake.

The ceremonies of the degradation of a knight who had forfeited his claims to that estate were even more solemn than those of his inauguration. The formal degradation was, however, seldom resorted to except in the extremest cases, as there were many modes in which an unworthy cavalier might, as the modern phrase goes, be voted to Coventry, and be sufficiently punished without resorting to the extreme of public degradation. Some of the circumstances of this complete degradation were—the depriving him of his armour, which was taken from him piece by piece on a public scaffold, and broken and trampled under foot;—the proclaiming him a rebel, a traitor, and a faith breaker;—the pouring hot water over him, as if to wash away all trace of the sacred character of knight, with which he had been invested;—the reading a penitential psalm over him;—and in some places the ceremony was so extreme as to place him in a coffin, and read the service for the dead over him.

It is recorded of the wild Normans, that they spent the night before the battle of Hastings in fasting and prayer; and one feels it difficult to reconcile this circumstance with the accounts of their indifference to other religious ceremonies as compared with the Saxons. But, as chivalry progressed to its lustre, frequent prayer was always a habit of the knight, and especially before combat. On one occasion, when the French and English armies were going to engage, "quand vint le Vendredi au matin, les deux oste s'appareillèrent et

ouyrent la messe, chacun assigneur entre ses gens et en son logis, et se communierent et confesserent plusieurs."

Again: "En ce jour se levèrent les Anglois monté matin; et s'appareillèrent pour aller devant Caen. Puis ouit le Roy messe devant soleil levant; et après monta à cheval," &c.

Froissart's Chronicle abounds in similar instances.

But perhaps the most engaging characteristic of chivalry, as it was also its most pervading feature, was its *generosity*; or what we might perhaps, in modern phrase, describe as the perfect tone of gentlemanly feeling which it almost invariably displayed. To this did Lord Digby trust, judging others by his own standard, when he was taken prisoner in disguise at Hull, and confided his real name and dignity to the rebel governor, Sir John Hotham, who, not insensible to the chivalrous trust reposed in him by his lofty visitor, connived at his escape. By this feeling was King Louis VII. of France actuated when he refused to give up Becket to the messengers of Henry II. "Tell your king," said he, "it is the hereditary privilege of my crown to protect the unfortunate."

These beautiful results characterized the whole age of chivalry; but they had their origin in an infinitely more ennobling cause than any conventional mode of manners—even in that Christian charity which believeth, hopeth, and endureth all things. The religion of those days was doubtless imbued with superstition and bigotry, but it was heartfelt, sincere, and *influencing*, nevertheless. How influencing let one example suffice here. When Louis IX. was kept in hard durance by the sultan, and threatened by the most horrible tortures, the infidel monarch was suddenly assassinated by one of his own followers, who hanged to the French king, informing him of the deed. Louis was transfixed with horror, and, on the demand of the Mussulman to be knighted by him, peremptorily refused, though the sword of the ruffian was at his breast to compel his acquiescence. "When you become a Christian," said the undaunted monarch, "I will knight you." We are told that, subdued by the calm unmoved dignity of the king's manner, the murderer rushed from the chamber.

To illustrate further our meaning as to the generosity which the code of chivalry was intended to inculcate, and which was in fact a practical illustration of the divine precept, "Do unto others as ye would they should do unto you," take the following examples from many which lie before us.

In the time of Peter, king of Arragon, when the Spanish admiral, Roger de Luria, a Templar, arrived at the port of Malta, where was the fleet of Marsailles, having taken the provincials by surprise, some of his men cried out, "Now fall on." "God forbid," said he, "that I should attack them while they sleep; let the trumpet sound, and I shall wait till they are ready. Men shall not be able to say that I attacked sleeping men."

When the Duke de Montmorenci was wounded at the bridge of the Fresquel in 1632, he was within a few yards of his own party, who would have enabled him to escape, when suddenly his horse fell to the ground. The officers of the army opposed to him pretended not to see him, that his friends might have time to rescue him.

After the battle of Poitiers, the English and Gascon knights questioned their prisoners, upon their honour, as to what ransom they could pay without inconvenience, and they trusted implicitly to the statement made.

Take a domestic instance. In 1689 the Duc de Bourbon, on his return from an eight years' imprisonment in London, gave an entertainment to his relations and vassals, on which occasion his agent presented him an immense book, containing a list of the dissolutions of all his vassals during his absence. The noble-hearted man did not even open it, but, throwing it into the flames of the fire which burnt in the middle of the hall,

he turned with a severe look to the over-zealous agent, and asked if he had not a corresponding book of the services of his faithful tenants.

Instances might be multiplied *ad infinitum*, but the foregoing are sufficient to illustrate our meaning as to the prevailing tone of chivalry; opposing examples can certainly be cited, but they are the exceptions to the rule. The perfection of the chivalric character was in fact exactly what we should now picture that of a highly born, highly bred, Christian gentleman. The circumstances of tilt and tournament, of horse and armour, were mere excrescences—the foam of the billow, the bloom of the peach, the decorative misletoe of the life-giving oak; the ornament, not the substance; the shell, not the kernel; the mere gorgeous and attractive rind of the wholesome and nourishing fruit.

The high and palmy days of chivalry in England were undoubtedly those of Edward III. It had then reached its highest point of refinement, and since that time it has gradually declined; or, when a chivalrous "demonstration" has been made, it had more of the outward semblance than the inward strength. But, at the time of which we speak, the whole nation was imbued with the chivalric sentiment; so much so, that even the Lord Mayor, Aldermen, and Sheriffs—listen, ye degenerate turtle-lovers!—gave tournaments under their own auspices. Some of the court names of that day, Manny, Chandos, Audley, the Black Prince's comrades, will live for ever; and so high was the universal estimation of this chivalric king, that his court was regarded as the "very judgment-seat of honour." He even projected the establishment of a Round Table on the model of Arthur's, and invited and courted in the most flattering manner chivalrous knights from France, Germany, and Spain; and numbers came, to whom Queen Philippa, with three hundred noble English ladies in her train, all habited in a rich and similar costume, did the hospitalities of the bower and the hall. But Philip of Valois, foreseeing the ill effects to himself of this institution, set up a similar one, and thus destroyed the (probably intended) effect of Edward's. It was on the failure of this scheme that the English king projected and effected another, which, thus originating in romantic feeling, exists at this day as the highest honour to which an English nobleman can aspire. We allude to the "Order of the Garter," which Edward now instituted, associating twenty-five of the most noble and valiant of his peers in a Brotherhood in honour of God, of the Virgin Mary, of St. George the Martyr, and of St. Edward the Confessor.

The idea of a blue garter as a badge of honour and brotherhood was not new. Richard I. associated himself in a sort of brotherhood with twenty-four knights, who pledged themselves to scale the walls of Acre; and that they might quickly be known to each other in the heat of the *mêlée*, each bound a strip of blue leather round his left leg.

St. George, a brave and nobly born soldier, who undauntedly remonstrated with Dioclesian on his persecution of the Christians, and suffered martyrdom in consequence, had ever been considered as especially the patron of military men, partly perhaps in consequence of his profession, and partly, very probably, because the Christian warrior, Constantine, instituted an Order in his honour. His fame was always great in the East, and it is said that he appeared to the Christian army in the Holy War before the battle of Antioch. How he came first to be considered as the patron saint of England seems uncertain. It might be that the English brought a strong impression of his fame from the East; or it may be, that his especial appearance to Richard I.—a recorded fact—before his own expedition against the Saracens, may have caused the royal hero to pay high honour to the martyr.

The saint is generally represented on horseback, tilting at a dragon, emblematical, learned clerks tell us, of his conquering the devil by faith and Christian forti-

tude—that potentate being always represented in the Apocalypse under the similitude of a dragon. The account of his killing the dragon, and delivering the princess, is not found in any of the early manuscripts of his life, but first occurs in a manuscript in the Ambrosian Library at Milan, written later than the age of the Crusades. The story had been brought from Palestine. Apocryphal as, we fear, we must allow it to be, perhaps there are yet some of our readers who will be pleased to renew their acquaintance with this treasured legend of their childhood. Our account is abbreviated from "an aunciente & ryghte noble Historye."

Immediately on his entrance into public life, St. George travelled from the city of Coventry into the territories of Egypt, "which countrey as then was greatly annoyed with a dangerous dragon; but, before he had journeyed fully within the distance of a mile, the silent night approached, and solitary stillness took possession of all living things. At last he espied an old poore hermitage, wherein he purposed to rest his horse, and to take some repast after his weary journey, till the sunne had renewed his morning's light, that hee might fall to his travell againe: but, entering the cottage, he found an aged hermit overworn with yceres, and almost consumed with griefe, with whom in this manner he began to confer:—

"'Father,' said he, 'for so you seem by your gravity, may a traveller for this night crave entertainment within your cottage, not only for himselfe but his horse: or is there some city neare at hand, whereto I may take my journey without danger?'"

The old man, starting at the sudden approach of St. George, in reply to him recounted a sorrowful history. He told him that the country had for twenty-four years been desolated by a terrible dragon, to whom every day was offered the body of a true virgin, whom he devoured. There was now but one left in all Egypt, the king's only daughter, who was the following day to be given up to the monster, unless redeemed by some brave knight, who should have her hand and the crown of Egypt as the guerdon of his valour.

"After this the noble knight, like a bold adventurous champion, entered the valley where the dragon had his residence, who no sooner had a sight of him, but hee gave such a terrible yell, as though it had thundered. The bignesse of the dragon was fearful to behold, for betwixt his shoulders and his taile were fifty foot in distance, his scales glistered as bright as silver, but were far harder than brass; his belly of the colour of gold, but bigger than a tun. Thus weltered he from his hideous den, and so fiercely assailed the sturdy champion with his venomous wings, that at the first encounter he had almost felled him to the ground; but the knight, nimbly recovering himself, gave the dragon such a thrust with his spear, that it shivered into a thousand pieces. Whereat the furious dragon so fiercely smote him with his venomous tail, that down fell man and horse, in which fall two of St. George's ribs were sore bruised: but, yet stepping backward, it was his chance to leap under an orange tree, which tree has such precious virtue, that no venomous worme durst come within the compass of the branches, nor within seven foot thereof; where this valiant knight rested himself until he had recovered his former strength: the fruit of the tree being of such an excellent virtue, that whosoever tasted thereof should presently be cured of all manner of diseases and infirmities whatsoever. So it was the noble champion's good and happy fortune a little to recover through the virtue of the tree, and to espy an orange which a little before had dropped down, wherewith he so refreshed himself, that he was in a short time as sound as when he began the encounter. Then kneeled hee downe, and made his divine supplication to heaven, that God would send him (for his deare Sonne's sake) such strength and agility of body, as to slay the furious and terrible monster: which being done, with a bold and courageous heart he smote the dragon under the

wing, where it was tender without scale, whereby his good sword ASCALON, with an easy passage, went to the very hilts through both the dragon's heart, liver, bone, and blood.

"During this long and dangerous combat, his trusty steed lay altogether in a swoon, without any moving, which caused the English champion with all speed to crush the juice of an orange into his cold mouth: the virtue whereof presently expelled the venomous poison, and he recovered his former strength."

Oh! for some of those same marvellous oranges in this our day and generation.

The death of the Black Prince gave a blow to chivalry which it never recovered, more especially as his son Richard II., though revelling in profusion and splendour,—feasting 10,000 followers every day, and employing three hundred servants in his kitchen alone—loving tilts and tournaments, and all the "pomp and circumstance" of chivalry—had none of the martial feeling which characterized his father and grandfather. Hotspur would have been by no means so prominent and conspicuous, had he fought in Edward the Third's day, as he was subsequently. The general spirit was too much subdued for even the chivalrous King Henry V. to revive, and the wars of the roses seemed to quench it altogether. Edward IV. a man of indomitable personal valour, indulged likewise in effeminate refinements and luxuries, diametrically opposed to the stern simplicity of the primitive chivalric character. Moreover he encouraged, more than any of his predecessors had done, the trade and commerce of the city, and protected and elevated the citizens. Here was, in fact, in the increase of trade, the germ whence emanated the downfall of the ancient chivalry of England.

Henry VII. was a great political economist, and, undoubtedly, a wise and far-seeing monarch. All his acts and legislations tended to repress that ardour for military renown which had theretofore been to Englishmen as their very life's blood. He encouraged commerce and manufactures in every possible way, and was a friend to learning and learned men. The great incitement to domestic conflict, the partizanship of the roses, was rendered a nullity by his marriage with the heiress of York; and the myriad lower retainers of noble houses, deprived of their military service and pay, naturally began to turn their minds to more domestic occupations to supply means for themselves and their families; and the lower orders as a body were gradually progressing to a station and accredited rank in the community heretofore unthought of.

In Henry the Eighth's reign tilts and tournaments were revived with a splendour and magnificence almost unheard of. But it was the flash appearance merely; the heart of the thing was wanting; they were merely ornamental amusements: and, though he himself was personally brave, we fully and unequivocally agree with the grave historian, who writes that "his conduct to his wives was any thing but chivalric."

In the days of Elizabeth even these shows and superfluities of tournaments declined; instead of tilt yards there were shows and spectacles. On her first entry, as queen, London was one theatre of stages and pageants; there was much speechifying, but no tilting.

On her subsequent progress, the pageants were gaudy and glittering, a barbarous mixture of pedantry and ignorance—'Mercury flying to meet her—not on his own pinions—but in a gilt coach.' These pageants were frequently temporary buildings, representing castles, palaces, gardens, rocks, or forests, as the occasion required, where nymphs, fawns, satyrs, gods, goddesses, angels, and devils, appeared in company with giants, savages, dragons, saints, knights, buffoons, and dwarfs, surrounded by minstrels and choristers; the heathen mythology, the legends of chivalry, and Christian divinity, were ridiculously jumbled together without meaning; and the exhibition usually concluded with dull pedantic

harangues, exceedingly tedious, and replete with the grossest adulation.¹ In these Elizabeth delighted, notwithstanding her masculine energies and highly cultivated mind; and so indeed did her father, King Henry VIII. who not unfrequently took a part in their enactment.

It is true that in this reign that glorious mirror of knighthood, Sir Phillip Sidney, lived and died; but there needs no farther proof of the general decline of the chivalric code, than the éclat which attaches to his name: three or four generations earlier he might still have been admired, revered, but it would have been amongst others. He would not have been cited solely.

But it was not enough that the warlike demonstrations of her ancestors were in this reign merely claimed; they were revived, but revived in caricature. In an entertainment at the tilt-yard in Westminster, the gallery wherein the queen sat was called the Castle, or Fortress of Perfect Beauty, and four noblemen, calling themselves the Foster-children of Desire, summoned the fortress to surrender, which of course it did not: then ensued the terrors of war,—cannon were shot off, one charged with sweet powder, the other with sweet water: and then there were stores of pretty scaling ladders, and the walls were assaulted with flowers and other such devices as might seem "fit shot for desire."

It is a wonder that the shades of our warlike Edwards and Henrys could rest in peace during such a demonstration.

Yet this queen was, like most of her ancestors, fearless of danger, and of undaunted mind. It was not to any individual influence, however high, that chivalry owed its decline. It was the progress of society, the uprise of the lower classes, the more enlightened education, and more extended information, of the higher ones, the great and general increase of trade, commerce, and manufactures, the use of fire-arms, and consequent disuse of lance and spear, all these reasons combined—in short, the institutions and enactments of chivalry had arisen in a rude age, engendered by, and calculated for, the necessities of that age; and when, by the gradual advancement of civilisation, and progression of society, this code became *passé* and inexpedient, it gradually sank and died away: revived at times by the influence of the leading spirits of the day, but only transiently—as the flame of a dying lamp will relume vividly from a sudden breath of air, though not the less surely and certainly expiring.

Such a transient illumination might, perhaps, the influence of the ill-fated prince of Wales, son to James I. have given to the cause of chivalry, had he lived. Finally, Charles I. conceded to his turbulent people the prerogative held by his predecessors, of compelling his vassals to assume knighthood, or pay a fine of redemption: and he closed, happily for him, an unhappy existence in a way, which had there existed one lingering spark of chivalry in the Commons of England, it could never have entered their hearts to imagine.

We conclude in the words of Burke, though we trust he is mistaken in his vaticination:—

"The age of chivalry is gone! That of sophisters, economists, and calculators has succeeded; and the glory of Europe is extinguished for ever."

AN ACCOUNT OF THE LIFE AND WRITINGS OF MADAME GUIZOT.²

We have seen that Madame Guizot was attached to the philosophy of the last century, less from choice than from opposition to reviving prejudices. She had of herself, and by the instinctive uprightness, purity, and disinterestedness which governed her, been able to

(1) See her receiving at Norwich, 1578.

(2) Concluded from p. 170.

reform her moral opinions; but in religion, in politics, even on literary questions, she still wavered, seeking for convictions, and feeling a want of truth and liberty, that she did not know how to satisfy between scepticism and prejudice. What her mind in fact wanted was not ideas but principles. Her new position was a school where she learned to remodel all her opinions. She penetrated into that order of ideas towards which all minds now tend, where all the real wants of a rational intelligence are appeased, in which an end is put to all question of the alliance of liberty and rule, of examination and faith, of reason and of truth. She rose by degrees to that tutelary faith which enlightens and strengthens, and makes the mind taste the noble pleasure of feeling itself altogether settled, yet at liberty, proud of its obedience, and yet free in its fetters.

The first advancement of Madame Guizot's mind in this new course is observable in the *Annals of Education*, a periodical compilation which her husband had undertaken, and which she has enriched by a number of articles which contain the germ of her greatest work. Her first collection of stories, entitled *Les Enfants*, which appeared about the same time, is composed in the same spirit. This kind of work is more difficult than it is brilliant: it must be simple without puerility, refined without affectation; it must be an interesting and yet a simple narrative, an elevated and yet familiar moral. Madame Guizot knew how to unite all these, and her tales have become the model of the style.

The Restoration opened the career of public affairs to her husband. Madame Guizot might now hope for a more quiet life, such as she had always wished for. Activity was necessary to her, but labour was painful; she longed for relaxation as for a thing unknown; never had she tasted it, never had she been able to breathe freely, or be mistress of her mind and of her time.

To reflect in order to improve her own mind, to seek the truth for herself, to enjoy family affection without thinking of the world or its fame, such was the fate that smiled upon her, and which perhaps did not satisfy her, for, if she had sometimes found her life too laborious, she had never found it too much occupied.

But the aspect of affairs seen close at hand, too much occupies even those who play no part in them, to leave them any feeling of idleness. Placed in a perfectly new position, Madame Guizot did not escape so powerful an influence. Released from a thousand vexations, from a thousand real cares which harassed her mind, and absorbed her time, she was able to observe and to think more freely; and greater objects offered themselves to her notice. It too often happens that public life lessens the soaring of the mind, impairs the purity of opinion; but we may doubt, nevertheless, whether he who has always lived remote from it could well understand, even in an abstract and general sense, the true nature of man and of society, and penetrate the whole mystery of their destiny on earth. True policy modifies the freedom of speculation in the concern of truth, without shaking the solidity of its principles for an exalted mind. Well advised, it at once attests and limits the empire of reason over the things of this world; it teaches on what conditions that slow and sure victory of good over evil is to be fulfilled, which the moderns call perfectibility.

During about six years that this first essay in the history of affairs lasted, politics were to Madame Guizot the object of an engrossment justified by her devotedness to the interests of her husband, and to those of every just cause. Free for the first time to work at her pleasure, and to choose her own subject, she wrote an essay upon "*The Ideas of Right and Duty considered as the Basis of Society*," which will undoubtedly be found to throw great light upon a difficult question, which passion and prejudice have designedly obscured.

It is much in the same style as an essay upon *Anarchy and Power*, which, although written at a much later date, connects itself naturally with the former, which it completes and elucidates. One cannot fail of being

struck with these two compositions, and with the vigour of mind of which they give proof. The first, full of original and fertile views, is perhaps sometimes a little more ingenious than it need be; but the second is distinguished by a perspicuity, a justness of expression and of thought, which enforces conviction. Both belong in the main point to ideas sufficiently modern, at least in their application to politics. They show that Madame Guizot experienced the necessity hitherto more felt than satisfied of supporting them upon the same principles as morals. But she did not always guard herself from a kind of puritanism, otherwise sufficiently justified by the looseness of principle which the civilians, monarchical or democratical, have by turns brought into these subjects. What she especially prohibits herself is complacency for her own opinions; we feel that she is distrustful of what flatters her, and that she chooses not her opinions for a purpose, but for themselves. Besides, good is never in opposition to good, and liberty has nothing to lose by truth.

Politics form one of the best schools for the mind. They force it to search for the reason of everything, and at the same time do not permit it to search except in facts. It is not necessarily the most difficult study, but it is that which, well conducted, gives the greatest firmness and prudence to the mind; and even he who only occupies himself seriously in politics, when he turns his attention to other subjects, cannot fail of showing both originality and superiority. Madame Guizot is herself an instance of the truth of this.

About the middle of 1820, her husband retired from affairs in which his opinions no longer found place. This change of position affected them but little: it was lost in the more important consideration of the blow which struck at the cause to which they had devoted all the energies of their minds. It made them again enter into that laborious state, from which Madame Guizot had appeared so happy to be released; but she made this sacrifice with such ease and simplicity, that her most intimate friends were unable to perceive that it cost her any effort.

Literary labour now again became to her an honourable necessity, and what had formerly enabled her to assist her mother, now afforded her the means of educating her son. In 1821, she published *The Student*, a novel on education, in every page of which, proof is given of the elevation of her mind, and the strictness of her judgment, amidst the fictions of a lively, natural, and diversified tale. This style presents many difficulties. It is now pretty well agreed that the beauty of a work of imagination is independent of its moral design; and literary criticism insists not upon such in its composition: but, when a moral design is the very motive of the book, the mind is left free, and the imagination has less scope. Nothing then is more difficult than the composition of a story which unites interest, variety, and truth, with the purity and clearness of the moral idea, which should be always present and always apparent; nothing must be separated from it, everything must lead back to it, without, at the same time, the narrative ceasing to delight our imagination, and to excite our curiosity and our sympathy.

Madame Guizot, who has constantly succeeded in resolving this difficulty in the composition of her stories, is far from having failed in *The Student*. It is however the moral sentiment, rather than the romantic part, which appears to us the great merit of this excellent book. Two general ideas have inspired it, and we may observe that the recital is double. The history of Ralph is intended to establish the inviolable duties which result from our natural positions, and the legitimacy of the dependence in which children are placed with respect to their parents, or to those who represent them. The history of Victor is the development of an idea which will be found set forth in the *Essays upon Education*. It tends to show how an ingenious mind can redeem itself from a first fault, and,

by well sustained efforts, arrive at discovering in the sense of his fall, a principle of regeneration; a true and great lesson, and which accords with the opinion which Madame Guizot made the rule of her conduct, and the foundation of her works on education; that there is no moral evil past recovery, and that human nature, even under the weight of a serious error, ought to recover itself, and is always enabled to do so by divine assistance.

An episode of this same novel, the history of *Marie*, seems to take up the same principle, as does also *Nadir*, a delightful story, which forms a part of the collection which she published two years afterwards, and in which, perhaps, better than in any other work, she has lent to her lessons of morality the aid and the attraction of a simple and agreeable fiction.

These various publications, however, were only, as it were, fragments. The same spirit pervades them all, and in each of them the ideas of the author seemed to be bound up, and people looked forward in expectation of a work from Madame Guizot, which should combine and corroborate them as a whole. Such a book soon appeared, which gave the theory of education that for a long time each of her writings seemed to promise, and placed her in the first rank of moralists. *The Family Letters on Domestic Education* are the best monument of Madame Guizot's mind. In this work, under an easy form, which in appearance has nothing systematical, which freely admits of examples, details, and digressions, she treats the greatest questions of moral philosophy, and shows by applications how general truths ought to regulate real life, and penetrate into the young reason of children. The excellence of the book consists in the union of great strictness of principle with perfect liberty of mind; it is by this that it presents a faithful image of her who composed it. Nothing is there conceded to expediency, nothing to arbitrary conventions; nor is there anything in it that has the stamp of that sentimental indulgence, which in our days too often passes from novels into morals. It is a book consisting entirely of truth. But, if the principles are those of a philosopher, who but a woman would have been able to discover those particular views, so fine and so varied; those nice observations, dictated by so true a knowledge of children, and of the world; those strokes of feeling which betray and excite emotion? Who but a woman, who but a mother, would have been able to express reason with so much tenderness, and have softened it without impairing its force? I have said that the principles were those of a philosopher. The moral of the book is indeed pure, elevated, and strict; it is supported neither by the interest it excites, nor by dogmatism; it relies only on itself, and claims not to hold its power, but by its justice; this is to say, it is philosophical. Let us repeat this word in order that it may be understood. Morality is philosophical when it is rational, when it does not lay claim to any authority foreign to its nature: this supposes it to be neither a convention nor an emotion, and that it is another thing than religion.

But in order to be philosophical it does not follow that it may not be religious. Even as it touches the heart that it binds itself to order without raising either feeling or interest, it can form an alliance with religion without being dependent on it: to say the truth, it is rather distinguished than separated from it, and both can by common consent reign in the mind, and govern the conduct. Of this, Madame Guizot's book affords more than one proof; but she is herself a still more remarkable example of it.

At this period Madame Guizot was disturbed by subtle uneasinesses, which yet attest a mind endowed with faculties superior to her opinions. But these gradually declined, and a profound peace was established in that mind which had been more easily disturbed than she was willing to believe. Such is the empire of reason and of happiness.

Madame Guizot in a fixed position, governed by an affection which united the ardour of love to the calmness of duty, was led back by study and reflection, by serious and tender advice, to those pure and firm principles which alone can appease the torments of the mind, and which formed in her the indissoluble alliance of feelings and opinions, of the wants of the heart and the requirements of reason; and without ever returning to the practical belief of the French established church, she raised for herself a faith no less lively and no less strict, which did not less touch her heart or govern her conscience, than the most powerful doctrines of sacred tradition.

Such was the piety of Madame Guizot, and such was the state of mind in which sickness and death overtook her. Her last work had been rapidly composed amid the sufferings of a visibly declining state of health. On finishing it, she appeared to have reached the limits of her strength. It is seldom that superior endowments are met with in a woman, without her being oppressed by the load: the most distinguished woman still remains a feeble being; and Madame Guizot was strong only in character and mind. However peaceable was her life, she enlivened it with the fire of her genius, and expended it in the midst of happiness and repose. Afflicted with a deep and slow disease, she daily became weaker, but not desponding. For nearly a year she struggled against the malady, which she strove to banish or to overcome; then, as ever, she placed her duty and her hopes in opposition, but at length she acknowledged the vanity of her efforts, and perceived that her decree had gone forth; she submitted to it without a murmur, and from that moment her resignation was complete. Surrounded by the most tender and devoted cares, affected and gratified by the love of which she was most assured, equally supported by reason and by faith, she gave herself up to the contemplation of her death. In the intervals of her pains she continued to converse upon the truths which had enlightened and guided her life.

On the 30th July, 1827, she bid a tender and tranquil farewell to her husband, her son, and her family; she told them that she felt her end was approaching. On the 10th August, at ten in the morning, she requested her husband to read to her. He read a letter of Fénelon's, for a sick person; he then commenced a sermon of Bossuet's, on the immortality of the soul; and in the midst of the sermon she expired. Thus was verified a prediction, or a hope, of which she had delighted to converse. Almost always harassed with cares and labours, she neglected none, and gave herself up to them with ever increasing devotedness, as if an inexhaustible reserve of happiness and peace had been insured to her. "It is," she says, "on the necessity of an immutable futurity that I travel on incessantly, and that I shall end by passing from one world to the other. But I expect a light and a clearness in my latter days, that will render this passage easy and certain." (Letter written in 1822.)

There remains little more to add; I do not think I have forgotten any of the traces of that image, which time can never efface from the remembrance of Madame Guizot's friends; but in writing, it is necessary to consider everything separately, and to make a person known, to analyze the whole that constitutes individuality in its full grace and freedom. In successively retracing the qualities and opinions of Madame Guizot, by incessantly comparing her destiny with her nature, we seem to be exhibiting a system; but we cannot reproduce the action and the harmony of the whole person, we cannot restore that unity of nature, which, in her, reconciled so many varieties, and almost contrasts. Thus, nothing was lost, nothing was indifferent, in that noble life; in it everything had an aim, a value, a rule; at the same time, good principles had taken such possession of her mind, that she obeyed them without effort, and in the fulfilment of her duties she

appeared to be following her own inclinations. Reason had not given her either coldness or constraint. Strong in suffering, she was tender and almost weak in happiness; she relished the real enjoyments of life, the most simple pleasures afforded her a childish delight. Almost always deprived of ease and leisure, chained to study, confined in towns, she could not breathe the country air without a kind of intoxication. The enjoyment of the arts, and those of nature, excited in her a real emotion. No one has better proved the truth of those words, I believe, of Rousseau's: "Strict morals preserve the tender affections."

The idea of duty was ever present to her mind; she applied it with rigour to the solution of moral inquiries; injustice inspired her with indignation, immorality with a disgust which she knew not how to restrain; to cause grief to any one was to her almost an impossibility; to witness even merited pain only excited her pity; and her kindness disarmed her justice. But it was especially the sufferings of strong minds that excited her deepest compassion; in their sorrows she recognised her own, and suffered with them.

There is so much mind in the works of Madame Guizot, that it seems superfluous to speak of what she showed in conversation. Her's was strikingly original; and she sometimes astonished to such a degree, that it was necessary to be accustomed to it to find it pleasing. But with a little experience, it was soon discovered that although her language was different from that of most people, she was quick in comprehending every one, and arrived by sure, though, perhaps, circuitous means, at the knowledge of all that was true, at sympathy for all that was good. With her everything proceeded from herself; she repeated nothing, she borrowed nothing, even from reading; no book pleased her that did not make her think; she required a new effort to make her own of even common ideas; she never yielded to an opinion until after she had herself discovered its motives, or adopted it, unless stamped with her seal. The reasons which determined her mind were not always the most natural, but they were *her own*, like those of Montaigne. She did not always take the most simple method of arriving at the truth, but she would at length attain it, and her mind knew no rest until she did. Then all opposition was at an end; there was no struggle in her, no discord, she yielded to it implicitly; her judgment governed her will, truth reigned in her by right divine.

This excellence is rare; it is, perhaps, the highest ambition of the philosopher. This immutable harmony of the mind and the heart must in every case be loved and admired, but can it ever be more worthy of admiration and of love, than when it unites the wisdom of a sage to the heart of a woman?

THE GLASS MANUFACTURE.¹

THE manufacture of the inferior window glass, called *broad glass*, needs no description, for it differs little from the process just described; the materials used are of course more rough than those employed in the making of crown glass; one of the ingredients is the waste alkaline substance left by the soap manufacturer; the others being kelp and sand. When these are all melted and reduced to a paste, the metal is *blown*, and then expanded by a whirling motion like that just described. The coarse material called *green bottle glass* will not require more than a few words, the processes pursued in its manufacture being nearly the same with those already particularised. The reader will suppose that the coarsest and cheapest elements suffice for the production of a substance which appears no more connected with plate or flint glass, than the diamond with a common pebble. Sea-sand and lime are frequently

the only ingredients used; the lime acting as a *flux*, and the salt supplying alkali. From these simple and cheap elements a large amount of glass is yearly made in England, especially in Newcastle and its neighbourhood. We must here remark, that the operations above described are only the more general and essential processes connected with this manufacture; it being impossible to enter, in such an article, into the numerous details of the art. No branch of British manufacture abounds with more varieties of working than this; every glasshouse having some peculiarity arising from the greater or less degree of skill or experience possessed by the head, the kind of mart it supplies, and the quality of the sand or alkali used.

All these points affect the nature of the processes employed, and render it difficult, if not impossible, as it would certainly be uninteresting, to detail such minute technicalities. The applications of glass to the useful purposes of life must not be forgotten when we have traced the steps by which a wild sea beach, and burnt plants, are reduced into this material. If all these labours, and skilful adaptations of chemical science, only result in the creation of an ornament, or but swell the sum of our luxuries, we might regret to see so vast an outlay for such returns. Some might, even in such circumstances, think that whatever sheds an additional grace over the rudeness of life, or imparts more delicate preceptions of the beautiful to quicken the dulness of men, has not been made in vain; but the multitude, all who have taken but the common degree in the school of life, will give little heed to such artistic abstractions. Use must be evident in a manufacture to win the admiration of these men, and mere beauty will long plead in vain for admission to their museum. The glass manufacture is therefore fortunate in providing matter for the delight of the luxurious few, and the advantage of the busy crowds of populous cities.

Scarcely a cottage in Britain is without some testimony to the varied comforts and even blessings procured by glass. How different is the appearance presented by a house with unglazed apertures in the walls, when contrasted with another possessing the neat window-frame. In the former the tenant is unable to admit the light without receiving the chill blasts which sweep down the glen when 'the wintry storm is rising; but the inhabitant of the other is furnished with a transparent shield which repels the arrowy sleet, whilst it admits the faintest light of early dawn. How much of comfort in a thousand little details, do the glass windows of the poor man's cottage furnish to one family! What then must be the total amount of physical good, produced all over England by such house appendages! Few manufactures, therefore, appeal more directly, in northern climates, to our perceptions of the useful than those relating to glass. The gain to human health, and therefore to human happiness, arising from the use of this substance, is far beyond the calculation of any actuary, and probably entered little into the thoughts of the man or men who first discovered glass.

For many ages its production was too limited to allow of such *extravagancies* as the filling in of several square yards of a poor man's house with such crystalline plates, and even the lord of half a county might feel himself peculiarly privileged in possessing windows to his mansion. A walk through some of the English towns in the days of Alfred, would have introduced us to a very different spectacle from that which now meets our view, as we drive down the main street of a flourishing city. Some of those shop windows exhibit *walls* of plate glass which an estate would not have purchased in former times, and upon which our Edwards and Henrys, in the height of their magnificence, never gazed. Glass windows were not used in English private houses till the time of William I., nor generally adopted till ages after: this addition to the dwellings of men must therefore be ranked with the improvements made in the later years of the world's old age. The beauties of the heroic

(1) Concluded from page 172.

drama, and the spiritual grandeur of Grecian sculpture, shed a halo of magnificence round the remote ages when Socrates uttered the music of a sublime morality, and Sophocles drew tears from the old men of Athens; but the simple pleasures of a modern house were unknown to the children of the men who conquered at Marathon. Pericles, in the height of his deserved glory, could not enjoy the light in a stormy day, without exposing himself to the blast: a condition which the lowest of our fellow-creatures would now deem the mark of utter desolation. The poor peasant of our times thus possesses a source of pleasure unknown to the heroes of olden days, and may console himself with the reflection that the treasures of art are made available for him, and present in varied forms their offerings at his cottage door.

The secret experiments of our greatest chemists combine to create, for the humblest, a purer medium through which the light of day shall reach their apartments. Some may deem these advantages of too purely physical a nature to merit high praise, and regard them at best but the ministers of the senses. But let such remember, that civilisation in *all* its forms influences the mind, and thus reaches objects of the loftiest nature, opening the understanding, and increasing the mental susceptibilities, whilst adding to material good. A small class of speculative idealists may be found, who, seeing the evils of luxury, and dreading the predominance of the sensuous, ridicule the word *comfort*, and deplore the great prevalence of physical science. Is not the universe formed from the material and the spiritual? and are not the souls of men strangely and powerfully acted upon by material things? To govern matter is, therefore, one step towards the government of mind, and to attain this end is the great object of the sciences. To become a victor in the world of matter, it is not necessary to be the slave of the senses; but such a paradox is implied by all the declarations against the progress of man in the modern sciences. Let us rest assured that perfect freedom of intellect, and all true development of the religious emotions, will be only achieved by the advance of the mind in *all* departments of knowledge. Nothing can be justly deemed of little avail, which tends to diminish one pang, or produce one pleasurable feeling; for such results leave the mind free from the irritations and entanglements of temporal ills, to dedicate its powers to high employments. Thus the various arts pursued by men,—the workings in iron, cotton, glass, and other useful branches of industry,—must be classed with the labours of the divine, the moralist, and the statesman, when we enumerate the causes and accompaniments of civilisation. The solemn cry of Goëtic, "light, more light!" has been in all ages the prayer of earth's noblest sons, and some addition to this desired knowledge is made by the most humble advance in useful arts. Thus increased happiness, and the progress of man in power, are promoted to a considerable extent by the glass manufacture; and a truly thoughtful man will, therefore, estimate its value by no mean standard.

But there are results connected with the adaptations of glass to scientific purposes, which must suggest a still higher notion of its importance. In the commencement of this paper, we gave the materials recommended by Faraday, for the manufacture of glass for optical purposes; and who is not impressed by the grandeur of the discoveries resulting from the telescope, when directed to the hidden spaces above; and from the microscope, when applied to the investigation of the minute world! But such instruments are dependent, in a great measure, on the production of a pure glass; and this fact must give an additional interest to the manufacture. This conclusion will not be weakened by remembering that other substances are also used for those instruments, as the diamond and sapphire for the microscope, and metallic plates in re-

flecting telescopes. Those who know the long series of experiments instituted by Dollond on the refrangibility of the different rays of light, and his discovery of the achromatic¹ telescope, will admit the importance of this manufacture. Even to the present day we are unable to produce flint glass capable of transmitting uncoloured rays to the eye, though large rewards have been offered for the discovery of such a material. If we now turn from science to art, we may observe magnificent effects resulting from the use of glass in Gothic architecture, in which gorgeous windows diffuse across the solemn naves of cathedrals, and the tombs of kings, the soft coloured light. Whoever walks up the naves of King's College chapel, Cambridge, must feel how much of its grandeur that noble monument of the fifteenth century owes to the twenty-five² windows of richly stained glass, each of which speaks by its wonderful illuminated portraiture, to the imagination of all beholders. The mysteries of paradise, and the marvels of sacred history, seem revealed to our astonished vision; whilst, rapt in admiration, we survey the forms of patriarchs, prophets, and angels, traced in vivid colours on the numerous compartments. Over Europe, and throughout England, we find many similar instances of the aid rendered to religious teaching by glass, when united to painting; and this substance is, therefore, not only applicable to the purposes of common life, and the investigations of the scientific, but to the ends of Christian art. Painting on glass was early cultivated in the wealthy Hanseatic city of Cologne, where, about the year 1260, many artists devoted themselves to the fascinating work. The adaptation of such painted glass to religious objects, and its harmony with the spirit of the pointed style in architecture, were soon perceived; the abbots and monasteries of Europe were speedily enriched by these wonderful productions, and for two hundred years, the church drew on the resources of the artist, for imparting additional richness and sublimity to her sacred buildings; probably, much of the stained glass of Cologne was brought to England, as the closest intercourse existed for ages between the merchants of this country, and those of that Rhenish city. The painted windows of its unfinished cathedral still bear silent witness to the ancient glory of Cologne, and to the patient labours of its former artists.

We may here remark that painted glass is peculiarly fitted to produce rich effects, in consequence of the light *passing through*, instead of resting on, the figures, which thus possess the soft beauty of transparency. The "dim religious light" produced by the rays passing through a coloured medium, harmonizes with the multiplied tracery, and rich foliated forms of the stone roofs and columns, softening down all harsh contrasts, and thus filling the building with that calm, so much in unison with solemn services.

We have now surveyed the glass manufacture from its remote beginnings in the cities of ancient times, and have noted the progress of the material from its native sand and ashes, until it assumes the forms required by the elegance and science of modern life, whilst its adaptations to the high purposes of religion have given us an additional interest in its production. In closing this article, we may express our satisfaction, that the numerous advances in chemistry, that vast science of nature, have enabled the manufacturer to produce a purer glass at less than one-half the cost required a few years ago. This result is especially gratifying, when we observe that a vast increase has taken place in the sale of the best glass; so that in some districts the consumption has increased eight-fold. This, however, is not wholly caused by improved process, but partly by a judicious

(1) This word signifies *without colour*, and is applied to telescopes in which the images are free from the coloured edges so often observed in inferior instruments.

(2) There are twenty-six in all; but from some negligence the great western window was left plain.

reduction of duty on the materials from which glass is formed, thereby increasing the facilities of the maker, and diminishing the temptations to smuggling, or the use of illicit glass-furnaces. These, the reader may be surprised to hear, were often in active operation, in cellars and other secret places; for though the production of a first-rate glass requires the nicest care, little knowledge is necessary for making the common material.

Here we must end our remarks on this subject, trusting the reader has derived that kind and degree of information from the perusal, which may add increased interest to surrounding objects, and enable him to estimate aright the labours of his fellow-men.

W. D.

A CHRONICLE OF ST. ALBANS.

THE works, under the personal inspection of Offa, progressed with astonishing rapidity, and, ere he was called to his rest, which happened about five years afterwards, he had the felicity of seeing all the buildings necessary to the monastery completed, and Willegod, with one hundred monks, in peaceful occupation of their new and stately home. The king closed his eyes on this mortal scene, in his royal palace of Offley, whence his remains were conveyed to Bedford, and there deposited in a small chapel on the banks of the Ouse. Chapel and tomb were in after years swept from off the face of the earth by the inundations of the river, but, while one lofty arch of the noble Abbey of St. Alban's still remains, Offa, "of immortal memory," will need no other monument! The good Willegod did not long survive his friend and patron, for, stung to the quick by the ingratitude of the young king, who refused the monastery the usual honour of the founder's bones reposing within its walls, he pined and languished, and, ere two months had passed away, he had rejoined him in the land of spirits. The first Abbot of St. Albans died of a broken heart! He lived, however, long enough to have "set his house in order," to have brought his goodly household to conform with regularity and decorum to the stern rule of St. Benedict, and to have seen peace and prosperity upon his Israel. The vows imposed upon Benedictine Monks were those of poverty, chastity, and unquestioning obedience to their spiritual ruler, and in the very early ages of the Church they appear to have been, with but few exceptions, religiously observed. But at St. Alban's Abbey—sad to tell—they were speedily broken, and that by the guardian of the flock. The Abbot, third in succession from Willegod, died in a drunken fit, after having (as Matthew Paris indignantly expresses it) "satiated himself with the fat of the public wealth, and excited not only the vengeance of God, but the hatred and curse of the whole convent."

His successor, Vulnoth, appears to have been a "mighty hunter before the Lord,"—a character hardly less suited to the cowed Benedictine than that of the "gluttonous man and the wine-bibber:" so true is it that "all hoods make not monks." Being seized, however, with a palsy, he believed that the avenging hand of God was laid upon him in wrathful indignation; and, causing his dog-kennels to be demolished, his numerous hawks set free, and his hunter's dress to be consigned to the flames, he became henceforth a man of "admired sanctity." In his time, England was disquieted by the inroads of the Danes, who, hearing of the glories of "St. Alban's cell," in 980 paid it a most unwelcome visit, and, meeting with but little resistance from Vulnoth, and his "soldiers of the cross," broke open the martyr's tomb and carried his bones away in triumph to their own far distant land. When, or by whom, the much-prized relics were restored to their rightful possessors is not certainly known, but it is probable their restoration formed an article in one of the many treaties entered into by the degenerate descendants of the warlike Saxons with their fierce invaders. Doubtless it

needed small persuasion to induce the godless northmen to barter the relics of the Saint for the broad pieces of the wealthy churchmen.

The penitent Vulnoth flourished in the reign of Athelstan; in that of Edmund the Good, St. Alban's Abbey was ruled by Xedred, its fifth Abbot, of whom the chronicler has little to relate, save that "he was respectable for the elegance and deportment of his person!" Ulsinus, his successor, was a very different character,—pious as a private Christian; beloved and respected as a spiritual ruler; honoured and obeyed as a temporal one, he did good service both to church and crown, and may, moreover, almost be regarded as the founder of the town of St. Albans.

Offa, when he had completed the monastery, placed this inscription over the martyr's shrine,—“Here lieth interred the body of St. Alban, a citizen of old Verulam, of whom *this town* took denomination, and from the ruins of which city this town did arise. He was the first martyr of England, and suffered his martyrdom the 17th day of June, in the year of man's redemption 293.” Now from this we should naturally suppose that the town was contemporary with the foundation of the monastery, but the worthy king's "wish was father to the thought," for, with the exception of a few straggling cottages, no buildings surrounded the Abbey until the reign of Edred, 948, when Ulsinus, its energetic Abbot, built houses and encouraged others to do so; upon which, in a short time, a "town did arise," with mushroom growth, under his able and vigilant direction. His dust has probably long since been cast to the winds of heaven, and at the hands of the Puritans his bones received all conceivable insult and indignity.

But what matters? His works (or at least their foundations) still remain; and the sister churches of St. Peter's, St. Michael's, and St. Stephen's, the Lady Chapel, and the market-place, bear testimony to his regard for the weal, both spiritual and temporal, of those committed to his care; they prove, too, the injustice of the charge laid against ALL monks, in ALL times, of having lived but to, and for, themselves alone. That many did so is not to be denied, but that *all* did so, is as untrue as every broad and sweeping assertion is, upon examination, almost without exception found to be. Neither were they all ignorant, as many would fain have us believe; and for the instance of a learned monk, we have but to turn to the annals of St. Alban's, and read there the name of the successor of Ulsinus. Alfrie was, in very truth, a man of letters and of learning; and works are still extant, in Exeter cathedral, and elsewhere, penned by his hand. Nor are their contents unworthy of attention.

From the death of Elfrie, the 7th abbot, which took place, A.D. 950, for the space of half a century or more England enjoyed the blessing of peace, and the abbey, sharing in the general prosperity consequent thereon, flourished, and increased in riches. The two abbots, who successively bore rule during that time, being pious and peace-loving men, employed themselves in searching the ruins of Verulam for precious relics of antiquity, and in superintending the preparation of materials of which they intended to build a more beautiful church than the one then attached to their monastery. But heaven's will was not as their will, and, ere the preparations were completed, Ealdred and Eaduser both slept with their fathers. In the reign of Ethelred, our country was visited by one of the heaviest judgments of the Lord, and "famine was sore in the land." Happily for St. Alban's there was a refuge for the famishing more hospitable than the workhouse, and those at its portals were ready to distribute with more liberal hand, than are now the guardians of the poor! The gates of the monastery were thrown open, and Abbot Leofric and his monks were ever ready to welcome the hundreds who flocked to receive their blessing and their alms. Fancy can scarce picture a

scene more heart-stirring than that which each day was enacted at the noble entrance to St. Alban's Abbey. The lordly abbot, in his priestly robes, his train of cowed and shaven brethren, the multitude before them, now pressing forward to receive their share of the "staff of life," so freely given, "without money and without price," now bursting forth into cries of thankfulness, and now falling on their knees to receive the father's blessing, or to crave his prayers, with the dark background of the noble western porch, form together a picture at once deeply interesting and moving! Day after day, and week after week, the gates of the monastery were still thronged by countless numbers of the "poor destitute," and still the faithful Leofric was at his station each time the great bell sounded; but the dole was not so plentiful, and on his brow were marks of care. Truly the good man "suffered with those he did see suffer;" and his heart bled, as he viewed the famishing multitude, and remembered that his coffers were well-nigh empty. "Meagre were their looks, sharp misery had worn them to the bone;" and he had not wherewith to satisfy their piteous cries for bread. In this extremity he "bethought him what he would do," he sold all the precious stores amassed by his predecessors for the erection and embellishment of a new and costly church, and gave the proceeds to the poor. When charged with sacrilegious waste of "many goods laid up" for the Lord's service, he gave an answer worthy the most enlightened Christian of our own day. The "faithful in Christ," he said, "especially if they were poor, constituted the church and temple of God; and were, indeed, that real and true church which it was his duty to build up and preserve, and that it was the best instance of pure and undefiled religion, to visit the fatherless and the widows in their affliction." But bitter to himself were the fruits of his noble conduct, for all the brethren could not, like him, forget the *monk* in the *Christian*, nor the duties of the one in the more important ones of the other; and the dissensions in the monastery rose to a fearful height, almost amounting to absolute insurrection. However, "the night is long that finds no morrow;" and his troubles found their end.

The famine was stayed, and the fruits of the earth in their season were restored for the use of man, whilst the noble-minded Leofric, being promoted to the dignity of the Archbishopric of See of Canterbury, found, that, though often "lang o' comin'," "duty never yet did want his meed."

Hard by the monastery, in "olden time," stood the Palace of Kingsbury, and there the Saxon monarchs often held their courts. But the near proximity of Royalty, with all its train of overbearing courtiers and idle servitors, was found to be prejudicial to the morals and well-being of the monks, and in the year of our Lord, 1006, Alfrie, the then Abbot, bought it of the crown, and, demolishing the buildings, made the grounds Church property.

King Canute, however, unwilling that every trace of the habitation of his fathers should be swept away, commanded that one tower should be left standing; and standing it is to this our day. When wars were raging, and rumours of wars were rife in England, it served as a conspicuous height on which to raise a telegraph, and, now that peace reigns throughout its length and breadth, it is converted into a clock-house, and from its venerable appearance, and interesting associations, well merits regard as a time-honoured relic of the past! From the reign of Canute to that of Harold, no events of any historical interest took place in which St. Albans bore a part. Its riches and prosperity were daily increasing, and the abbots who in turn bore the pastoral staff, being peace-makers rather than destroyers, under their mild sway both "town and gown" pursued the even tenor of their way, undisturbed by the petty feuds which constantly embroiled their neighbours. But troublous times were at

hand, and, in the year 1066, war's shrill trumpet sounded far and wide through the favoured land of the Angles, called all good men and true to leave the kindly shelter of their "ain fire-side," and to fly to arms in defence of their altars and their homes.

Deeply tolled the alarm bell from the massive tower of St. Alban's Abbey, and troops of the hardy peasantry were seen hastening to those gates, at which the hoary-headed grandsire among them could still remember having been led a youngster by his mother's hand to receive the bread which was to save him from starvation. The bell has ceased its solemn call—and blessings, "deep not loud," rose from the multitude assembled without the monastery, as the porter threw open the old oak gates, and the venerable Abbot Frithric came forward with hands and eyes upraised to Heaven, thence to invoke a blessing on their heads, ere he proceeded to make known the objects of the meeting. Then he lifted up his voice so as to be heard of all, and told how that he had heard that William the Norman had crossed the channel, and was even then preparing to give battle to their rightful Sovereign, in order to seize the "pleasant land," won by their fathers' sword, and now to be defended by their own. He bade them draw it, ere it was too late, entreated them, forgetting all past animosities, to join heart and hand in upraising the banners of their Thanes, and fighting beneath its colours for their King and their country, and their homes. Then he dismissed them with a father's blessing, and an oft repeated promise that his "prayers for ever and for ever should be theirs."

The good old abbot and his monks kept this promise to the utmost—day and night were their knees bent in supplication, and hour after hour through the vaulted roof of their church, resounded the deep-toned voices of the brethren uprising in solemn chant. But the time for prayer was over—that for action came! news were brought, ("and every true heart wept for't,") that on the bloody field of Hastings, with thousands of England's best and bravest sons, lay "Harold the Unhappy," whilst Duke William was in full march upon the capital.

Frithric, in whom the wisdom of the serpent, the gentleness of the dove, and the boldness of the lion, seem to have been blended, rose superior to the cowardly fear of those around him which spoke of submission to the stranger; and, knowing that the Norman and his followers, if unchecked, would pass through St. Albans, he determined to intercept his progress, and be the first this side of Hastings to show resistance to the Conqueror. Causing all the timber on the Church lands to be felled, he so effectually barricaded the road, as to oblige William, chafing at the delay, and still more at the insult, to make a circuit of some miles to Berkleystead, which was then the place of his destination, and afterwards became his favourite residence. Thither, under promise of safe conduct, the Abbot of St. Albans went, and the proud Norman demanded, in haughty tone, how he had dared to intercept his march. Frithric's reply was mildly yet firmly given.

"I have done what I ought," said he, "and if all the spiritual persons throughout this land had used their endeavours to have hindered thee, as they might and should have done, it had not been in thy power to have come thus far."

"Is the spirituality of England then of such power?" exclaimed William. "Well, if I live to enjoy what I have got, I will rule their greatness well enough, and make their power less, and I resolve to begin with thee."

To this taunting threat the churchman made no reply—his was the courage which loves to show itself in action, not in word; and, leaving the haughty stranger to enjoy the pleasures of the chase, he retired to his monastery; there to form plans for securing freedom to his country, and its throne to the rightful heir. Young Edgar (or Englemond's Direling, as the Saxons loved to call him) fearing to trust himself within reach

of his ambitious foe, had fled to Hungary, and there he dwelt in exile, whilst his faithful subjects, Alfred of York, and Frithric of St. Alban's, raised his standard, the one in the north and the other in the south, and gathered around it hundreds of the true-hearted and the brave, lovers of their country and their king. Hearing of the success attending their patriotic efforts, the Atheling, England's last hope, returned to his native land. But his was a gentle, not a warlike nature; ambition bore no rule within his breast, and foreseeing that the crown of his forefathers, if secured to him, must ever prove one beset with thorns, and being "weary with disaster, tugged with fortune," he not long after voluntarily relinquished the "golden sorrow" into his rival's abler hands. Meanwhile, William, startled, if not actually alarmed at the formidable appearance made by the malcontents, invited them to a personal conference at Berkhamstead. Thither the abbot of St. Alban's, with a goodly company of nobles and prelates, repaired, and in their presence the duke swore upon the relics of Britain's protomartyr, an oath administered by Frithric, that he "would keep and observe inviolable all the ancient laws of the realm, which his pious predecessors, and especially the holy Edward, had established." But, alas! the sweet singer of Israel knew only too well "what is in man," and how faithless is the son of man, when he said, "put not your trust in princes." Hardly had the relics been removed from the presence of the duke, and restored to their wonted shrine, than he forgot the oath sworn, with his hand laid solemnly upon them,—broke the laws of the confessor he had promised to fulfil, and treated his new subjects as though they were but the "beasts of the field." Seeing that neither faith nor mercy was to be expected from the lawless invader, Edgar Atheling took refuge with Scotland's king, whilst his firm friend and stout defender, the venerable Frithric, called his monks around him, in the chapter-house of St. Alban's Abbey, and telling them that all hope of redress was past, bidding each one see to his own safety, he bid them a tearful and affectionate farewell. Heart-rending was the parting between the abbot and his monks; but "all that a man hath will he give for his life," and, expecting each hour the foe at their gates, they hastened to quit for ever their loved and noble home. . .

The shades of evening had closed around the Isle of Ely, when an aged man, bowed to the earth with the "vile blows and buffets of the world," claimed admission to the "camp of refuge." He was received with the tenderness and respect due to his sorrows and his years, by the many bishops there assembled; but he told them he needed no honours, but was "come to lay his bones among them," and craved "a little earth for charity."

The sun rose once and again, and found the old man on his knees, but ere it was yet "high upon the earth," the way-worn pilgrim was gathered to his fathers, and the passing bell told sadly of the weary spirit's flight. It tolled for the broken-hearted,—for Frithric,—the last Saxon Abbot of St. Alban's.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE ALBUM.

(HENRY J. JOHNS.)

WHEN wandering through some region fair,—
A sunny land, by Nature's care,
In all her varied glories drest,
With all her rarest treasure blest;—
Should chance disclose—retired and lone,
And long with moss and weeds o'ergrown—

Some mouldering relic of the past,
That tells where man his lot had cast,
But, silent now, and desolate,
Reveals no record of his fate;—
Sudden that deep and quiet mood,
The blessed charm of solitude,
Dissolves, as if by magic spell,
While new-born thoughts and feelings tell
How deep within the bosom lie
The springs of human sympathy!
Then wakes the fond desire to trace
Who once had made his dwelling-place
Where now, in melancholy state,
Pale ruin only finds a seat!
Perchance some legend may disclose
A darken'd tale of mortal woes,—
Of one, to adverse fate consigned,
Yet rich in gifts and grace of mind,
Who here awhile in peace reposed,
And here "Life's fitful fever" closed!
Henceforth a mystic influence, wrought
Of sad yet sweetly-soothing thought,
Hallows, in Memory's fond regard,
The lingering relic Time hath spared!
Even such the gentle spell that o'er
The ALBUM breathes its secret power,—
Embalming every relic rare,
And fond memorial, treasured there!
Trace we, upon its varied page,
The brightly lay, the maxims sage,—
Strains of impassioned eloquence,
Or truths of holier influence,—
Or, drest in Nature's loveliest guise,
The pencil's magic mimicries;—
O'er each, some hand, or praised, or loved,
Or by affection's impulse moved,
Hath shed a charm, to gentle hearts endeared,
By memory cherished, and by love revered!

FAR, FAR AWAY!

RACHEL L.

I CANNOT link my spirit to realities so rife
With sorrow and with heartlessness, and mammon-seeking strife;
No, even while I sit with you in Town the livelong day,
My mind is revelling and glad, far, far away!

Where the heather-bells are dewy, and the tender grass is bright,
Where the fostering sun pours down on them a flood of golden light,

Where the precious dew is lying on each blossom-laden spray,
There am I revelling and glad, far, far away!

The still lake is my mirror, and the richest of perfume
I gather from the yellow flowers of the nectar-scented broom;
The pearls are gathering thick and bright on the spiders' web
so fine,

The jewelled tissue that they make shall serve for robes of mine

I cannot link my spirit to realities so rife
Of sorrow and of heartlessness, and mammon-seeking strife;
Forgive me that my spirit roves from home the livelong day,
O I would tie it if I could, but 'tis far, far away!

VOL. IV.

A VISIT TO THE NEW HOUSES OF PARLIAMENT.¹

THE THRONE occupies the centre of the southern end of the House. It is elevated on steps covered with a rich carpet of a bright scarlet ground, powdered with roses and lions, alternately, of gold colour, and fringed with gold colouring. The canopy to the throne is divided into three compartments, the central one much loftier than the others, for Her Majesty; that on the right hand for the Prince of Wales; and that on the left for Prince Albert. The panelling and heraldic emblazonry of the back are indescribably beautiful; and so exquisitely is the brilliancy of the colours blended with the gilding, that the effect is that of perfect harmony; and, notwithstanding the extreme richness of the materials, there is nothing garish or gaudy, their glitter and glare being chastened by the most skilful combination, into an effect of surpassing delicacy and beauty. The central and side canopies are surmounted by Tudor crowns; and in the former are five niches filled with statuettes of St. George, and Knights of the Garter, the Bath, Thistle, and St. Patrick. Beneath each canopy are the arms of the royal occupant, superbly emblazoned, as well as within the arches of the canopy itself. On each side of the recess for Her Majesty's chair is a pedestal, surmounted by an angel bearing the royal arms. There are corresponding pedestals, with the lion and unicorn; and, stretching out on either side are dwarf wings traceried, and octagonal pedestals, on which are seated the royal supporters, the lion and unicorn holding standards, enamelled with the arms of England.

The Queen's chair of state, or throne, in general outline, resembles the ancient coronation chair; the legs rest upon four lions couchant, and have pinnaced buttresses on each side; the front, sides, and back, have quatrefoil panels, with crowns, roses, shamrocks, and thistles, and the royal monogram; and beneath the arms are lions passant. The back of the chair is gabled, and within it is an exquisitely quatrefoiled ornament of eight points, bearing the royal monogram. On the exterior ridge of the gable are boldly carved roses; upon a stem rising from its apex is a richly decorated crown; and upon the flanking buttresses are the lion and unicorn seated, holding scrolls. A broad border surrounds the square part of the back of the chair, on which are, alternately, large and brilliant egg-shaped pieces of rock-crystal, and lions within quatrefoils, enamelled. This gives a character of jewelled magnificence to the regal chair. Within this border are the royal arms of England, superbly embroidered on velvet.

The state chairs for the Prince of Wales and Prince Albert are alike in form and general details, the only variations being in the embroidery on the backs, and in the monograms. The backs are circular-headed, and the legs are curved, in the curve, or X shape, and the whole framework is richly floriated. The fittings are crimson velvet and gimp; the embroidery, the ostrich plume of the Prince of Wales, and the arms of Prince Albert, and their respective monograms.

To the Queen's Throne is a footstool, carved and gilt, and covered with crimson velvet, gorgeously embroidered in gold, with leaves, roses, fleurs-de-lis, &c. We should

add that there is a passage in the rear of the throne for the royal attendants; it not being etiquette to pass before the throne while her majesty is seated.

In harmony of design and exquisiteness of finish, nothing can exceed this new throne: it is architecturally correct, as well as picturesque; and, although from description, it would appear to be a blaze of enrichment, so artistical is the work that there is no appearance of superfluity or excess of ornament, or frittered appliances in any portion of the design. It is historical, national, and in every respect appropriate as the seat of sovereign power.

At present, only one window is filled with stained glass, the effigies of the sovereigns being drawn in the style of the period of the architecture: we believe it was proposed to substitute correct drawing, but this idea has been overruled. The other eleven windows are covered with a diapered calico: when they shall all be filled with stained glass, the effect will be brilliant and sparkling, and relieve the somewhat too golden hue of the ceiling and upper walls. The filling of the five remaining archways with frescoes will also aid the pictorial character.

We lingered for a considerable time in the superb chamber; for, some minutes had elapsed ere we could fix attention upon any especial portion of the decoration sufficiently to appreciate its design and genius, so to speak. Here is no unmeaning embellishment; everything contributes to nationality, aim, and purpose. You do not ask why this or that symbol or characteristic is adopted; it is part of a chain of illustration, or linked series; and there are no common-place repetitions; every piece of decoration assists to tell the story—to illustrate in this great chamber of its Legislature the artistic history of the country. It was long ere we had exhausted the decorative perfection of the house, and then, quitting it by one of the side doors, we crossed the corridor and entered

THE VICTORIA HALL.

This regal apartment has been taken from the long Victoria Gallery, as shown in the original plan. It is an after-thought of the architect, and a happy one; for, if we mistake not, it has found even a larger number of admirers than the house itself, or the peers' lobby. It has a chastened and subdued magnificence, in short, a delightful repose, which the house and lobby may be said to lack.

The walls are, to a considerable height, panelled with oak, having a deep frieze and elaborate erecting. On the north and south sides are three compartments, divided by columns, to be hereafter filled with frescoes. The east and west ends have each three windows above the panelling, filled with stained glass, figured with the rose, thistle, and shamrock, royal crowns, diaper-work, &c.; and the light streaming through them has an impressive effect. The lower oak panelling is of the napkin pattern; above are spaces to be filled with carvings representing important events in the lives of the Queens of England. There are larger panels over each of the two fire places, and in the western one an experimental bas-relief has been placed with admirable effect. Above these compartments is a range of tall panels, to be filled with portraits of the English sovereigns, painted upon a gold ground. The frieze above these panels is enriched with oak-leaves and acorns, and shields charged with the arms of the sovereigns of England, and labels bearing their names. The erecting above the frieze consists of Tudor flowers and quatrefoils with roses on pierced tracery. The small doorways leading into the corridors and the House of Lords are slightly recessed. On the north and south sides are larger doorways of lofty pitch, and very much decorated in the deep moulding. The southern door will lead to the Victoria Gallery: the opposite archway being a blank one, a statue of her majesty will be placed on a pedestal in front of it.

(1) Concluded from p. 164.

The ceiling of the Victoria Hall is divided by massive tie-beams into nine compartments, and these again into eight; the beams have bosses, all varied in character and richly gilt, carved with trellage, and the motto "Dieu et mon droit." The surface of the ceiling is dark blue; and upon it in heater-shaped shields are emblazoned the arms of England, Scotland, and Ireland, with quatrefoil borders, fleurs-de-lis, and coronals.

The two fire-places in this truly regal apartment are of elegant design and elaborate workmanship. The opening for the fire is a low arch, deeply recessed; the sides and back are encrusted with red and blue encaustic tiles, having on them the lions of England, and the Royal monogram, respectively. The grate is very low, and along the top bar are fleurs-de-lis. The reredos, or back, rises high in gable form, and has upon it the Royal Arms of England, with supporters and crest. The fire-dogs are of brass, the standards being of rich design and bearing shields with the lions of England, and surmounted by regal crowns.¹

The fire implements are of wrought brass; there is no fender, a raised stone moulding serving in its stead, and being in accordance with the architectural character of the apartment. The fender was an after-thought, for, at this date, (James I.) the chimney furniture, fire-shovel, tongs, &c. were "an invention," often of richly wrought silver, and given as wedding presents. The style of the period is admirably displayed in the characteristic enrichments boldly sculptured in stone above the arch, and presenting a very striking display of heraldic colouring and gilding. In the spandrils of the arch are Tudor roses, crowned, painted, and gilded; and from them flow gracefully the thistle and shamrock, also gilded. This regal character is likewise continued in the insignia of royalty sculptured in the long panel immediately above the arch. Within three large circles are as many quatrefoils, bearing shields of the arms of England, Scotland, and Ireland, with blue labels and gilt mottoes. In the spaces between the quatrefoils are circlets of oak-branches, with sceptres and swords placed saltire-wise, (cross-wise,) upon them, intertwined by a cord and tassels. Over the fire place is a plaster relief, coloured to imitate oak—the subject, Queen Philippa interceding with Edward III. in behalf of the citizens of Calais. This will be executed in oak, as will a corresponding relief for the opposite fire-place. The enriched effect of these fire-places, each flanked by doorways, the upper portions having carved bosses, and the plate-glass panels traceried heads, is extremely beautiful. The finger-plates, lock-escutcheons, hinges, &c. have all been designed in accordance with the architectural character of the room. Over each fire-place is a bracket bearing a clock, in a carved case; the dials enamelled in blue and gold, and colour.

The furniture of the Victoria Hall is also architectural; proving how desirable it is that the master-mind of the architect should direct the upholsterer's skill. Yet, if we mistake not, Mr. Barry has, in this country, broken ground in such an exercise of judgment. The chairs are of oak: they have straight backs, surmounted by lions' heads; the legs are formed like a curved X, with a carved cross-bar. The seats and backs are not stuffed, but consist of strained red Russia leather, stamped with Tudor roses, and secured by brass nails, of Gothic pattern. There are sixteen of these chairs, the cost of each being twenty guineas. They are very picturesque and unique in character. They are placed around two octagonal tables, of oak, resting on ogee arches, with winged lions and dragons couchant on the four ends of the plinth. The carpet corresponds with that of the House of Lords—deep blue, with gold

coloured roses. The room is lighted by gas, in coronal branches.

"It is impossible," says a contemporary, "to conceive a more regal apartment than is the Victoria Lobby, every detail being in such exquisite taste, and so gorgeously enriched by colour and gold. In addition to its splendour, there is the prevailing feeling that the embellishments are ALL ART, no hackneyed design or copied enrichment being introduced: all are new and beautiful. Indeed, we doubt whether King Louis of Bavaria, that art-loving monarch, ever imagined a more perfect specimen of art-decoration than this room will present, when all the architect's intentions are carried out. Even now, there is not a single decoration, or piece of furniture, which does not bear the stamp of genius and consummate taste; and when the pictorial beauties are added to its architectural, no room in Europe will exceed it in magnificence and appropriateness."

The system of *Warming and Ventilation* of the House of Lords and the Victoria Hall, cannot be made intelligible except by diagrams. We may, however, briefly state that beneath the Peers' Lobby and the House of Lords are air-tight chambers for hot or cold air; and in the roof are chambers for fresh or vitiated air. The fresh air is admitted direct from the river, and is purified by passing it through a finely perforated zinc screen over cold water; it then passes through caskets heated by one of Lord Dundonald's steam-boilers; this process being carried on beneath the Victoria Hall. The air being thus purified and warmed, passes through bulls'-eyes into the diffusing chamber under the House of Lords, where nearly 40,000 cubic feet of air, freed from all impurities, are constantly kept ready for admission into the House. The air next passes up flues in the wall of the Victoria Hall next the House, into the supply chambers over the ceilings. In the opposite wall is the discharge shaft and chimney to the steam-engine; and in the latter a steam-jet, by the action of which the vitiated air is drawn off, whilst a constant stream of similar air is rising from the House through the perforated enrichments of the beams in the central division of the ceiling; and to keep up the supply, thus incessantly but imperceptibly passing off, a current of fresh air is, equally imperceptibly, always pouring down, through the open work in the beams at the side divisions of the ceiling, to the floor of the House. Here the two currents meet in the centre, and ascend to the foul air chamber, whence, by the action of the steam-jet, they are rapidly drawn away. There are, also, modes of regulating the temperature by the doors of flues, by cold water, &c. The most ingenious adaptation is that of the shaft, which conveys the smoke from the steam-boiler, also carrying off the vitiated air, this is invaluable, as the velocity of the air in the shaft caused by the heat of the boiler, independent of the heat evolved by the steam-jet, must always be very great. There are likewise portions of the House, in which the ornaments, (as quatrefoils,) are covered with wire-gauze, coloured so as to be imperceptible, through which the air passes.

The success of this system of diffusing air through the House, without draughts being perceptible, has been very nicely tested. For example, air which has been perfumed in a chamber at one end of the House has, in four or five minutes, been detected by its scent and in fifteen or sixteen minutes, all trace of perfume has passed off. Again, when nearly one hundred huge wax candles are burnt in the lofty candelabra, unprotected by any glass, the flames are as steady as they would be if the candles were burning in a small sitting-room.

(1) These dogs (or sword irons,) are equally characteristic, though in a different way, with the pair described by Shakespeare to have belonged to a lady's chamber, in his time:—

"Two winking cupids
Of silver, each on one foot standing, nicely
Depending on their brands."—*Cymbeline*.

(1) From the highly artistic details, accompanying a set of views in the *Illustrated London News*, drawn and engraved by Joseph Lionel Williams. For characteristic accuracy and picturesqueness, these illustrations can scarcely be too highly commended.

The whole of this system of heating and ventilation has been invented by Mr. Barry; its perfection, it will be seen, is based upon the sound principle of the property of heated air to ascend, and cold air to descend.

The gas-lights are upon Professor Faraday's system, by which carbonic acid gas, and other deleterious products of combustion, are prevented from entering the lighted apartment. The action is simply this: the air rushes through a perforated plate, to supply the gas flame, and having parted with its oxygen rises over the chimney, and being prevented from escaping at top, (by its covering of a plate of mica,) passes between inner and outer glasses, through small tubes, into a larger one, and thence makes its exit. Thus, though the gas is burning brightly, there is no absorption of fresh air from the apartment to supply the flame.

As a specimen of the architectural character of the accessories, we may refer to the candelabra in the House of Lords, in which the tracery and quatrefoils, fillets and mouldings, of the enriched shafts, and the crowned flying buttresses, or branches for the lights, show how essential to the perfection of house-fitting is the master-mind of the architect.

With respect to the acoustic provisions in the House, so as to ensure its fitness for debating, experience alone can testify. The deeply-recessed ceiling, the perforated beams, the niches, the coving beneath the galleries, and other deviations from a plane surface, are unfavourable to hearing. The size of the chamber must also be taken into account, it being nearly four times the dimensions of the former house.

Although our eulogy of the decorative beauty of the House and the Hall may appear highly charged, we are persuaded that when the sculpture, frescoes, and painted glass shall be completed, the effect of magnificence will be astonishingly increased.

A walk through "the works," or the buildings in progress, is suggestive of many gratifying reflections. The style of architecture, it is true, belongs to a distant age; but its adaptation to "high convenience" belongs to our own time. In plan and arrangement, for official purposes, too numerous for us to specify, the new houses will be as near perfection as can be attained. A single glance at the ground plan will show that we do not over-estimate these important provisions.

There are many novel points of construction upon which we could enlarge; for instance, the employment of iron wherever it can be substituted for wood; the diminished liability to destruction by fire; added to which, the floors are fire-proof; the most prompt supplies of water are insured, and means of instantly cutting off communication in case of fire are provided. The novel applications of mechanical power to be seen in the works—the removal of vast masses of stone, for instance, upon railways, high in mid-air, are strikingly indicative of our own age: as is the carving, in great part, executed by machinery; thus substituting the work of an instant for the labour of a day, week, or even month.

The reader is probably aware that the decorative portion of the New Houses has been placed under the direction of a Commission, at the head of which is his Royal Highness Prince Albert. This measure has, doubtless, been productive of good, by the way of suggestion.

It is important to note, that so vast a work of art as the re-edification of "the Houses" has already called into action young and rising genius. The artists to whom the frescoes have been entrusted present instances; and, in the sculptural decoration we must mention Mr. John Thomas, of Lambeth, to whom the execution of two of the figures of the Magna Charta Barons has been confided.

To return to the outer works,—their present state can but be glanced at. The Victoria, Clock, and Octagonal Towers have not risen far above the main building. The completion of the House of Commons is a more important demand, though it is doubtful if this can be

accomplished by the meeting of Parliament next year. In general plan, the House, Lobby, &c. will correspond with that of the Lords, though it will be far less ornate than the Peers' House. The Victoria Gallery, and the great Central Hall will be structures of great novelty, as well as beauty.

We conclude in the words of the contemporary,¹ to whom acknowledgment is due for the substance of a few of these details, originally derived from official sources.

"The rebuilding of the Houses of Parliament, or, 'the Palace of Westminster,' is the most important architectural work which has been undertaken in this country since the re-edification of St. Paul's Cathedral. So colossal a pile of building has not been erected in London since that period; nor so magnificent a specimen of Gothic architecture in England since the construction of Henry the Seventh's chapel. And, it may be added, that, in arrangement, detail, warming, and ventilation, combined, so perfect a structure was never before planned; as far as can be judged from the recorded art of past ages, or the experience of our own time."

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.²

CHAP. VII.

A MYSTERIOUS LETTER.

THE next few days passed like a happy dream. Our little party remained the same, no tidings being heard of any of the absentees, save a note from Freddy, saying how much he was annoyed at being detained in town, and begging me to await his return at Elm Lodge, or he would never forgive me. Mrs. Coleman's sprain, though not very severe, was yet sufficient to confine her to her own room till after breakfast, and to a sofa in the boudoir during the rest of the day; and, as a necessary consequence, Miss Saville and I were chiefly dependent on each other for society and amusement. We walked together, read Italian (Petrarch too, of all the authors we could have chosen to beguile us, with his picturesque and glowing love conceits), played chess, and, in short, tried in turn all the usual expedients for killing time in a country-house, and found them all very "pretty pastime" indeed. As the young lady's shyness wore off, and by degrees she allowed the various excellent qualities of her head and heart to appear, I recalled Lucy Markham's assertion, that "she was as good and amiable as she was pretty," and acknowledged that she had only done her justice. Still, although her manner was generally lively and animated, and at times even gay, I could perceive that her mind was not at ease; and, whenever she was silent, and her features were in repose, they were marked by an expression of hopeless dejection which it grieved me to behold. If at such moments she perceived any one was observing her, she would rouse herself with a sudden start, and join in the conversation with a degree of wild vehemence and strange unnatural gaiety, which to me had in it something shocking. Latterly, however, as we became better acquainted, and felt more at ease in each other's society, these wild bursts of spirits grew less frequent, or altogether disappeared, and she would meet my glance with a calm melancholy smile, which seemed to say, "I am not afraid to trust you with the secret of my unhappiness—you will not betray me." Yet though she seemed to find pleasure in discussing subjects which afforded opportunity for expressing the morbid and desponding

(1) The "Illustrated London News."

(2) Continued from p. 182.

views she held of life, she never allowed the conversation to take a personal turn, always skilfully avoiding the possibility of her words being applied to her own case; any attempt to do so invariably rendering her silent, or eliciting from her some gay piquant remark, which served her purpose still better.

And how were my feelings getting on all this time? Was I falling in love with this wayward, incomprehensible, but deeply interesting girl, into whose constant society circumstances had, as it were, forced me? Reader, this was a question which I most carefully abstained from asking myself. I knew that I was exceedingly happy: and, as I wished to continue so, I steadily forbore to analyze the ingredients of this happiness too closely, perhaps from a secret consciousness, that, were I to do so, I might discover certain awkward truths, which might prove it to be my duty to tear myself away from the scene of fascination, ere it was too late. So I told myself that I was bound by my promise to Coleman to remain at Elm Lodge till my mother and sister should return home, or, at all events, till he himself came back. This being the case, I was compelled by all the rules of good-breeding to be civil and attentive to Miss Saville, (yes, civil and attentive,—I repeated the words over two or three times; they were nice, quiet, *cool* sort of words, and suited the view I was anxious to take of the case particularly well.) Besides, I might be of some use to her, poor girl, by combating her strange, melancholy, half-fatalist opinions; at all events, it was my duty to try, decidedly my duty (I said that also several times); and, as to my feeling such a deep interest about her, and thinking of her continually, why there was nothing else for me to think about at Elm Lodge—so that was easily accounted for. All this, and a good deal more of the same nature, did I tell myself; and, if I did not implicitly believe it, I was much too polite to think of giving myself the lie, and so I continued walking, talking, reading Petrarch, and playing chess with Miss Saville all day, and dreaming of her all night, and being very happy indeed.

Oh! it's a dangerous game, by the way, that game of chess, with its gallant young knights, clever fellows, up to all sorts of deep moves, who are perpetually laying siege to queens, keeping them in check, threatening them with the bishop, and, with his assistance, mating at last; and much too nearly does it resemble the game of life to be played safely with a pair of bright eyes talking to you from the other side of the board, and two coral lips—mute, indeed, but in their very silence discoursing such "sweet music" to your heart, that the silly thing, dancing with delight, seems as if it meant to jump out of your breast; and it is not mere seeming, either—for hearts have been altogether lost in that way before now. Oh! it's a dangerous game, that game of chess. But, to return to my tale.

About a week after the expedition to Mrs. Muddles's had taken place, Freddy and his father returned, just in time for dinner. As I was dressing for that meal, Coleman came into my room, anxious to learn "how the young lady had conducted herself" during his absence; whether I had taken any unfair advantage, or acted honourably, with a due regard to his interest, with sundry other queries of a like nature, all of which appeared to me exceedingly impertinent, and particularly disagreeable, and inspired me with a strong inclination to take him by the shoulders and march him out of the room; instead, however, of doing so, I endeavoured to look amiable, and answer his inquiries in the same light tone in which they were made, and I so far succeeded as to render the amount of information he obtained exceedingly minute. The dinner passed off heavily; Miss Saville was unusually silent, and all Freddy's sallies failed to draw her out. Mr. Coleman was very pompous, and so distressingly polite, that every thing like sociability was out of the question. When the ladies left us, matters did not improve; Freddy, finding the atmosphere ungenial to jokes,

devoted himself to cracking walnuts by original methods which invariably failed, and torturing into impossible shapes oranges which, when finished, were much too sour for any one to eat; while his father, after having solemnly, and at separate intervals, begged me to partake of every article of the dessert twice over, commenced an harangue, in which he set forth the extreme caution and reserve he deemed it right and advisable for young gentlemen to exercise in their intercourse with young ladies, towards whom he declared they should maintain a staid deportment of dignified courtesy, tempered by distant but respectful attentions—this, repeated with variations, lasted us till the tea was announced, and we returned to the drawing-room. Here Freddy made a desperate and final struggle to remove the wet blanket which appeared to have extinguished the life and spirit of the party, but in vain; it had evidently set in for a dull evening, and the clouds were not to be dispelled by any efforts of his;—nothing, therefore, remained for him but to tease the cat, and worry and confuse his mother, to which occupations he applied himself with a degree of diligence worthy a better object. During a fearful commotion consequent upon the discovery of the cat's nose in the cream jug, into the commission of which delinquency Freddy had contrived to inveigle her by a series of treacherous caresses, I could not help remarking to Miss Saville (next to whom I happened to be seated) the contrast between this evening and those which we had lately spent together.

"Ah! yes," she replied, in a half-absent manner, "I knew they were too happy to last;" then seeing from the flush of joy, which I felt rise to my brow, though I would have given worlds to repress it, that I had put a wrong construction on her words, or, as my heart would fain make me believe, that she had unconsciously admitted more than she intended, she added hastily, "What I mean to say is, that the perfect freedom from restraint, and the entire liberty to—*to follow one's own pursuits*, are pleasures to which I am so little accustomed, that I have enjoyed them more than I was perhaps aware of while they lasted."

"You are out of spirits this evening. I hope nothing has occurred to annoy you?" inquired I.

"Do you believe in presentiments?" was the rejoinder.

"I cannot say I do," returned I; "I take them to be little else than the creations of our own morbid fancies, and attribute them in great measure to physical causes."

"But why do they come true, then?" she inquired.

"I must answer your question by another," I replied, "and ask whether, except now and then by accident, they do come true?"

"I think so," returned Miss Saville, "at least I can only judge as one usually does, more or less, in every case, by one's own experience,—my presentiments always appear to come true; would it were not so! for they are generally of a gloomy nature."

"Even yet," replied I, "I doubt whether you do not unconsciously deceive yourself, and I think I can tell you the reason; you remember the times when your presentiments have come to pass, because you considered such coincidences remarkable, and they made a strong impression on your mind, while you forget the innumerable gloomy forebodings which have never been fulfilled, the accomplishment being the thing which fixes itself on your memory—is not this the case?"

"It may be so," she answered, "and yet I know not,—even now there is a weight here," and she pressed her hand to her brow, as she spoke, "a vague, dull feeling of dread, a sensation of coming evil, which tells me some misfortune is at hand, some crisis of my fate approaching. I dare say you consider all this very silly and romantic, Mr. Fairleigh; but if you knew how everything I have most feared, most sought to

avoid, has invariably been forced upon me, you would make allowance for me—you would pity me."

What answer I should have made to this appeal, had not Fate interposed, in the person of old Mr. Coleman, (who seated himself on the other side of Miss Saville, and began talking about the state of the roads,) it is impossible to say. As it was, my only reply was by a glance, which if it failed to convince her that I pitied her with a depth and intensity which approached alarmingly near the kindred emotion, love, must have been singularly inexpressive. And the evening came to an end, as all evenings, however long, are sure to do at last; and in due course I went to bed, but not to sleep, for Clara Saville and her forebodings ran riot in my brain, and effectually banished the "soft restorer," till such time as that early egotist the cock began singing his own praises to his numerous wives, when I fell into a doze, with a strong idea that I had got a presentiment myself, though of what nature, or when the event (if event it was) was likely to "come off," I had not the most distant notion.

The post-bag arrived while we were at breakfast the next morning; and it so happened that I was the only one of the party for whom it did not contain a letter. Having nothing, therefore, to occupy my attention, and being seated exactly opposite Clara Saville, I could scarcely fail to observe the effect produced by one which Mr. Coleman had handed to her. When her eye first fell on the writing, she gave a slight start, and a flush (I could not decide whether of pleasure or anger) mounted to her brow. As she perused the contents she grew deadly pale, and I feared she was about to faint: recovering herself, however, by a strong effort, she read steadily to the end, quietly refolded the letter, and placing it in a pocket in her dress, apparently resumed her breakfast—I say apparently, for I noticed that, although she busied herself with what was on her plate, it remained untasted, and she took the earliest opportunity, as soon as the meal was concluded, of leaving the room.

"I'm afraid I must ask you to excuse me till after lunch, old fellow," said Coleman, "you see we're so dreadfully busy just now with this confounded suit I went down to Bury about—'Bowler *versus* Stumps'; but if you can amuse yourself till two o'clock, we'll go and have a jolly good walk to shake up an appetite for dinner."

"The very thing," replied I; "I have a letter to Harry Oaklands, which has been on the stocks for the last four days, and which I particularly wish to finish, and then I'm your man, for a ten mile trot if you like it."

"So be it, then," said Freddy, leaving the room as he spoke.

As soon as he was gone, instead of fetching my half-written epistle, I flung myself into an arm-chair, and devoted myself to the profitable employment of conjecturing the possible cause of Clara Saville's strange agitation on receiving that letter. Who could it be from?—perhaps her guardian—but if so, why should she have given a start of surprise?—nothing could have been more natural or probable than that he should write, and say when she might expect him home—she could not have felt surprise at the sight of his handwriting—but if not from him, from whom could it come? She had told me she had no near relations, no intimate friend. A lover perchance—well, and if it were so, what was that to me?—nothing—oh yes! decidedly nothing—a favoured lover of course, else why the emotion?—was this also nothing?—yes, I said it was, and I tried to think so too, yet I wonder why I sprang from my seat as if an adder had stung me, and began striding up and down the room as though I were walking for a wager. In the course of my rapid promenade my coat-tail brushed against, and nearly knocked down an inkstand, to which incident I was indebted for the recollection of my unfinished letter to Oaklands, and,

my own thoughts being at that moment no over pleasant companions, I was glad of any excuse to get rid of them. On looking about for my writing-case, however, I remembered that, when last I made use of it, we were sitting in the boudoir, and that there it had probably remained ever since, accordingly without farther waste of time, I ran up stairs to look for it.

As good Mrs. Coleman (although she always indignantly repelled the accusation) was sometimes accustomed to indulge her propensity for napping even in a morning, I opened the door of the boudoir, and closed it again after me, as noiselessly as possible. My precautions, however, did not seem to have been necessary, for at first sight the room appeared untenanted—but as I turned to look for my writing-case, a stifled sob met my ear, and a closer inspection enabled me to perceive the form of Clara Saville, with her face buried in the cushions, half-sitting half-reclining on the sofa, while so silently had I effected my entrance, that as yet she was not aware of my approach. My first impulse was to withdraw and leave her undisturbed, but unluckily a slight noise which I made in endeavouring to do so, attracted her attention, and she started up in alarm, regarding me with a wild half-frightened gaze, as if she scarcely recognised me.

"I beg your pardon," I began hastily, "I am afraid I have disturbed you—I came to fetch—that is to look for—my—" and here I stopped short, for to my surprise and consternation, Miss Saville, after making a strong but ineffectual effort to regain her composure, sank back upon the sofa, and covering her face with her hands, burst into a violent flood of tears. I can scarcely conceive a situation more painful, or in which it would be more difficult to know how to act, than the one in which I now found myself. The sight of a woman's tears must always produce a powerful effect upon a man of any feeling, leading him to wish to comfort and assist her to the utmost of his ability; but, if the fair weeper be one in whose welfare you take the deepest interest, and yet with whom you are not on terms of sufficient intimacy to entitle you to offer the consolation your heart would dictate, the position becomes doubly embarrassing. For my part, so overcome was I by a perfect chaos of emotions, that I remained for some moments like one thunder-stricken, while she continued to sob as though her heart were breaking. At length I could stand it no longer, and scarcely knowing what I was going to say or do, I placed myself on the sofa beside her, and taking one of her hands, which now hung listlessly down, in my own, I exclaimed:—

"Miss Saville—Clara—dear Clara! I cannot bear to see you so unhappy, it makes me miserable to look at you—tell me, what can I do to help you—to comfort you—something must be possible—you have no brother—let me be one to you—tell me why you are so wretched—and oh! do not cry so bitterly."

When I first addressed her, she started slightly, and attempted to withdraw her hand, but as I proceeded, she allowed it to remain quietly in mine, and though she still continued to weep, her tears fell more softly, and she no longer sobbed in such a distressing manner. Glad to find that I had in some measure succeeded in calming her, I renewed my attempts at consolation, and again implored her to tell me the cause of her unhappiness. Still for some moments she was unable to speak, but at length making an effort to recover herself, she withdrew her hand, and stroking back her glossy hair, which had fallen over her forehead, said:—

"This is very weak—very foolish. I do not often give way in this manner, but it came upon me so suddenly—so unexpectedly; and now, Mr. Fairleigh, pray leave me. I shall ever feel grateful to you for your sympathy, for your offers of assistance, and for all the trouble you have kindly taken about such a strange, wayward girl, as I am sure you must consider me," she added with a faint smile.

"So you will not allow me to be of use to you,"

returned I, sorrowfully; "you do not think me worthy of your confidence."

"Indeed it is not so," she replied earnestly; "there is no one of whose judgment I think more highly; no one whose assistance I would more gladly avail myself of; on whose honour I would more willingly rely; but it is utterly impossible to help me. Indeed," she added, seeing me still look incredulous, "I am telling you what I believe to be the exact and simple truth."

"Will you promise me that, if at any time you should find that I could be of use to you, you will apply to me as you would to a brother, trusting me sufficiently to believe that I shall not act hastily, or in any way which could in the slightest degree compromise or annoy you. Will you promise me this?"

"I will," she replied, raising her eyes to my face for an instant with that sweet, trustful expression which I had before noticed, "though I suppose such prudent people as Mr. Coleman," she added with a slight smile, "would consider me to blame for so doing; and were I like other girls—had I a mother's affection to watch over me—a father's care to protect me, they might be right; but situated as I am, having none to care for me—nothing to rely on save my own weak heart and unformed judgment—while those who should guide and assist me appear only too ready to avail themselves of my helplessness and inexperience, I cannot afford to lose a friend, or believe it to be my duty to reject your disinterested kindness."

A pause ensued, during which I arrived at two conclusions, first, that my kindness was not altogether so disinterested as she imagined, and secondly, that if I sat where I was much longer, and she went on talking about there being nobody who cared for her, I should inevitably feel myself called upon to undeceive her, and, as a necessary consequence, implore her to share my heart and patrimony, the latter, deducting my sister's allowance and my mother's jointure, amounting to the imposing sum of 90*l.* 14*s.* 6*d.* per annum, which, although sufficient to furnish a bachelor with bread and cheese and broad-cloth, was not exactly calculated to afford an income for "persons about to marry." Accordingly, putting a strong force upon my inclinations, and by a desperate effort screwing my virtue to the sticking point, I made a pretty speech, clenching and thanking her for her promise of applying to me to help her out of the first hopelessly inextricable dilemma in which she might find herself involved, and rose from the sofa with the full intention of leaving the room.

FATHER EUSTACE.¹

ONE of the most strongly marked, and not least characteristic, features of the present day, is the mania for light reading which pervades all classes of society, and the strange and anomalous publications to which this taste has given rise. The novel, being the form pronounced by common consent to have attained the minimum of specific gravity, is the vehicle almost invariably selected by modern authors to convey to the public, not only their thoughts and feelings, but their very principles also. Nothing is in these days considered too high or too low to form the subject of a popular novel: religion, philosophy, politics, science, the tittle-tattle of the servants' hall, and the sayings and doings of house-breakers and pickpockets, are deemed equally appropriate, and the scene varies with a laudable impartiality from St. James's to St. Giles's—from the palace of the noble to the crowded night-cellar. No distrust of their

own powers, nor doubt as to the fitness of the weapons employed, ever seems to occur to these champions of the quill, and accordingly we find one writer levelling his novel at the absolutism of the Autocrat of all the Russias, while another knight of the inkblender modestly proposes to reform the constitution, and extirpate all the hydra-headed abuses of our social system, by the wisdom of a new generation, to whose young ideas he appears not unwilling to play schoolmaster. Among the ranks of these regenerators of society Mrs. Trollope has enrolled herself; with the same free pen which delineated the Widow Barnaby and the Attractive Man, she undertakes to overthrow the fabric designed by the gigantic intellect of Ignatius Loyola, and following in the footsteps (at what distance we do not feel called upon to declare) of the Juif Errant, started on a new crusade against the Brethren of the Propaganda.

Although we are not among the number of those who discover in every well dressed man with dark hair and a sallow complexion, whom they may chance to sit next at a dinner party, a concealed Jesuit, while they lustre the white-waistcoated waiter behind their chair with the mysterious attributes of a "temporal coadjutor," and are unable to participate in the fears of a venerable lady of our acquaintance residing on the southern coast, whose peace of mind is destroyed by visions of an armed force commanded by the General of the Jesuits (who, from the military nature of his title, she deems a kind of warrior-priest), landing in front of her drawing-room windows, to make proselytes at the point of the bayonet;—although we cannot sympathise with these alarmists, we are not unwilling to allow that, at a time when the unprecedented efforts making by the Church of Rome to obtain converts, have been in too many instances successful, it may be right and advisable to direct public attention to the deceitful principles, false doctrines, and subtle machinations, of the disciples of Loyola; but we greatly doubt the propriety of making the pages of a pseudo-fashionable novel the vehicle by which to carry out such an intention, and we feel "very particularly sure" (to use one of Mrs. Trollope's favourite expressions) that the authoress of the Vicar of Wrexhill is the last person we should have selected to execute the design. Mrs. Trollope's contributions to the novel-literature of England have within the last fifteen years been dealt forth with no sparing hand, and the popularity they have attained is perhaps the surest proof we can adduce of their containing evidence of considerable talent; but, in nearly all the works of fiction which have proceeded from this lady's prolific pen, two very serious faults are discernible, which in our opinion all her talent and knowledge of the world are insufficient to counterbalance. The first of these faults is a disposition to exaggeration and caricature, carried to such a length as to set nature and probability completely at defiance, and which in the work at present under our notice, has led her into such glaring absurdities as would be simply ludicrous, did they not, from the solemn nature of the subjects treated of, become positively profane. The second accusation we have to bring against Mrs. Trollope (for she unfortunately differs from the hero of one of her best productions in an important particular, and we feel we should be treating her with a culpable degree of lenity were we to concentrate her offences within the limits of "one fault") is, that, both by word and deed, in language and in plot, she is too often guilty of a sin, which, highly offensive in a man's writing, becomes unpardonable in that of a woman;—we allude (and we do so with a feeling of pain that any woman should have laid herself open to such an accusation) to the coarse jests, *double-entendres* whose meaning is only too unequivocal, situations of more than doubtful propriety, and, in many cases, to some glaring immorality in the construction of the story itself, which disgrace the pages of this authoress, and render her works unfit in our judgment to be admitted into any family circle. Of this latter fault "Father Eustace" affords a striking example; and, when

(1) *Father Eustace*, a tale of the Jesuits, by Mrs. Trollope; Author of "The Vicar of Wrexhill," "The Barnaby," &c. 3 vols.: Henry Colbourn.

we add that the irreverence with which religious subjects are handled exceeds the usual flippancy of self-sufficiency of newspaper theology, we think we have carried our censures to a pitch at which we may fairly be called upon to prove our words. To do so fully, and convince the reader that we have neither falsified facts, nor "set down aught in malice," we must refer him to the book itself, as the limits of a magazine necessarily restrict us to a brief sketch of the story, while for the same reason we are unable to avail ourselves of more than an infinitesimal proportion of the extracts, which every page would afford, to illustrate our position.

Mrs. Trollope breaks ground by introducing the reader to the death-bed of Richard Randolph de Morley, the wealthy owner of Cuthbert Castle, who, having lived a zealous Roman Catholic, is now dying, "attended by all the forms appointed by his *hieroglyphic faith*," (the italics are our own), accompanied by "enough of ecclesiastical splendour to atone to the imagination for superseding the tragedy of nature by the pomp and solemnity of ceremonious (quarry *al*) rites." After being thus made acquainted with the new and startling fact that extreme unction *supersedes* death, for such must be the meaning of the sentence we have just quoted, (if, indeed, it mean anything,) we learn that the conscience of the dying man is burdened by the sin of having married a Protestant; the fruit of this ill-assorted union being an only daughter, on whom are strictly entailed the vast estates of the De Morleys, and who, according to a stipulation agreed on before the marriage, has been educated in the Protestant faith. The penitent laments his misdeeds, and his want (owing to the entail) of power to atone for them; and, having been urged by the attendant priest to sign a paper bequeathing a certain casket of jewels to be expended in masses for the good of his soul, dies in attempting to do so.

We forbear making farther extracts from this chapter, and content ourselves with remarking, that the tone throughout borders so closely on profanity, as fully to bear out our strictures upon that point. Mr. De Morley, despite the "superseding" qualities of extreme unction, being positively dead, the priest presents himself to the widow and daughter to announce the melancholy fact, and is greeted by Lady Sarah, who seems to have been anything but an affectionate wife, and whose character is described as "possessing a sternness of truth which rendered the idea of appearing to feel a sorrow, which in fact was foreign to her breast, detestable," in the following words:—

"I presume that I am not mistaken as to the nature of your errand, Father Ambrose; I presume that you come to announce the death of my husband."

On learning that she is not mistaken in her supposition, she enters into a squabble with the worthy father regarding the possession of the casket of jewels, in the course of which she lays down the law with the precision and good taste of an Old Bailey counsel. The daughter, however, having some touch of natural feeling about her, accompanies the priest to the plate-closet, and places in his hands the coveted casket; the contents of which Mrs. Trollope thinks it necessary to inform us he had "no intention of appropriating to himself."

Weeks glide by, the men-servants who were Romanists have been replaced by good and true Protestants, and having banished all traces of the detested religion of her late husband, the happiness of his singularly *un-disconsolate* (if we may be allowed to coin a word) widow would be complete, were it not that, for some reason best known to himself, Father Ambrose still "continues to linger," a line of conduct all the more extraordinary on his part, because as Lady Sarah pointedly remarks, "he has got all he is likely to get;" still, however, "he lingers on" until he has had a private conversation with a gardener, so very private, indeed, that as (to the best of our belief) not the slightest mention of it, or reference to it, is again made in the whole course of the book, we humbly conceive that it

is hardly worth the fuss made about it, and might have been omitted altogether without materially injuring the story.

Having at length accomplished this important object, he gladdens Lady Sarah's heart by announcing his departure for the following Friday. The widow, during an after-dinner conversation with her daughter, describes the effect produced on her by this communication, in the following speech, in the first sentence of which we are inclined to think her ladyship must have unconsciously hit upon the truth.

"My dear, I feel very much as if I were intoxicated; do say something sober, and very rational to me, Juliana, that I may be brought back to a sense of my human condition, and not fancy that I am *actually in the very act of entering the gates of Paradise*. Oh! Ju! Ju! Ju! my pretty little Ju! is it a sin to feel so exquisitely, so unspeakably happy as I do at this moment?"

The effect produced on "Ju" by this rhapsody was, that "she stared at her mother in silence," and a very natural effect we consider it to have been. As soon as she is thus relieved from the double incubus of her husband and his confessor, Lady Sarah flings dull care away, and determines to see a little of life—accordingly, by the assistance of Mr. Wardour, the rector of the parish, who it appears has been an old flame of hers, she summons all the rank and fashion of the neighbourhood to Cuthbert Castle—and such inconceivable specimens of rank and fashion as Mrs. Trollope is pleased to introduce us to, it has most assuredly never been our fate elsewhere to encounter.

The daughter of a duke, who talks like a vituperative kitchen-maid—the opulent widow of a manufacturer, whose introduction of her youngest son elicits from that individual the expostulation "Oh! don't, mother;" which leads to the maternal rejoinder of "I must, my angel,"—a certain Miss Stanberry, in whose veins runs the warm blood of sunny Italy, who, deeply enamoured of a Mr. Curtis, the ten thousand per annum prize of the neighbourhood, and jealous of her pretty cousin, endeavours to neutralize her charms by the highly natural expedient of making her go out to play waltzes at evening parties, attired in a thick shawl and a head-dress, "that looked exceedingly like a night-cap," a disguise which answers its purpose so effectually, that a friend who meets her in a cottage bonnet, is unable to recognise in the lovely girl before her, the "mobbled musician" of the preceding evening;—these are but a few examples chosen at random from the mass of incongruous absurdities, by aid of which Mrs. Trollope has embodied her idea of county society; but time, which will not permit us to do more than glance at these "pleasant passages," and prevents our entering upon an interesting etymological inquiry as to the derivation and possible meaning of the word "*mobbled*," warns us not to dwell longer upon this portion of our subject: we will, therefore, proceed at once to the main plot of the book.

Antonio Scaviatoli, the General of the Society of Jesus, excited by the report of Father Ambrose, resolves to secure for the brotherhood of which he is the head, the immense revenues of the De Morley family, an object which he proposes to attain by the conversion of the heiress, with the ultimate hope of inducing her to enter a convent. To this end he despatches to England Edward Stormont, alias Father Eustace, a young priest educated in the doctrine of passive obedience, till he has become a mere tool in the hands of his superiors. This emissary departs, with instructions to gain such an influence over Miss de Morley as may lead to the desired result—a task which, as he is represented to be a kind of Admirable Crichton, the perfection of talent and beauty, he appears well fitted to accomplish. Resuming his secular name, he takes a house in the neighbourhood of Cuthbert Castle, and, being introduced to the fair Juliana as a man of good family, establishes a sentimental friendship with that young lady, and by

singing a requiem with Gardoni-like pathos, and appealing to the memory of her deceased father, succeeds in converting her to Romanism. But here, or hereabouts, he makes the unfortunate discovery that he has fallen desperately in love with his proselyte, while he half suspects that she returns his affection. Even this contingency, however, has been provided against by the foresight of Scaviatoli, and Father Eustace has received directions "whenever he should become conscious of such feelings towards the daughter of Richard de Morley, as might threaten to endanger the success of his mission," to forward a letter to a certain William Mills, Esq. The effect of this communication is to summon to his assistance two other Jesuits, Father Edgar, the superior of the fraternity throughout England, and Sister Agatha, a nun of the order of the Sacred Heart. Under their able guidance the affair progresses rapidly, until one fine morning the unhappy Stormont is completely overwhelmed, by his fair convert's suddenly enlightening him as to the state of her affections, and informing him that she is perfectly ready, not to say anxious, to become his wife.

The way in which Father Edgar receives Eustace's agonised report of this communication, and the advice it elicits from him to take advantage of his convert's confiding innocence to effect her ruin, in order that she may be driven to hide her shame beneath the roof of a convent, at length arouses the spell-bound conscience of the young Jesuit; disgusted with such baseness, he throws up the game, and starts for Rome, in a fit of virtuous indignation, leaving a note for Juliana, informing her that he is a vowed monk, and has been employed to deceive her.

The interest of the story, such as it is, of course ends here. Scaviatoli lets Stormont down easy, by means of a trap-door, whence he emerges, after "seven long years are past and gone," to die at Juliana's feet, avowing himself a Protestant; which little act of constancy that young lady rewards by having him buried in the family vault.

The book closes with a due proportion of marrying and giving in marriage: the mobbed musician pairing off with the prize young gentleman, and Lady Sarah taking up with her old flame the rector; while Juliana, eschewing matrimony altogether, subsists upon fond recollections of the past, a light diet, which appears to have suited her case exactly, as we find her living to preside at the wedding of her mother's son, and her heir; an event which did not take place till the fortunate youth had attained the sober age of thirty.

Here we conclude this notice of "Father Eustace," we must ask the reader's patience while we make one or two remarks; firstly, upon the story itself, and, secondly, on the manner in which Mrs. Trollope has treated it; in doing which we shall endeavour to show that the charges we have brought against her—of irreverence, coarseness, and exaggeration—are not unfounded. Unless Mrs. Trollope has any positive knowledge of such a fact, we conceive she is wantonly and unjustifiably injuring the cause of religion in general, to an extent of which she is little aware, by leading the public mind to suppose it possible that the heads of any Christian community would calmly devise a scheme, the success of which must necessarily involve the commission of a crime of the most revolting character; but, even allowing that she has any authority to go upon, what shall we say for the taste of a lady who selects such a subject for the plot of a popular novel, and, dressing it up with a coarseness all her own, sends forth this admirable specimen of "light literature," to lie upon the work-tables and inform the minds of the daughters of England?

So much for the design of the work itself. Let us now see how Mrs. Trollope has executed the task she has undertaken:—The character of the young Jesuit is well imagined, and, with one or two glaring exceptions, ably executed; Scaviatoli, the successor of Loyola, is a

clever sketch, and the interviews which take place between the arch-priest and his soul-enraptured disciple form some of the best portions of the book; but such ridiculous anomalies as are presented to our notice in the persons of the Jesuit pair, Father Edgar and Sister Agatha, or anything to equal the style of conversation put into the mouths of these very reverend personages, no one unacquainted with Mrs. Trollope's peculiar talent in these respects, could for a moment conceive. One or two extracts will serve to illustrate our meaning:—

On his arrival at Langley Knoll (the place rented by Father Eustace) Father Edgar, who has never set eyes on his companion until that morning, addresses him as "Stormont, my good fellow!"—"My dear boy!"—invites him to "talk a little about this girl," calls Scaviatoli "the finest fellow he ever knew," advises Sister Agatha, alias Amelia Mills, "to take care always to be professional" when Eustace is present,—requests her when she "suspects there are more creating powers than one," "not to be blasphemous," lest he should "have to denounce" his "most perennially handsome Amelia" to his "charming friend the Abbess," has his Jesuitical indignation so deeply aroused by finding in the library of a Protestant gentleman on whom he is making a morning call, some "records of the various products of the unshackled mind of man," instead of "the heavy tomes of mystical erudition, saintly legend, party theology, and Jesuit logic, with which the *souls* and *cells* of the learned *ought* to be lined," that he "ground his teeth, clenched his fists, and in courses not loud, but very remarkably deep, doomed all those who had dared to write and read these accursed fruits of the human intellect, to everlasting torments." And, when Eustace confesses to him, in "what might be called a spasm of desperate resolution," his discovery that Juliana loves him, Father Edgar "looks at him with the air of one who feels a strong inclination to laugh," an inclination which returns with double force when "the aged monk" begins to hint at the final development of Scaviatoli's infamous design. In like manner, Sister Agatha, whose foible is an intense love of eating, which we here learn to be a "conventual peculiarity," and whose ambition it is to supersede the charming Abbess—has an after-dinner conversation with Miss Stanberry (Mrs. Trollope seems "very particularly" fond of making her female characters—truth forbids our calling them ladies—indulge in strange conversations *after dinner*), in which, with equal taste and delicacy, she informs the young lady, with whom she has scarcely a bowing acquaintance, that she "reads upon her noble brow" the fact of her "loving, passionately, devotedly loving, that *fine young man called Curtis*;" and arranges with her a little scheme for obtaining his hand, the details of which are of so disgusting a nature that we pass them over in silence, merely remarking that they involve an attempt to damage the fair fame of the pretty cousin and Lady Sarah de Morley, whose characters we should have considered unimpeachable. When in addition we inform the reader that Sister Agatha is thoroughly aware of Scaviatoli's whole design, and that a former *liaison* between her and Father Edgar is plainly hinted at—we consider that we have brought forward evidence amply sufficient to substantiate our charge of coarseness and immorality, and gladly quit a subject so unpleasant.

The careless amiability with which Juliana's internal convictions (for she never makes any open profession of her change of creed) oscillate between England and Rome, and the gentle indifference which pervades the "sorrow" of Mr. Wardour and Lady Sarah, as these changes are communicated to them, are worthy of note, as they afford us some slight insight into the stock-in-trade with which Mrs. Trollope starts as a religious writer. Of the mixture of absurdity and profaneness in the scene in which Miss De Morley's conversion, if conversion it can be called, takes place, we can only attempt to convey the most faint idea. Stormont having sung a requiem to, and accompanied himself upon an organ,

under pretext of "examining the bellows," leads Juliana into a popish chapel at the back of the library, and having prevailed upon her to kneel in prayer on the steps of an altar therein erected, arouses her from a fainting fit by imprinting a kiss upon her fair cheek, and in the frame of mind produced by this somewhat questionable discipline, induces her to embrace the tenets of the church of Rome. This altar, by the way, figures in a very original proceeding mentioned at the end of the third volume, and our last extract shall contain an account of this peculiar little ceremony, instituted by Miss De Morley, in commemoration, as we imagine, of her re-conversion to the Protestant faith. Having witnessed the last scene of Edward Stormont's life, which consists of his dying at the age of about five or six-and-thirty, in the character of "a very wretched old man," a sight which we learn with surprise "did her infinitely more good than harm," she "resumed her constant occupation of the library, and having removed all popish appendages from the altar, prevailed on Mr. Wardour without much difficulty to perform a short service of morning family prayer in it daily!" Should the reader, after this, wish to learn more particulars of the manner in which our authoress has treated her subject, we must once again refer him to the work itself.

Perhaps the most charitable thing we can suppose of Mrs. Trollope is, that she has unconsciously adopted one of the leading doctrines of the Society against which she is waging so furious a warfare, and has acted on the principle that the end justifies the means (for we do not for a moment doubt the excellence of her intentions); but, even imagining this to be the case, and that she conceives that by showing up the iniquitous practices of the Jesuits, she is doing good in her generation, it appears to us that she has failed in her object most signally. Surely it is an unwise step, and one likely to injure rather than to aid the cause of Christianity generally, to point out (not to say exaggerate) the evils and abuses existing in the church of Rome, without attempting in the slightest degree to contrast them with the working of a better and purer system in our own church. We would have forgiven Mrs. Trollope half the sins we have laid to her charge, had she drawn in the character of Mr. Wardour one of the many simple-minded, zealous, self-denying, truly devout parish priests, who, throughout the length and breadth of the land, are labouring, with failing health, and talents which might have commanded the highest prizes in the lottery of worldly fame, to win to the Church of Christ such as should be saved. A character thus delineated, standing out in bold contrast to the evil subtlety of the one, or the slavish obedience of the other Jesuit, might indeed have wrought a salutary effect upon the minds of her readers, and would have gone far in our opinion to redeem the work. But we are forgetting—Mrs. Trollope has already presented us with her picture of an Anglican Clergyman, in the Vicar of Wrexhill.

And with the pleasant feelings which the recollection of that book must always excite in us, we gladly take our leave of Mrs. Trollope.

THE PUBLIC WRITER; OR, THE EFFECTS OF GAMBLING.

M. VARANCHAU was a respectable citizen of Marseilles, who enjoyed a moderate patrimony; his ambition was very limited; he was quite satisfied with the retired position in life which Providence had assigned him, and desired nothing more than the continuance of a life so happy and peaceful. He possessed, at the gates of Marseilles, upon that high mountain on the summit of which is situated the Fort of Notre Dame de la Garde, a pretty villa, to which he walked every day; a large mulberry-tree shaded the cottage, and the lawn

sloped down to the borders of an adjoining wood. In the garden were lovely roses and jessamines, superb pinks and carnations; truly this delightful retreat was the paradise of M. Varanchau, where all his time was passed, and where he hoped to end his days. He had an only son, whom he loved with the most devoted tenderness, and perhaps with the too weak indulgence of a fond father. Being a widower for many years, he had centred all his affections upon "Severin;" he gave him an excellent education, and took great pleasure in instructing him in history and geography, with which he himself was very well acquainted. Without being exactly a learned man, M. Varanchau had received a solid education; he wrote with much ease and elegance; but it never occurred to him to employ his talent for composition, except in compiling little summaries for his son's use.

Severin's childhood was a very happy one; his father having facilitated the difficulties of his first studies, he did not, like most young people, think them dry and uninteresting, as he was always taught with kindness and gentleness. Having completed his classical education at seventeen years of age, his father deemed it advisable to send him to Paris to study for the bar. One day, when they were alone at the cottage, M. Varanchau made him sit down beside him under the large mulberry-tree, and said to him, with a voice full of sadness: "My dear son, the time is now come when we must part for a time; you are now of an age to choose a profession, and that of a notary seems to suit your turn of mind. I will spare no expense for your advancement in life, and will purchase an office for you as soon as you shall have finished your studies; but in the mean time you must go to Paris to pursue them there. I will divide my income into two parts; you shall have the largest, and I the smallest portion. I can live upon very little, as it is my intention to come and reside here altogether. You weep! My dear son, your tears are a proof of your affectionate disposition; and I see with delight that you are not insensible to this separation, which is still more painful to me than to you; but let us cheer up!—it will be but for a time,—and it will depend upon your diligence and good conduct to hasten our reunion."

Severin embraced his father, and promised to be all he could wish. "I will study day and night," said he; "I will endeavour, by my industry, to repay you for all you have done for me: I shall soon be rich; and then, father, we shall be happy."

"Not more happy than I am now," replied Varanchau, raising his head; "I am not ambitious for you,—I was never so for myself;—my only desire is to see you united to a good and virtuous woman, like your mother, and the possessor of a fortune sufficient to enable us all to live comfortably together. Do not covet riches; that which is obtained quickly, and without labour, is generally acquired by dishonest means; and especially, my dear son, be honourable in all your actions."

In a few days Severin set out for Paris, having received his father's blessing, and best advice as to the conduct he was to observe in the new life upon which he was entering, and furnished with a purse of a thousand crowns. His father accompanied him to the diligence, and, for some time after it had set off, he remained standing in the middle of the street, following with his eyes the vehicle which bore away the object of all his affections. "Well," said he (wiping away the tears, which were flowing fast), "he will return for the vacation; and, if I feel too lonely without him, I can go to him."

Severin's first letters were filled with regrets, expressions of loneliness, and good resolutions. Every time that M. Varanchau received one from him, he became quite affected, and said, with tenderness, "What a good son!—what an affectionate disposition!—oh, he never

will cause me one moment's disquietude!" Then, this worthy man would return more contented to his little cottage; he planted and arranged his pleasure-ground, saying to himself, "Severin will find our hermitage much improved; he will be pleased to see these striped roses, and those heaths which will be covered with blossom before the end of autumn;—oh, I should wish every flower to be in blow when he returns!"

Soon, however, his letters to his father became fewer and colder; he only wrote a few lines every month to inquire politely for his father's health; but never said anything of himself, his studies, or amusements. His kind parent became very uneasy at this change in him; but still his fondness was always suggesting some excuse for his apparent neglect:—"My poor son is working hard," he would say; "it would be very unjust in me to monopolize altogether the little time he has for recreation. Oh, how I long for his return!"

Things went on thus till the vacation; then he received a long letter from him filled with confused sentences, and concluded by a request for money; also saying that he should not be able to set out immediately for Marseilles, owing to a sprain that would confine him to his room for several days. This letter contained many falsehoods, which any one with more penetration than M. Varanchau would have readily perceived and resented; but he, with his usual indulgence, was only alive to his sufferings, and thus excusing him, said:—"My son is ill, confined to his room, perhaps without any one to care for him; he is not dangerously ill, but still he is in pain; and, besides, how lonely he must be without any one to administer to his wants, or to read to him! I will go to him myself, and we will pass the vacation together,—what matters it, whether it be in Marseilles or Paris? But, my pretty cottage!—my beautiful flowers!—I should, however, have had great pleasure in showing them to him!"

As M. Varanchau bade adieu to his cottage, he could not help shedding tears; it was the first time he had quitted his native town, and for fifty years he had never lost sight of the great clock of Saint Laurent. At the end of a week he arrived in Paris, and would not allow himself to be announced, as he was sure of finding Severin at home, being ill, and obliged to keep his room. "Madame," said he, as he saluted the landlady of one of the largest and most smoky houses in the street Parcheminerie, "does M. Severin Varanchau, a young law student, lodge here?"

"Are you come to dinner?" said the fat woman, roughly.

"Yes, Madame, I am come to dine and sleep here."

"I fear you cannot sleep here," replied she, "as there is only one bed in M. Severin's room; and, indeed, a fine noisy companion you would have in him! but, as to dinner, that will only make the difference of another dish. You will find the young gentleman's apartment on the fourth story, the fifth door to the left;—and will you say that I am gone to wash the glasses?"

He ascended quickly to his son's room, carrying his valise under his arm. "Well," thought he to himself; "Severin must be much better, since they are preparing his dinner. My poor son; how delighted he will be to see me!" He knocked gently at a little door.

"Come in!" cried Severin.

M. Varanchau opened the door, and was astonished at the scene which presented itself. In the midst of a cloud of smoke, he saw three young men playing cards. Severin, with an excited countenance, was standing behind one of them with a cigar in his mouth. The greatest disorder reigned in this room; the chairs being covered with clothes, boots, and torn books, and the floor strewed with empty bottles and broken glasses. M. Varanchau hesitated almost to enter, and exclaimed, at the door, "My dear son!"

"My father!" said Severin, as he flew to embrace him.

It is but just to say, that the young man was sincere in his joy at again seeing his indulgent parent; but, as

soon as the first greetings were over, he became overwhelmed with shame and embarrassment, and in order to conceal his feelings retired to a corner of the room.

"Do not let me disturb you, gentlemen," said M. Varanchau, coolly; "pray continue your game. Were you also playing, Severin?"

"No, Sir; I was only betting."

"That is nearly the same thing; gambling is a bad employment of time; but tell me, how is the sprain, which prevented your returning to Marseilles, and which has caused me so much uneasiness?"

"It is quite well now," said Severin; "and I intended to set out soon; but now, that you are come—"

"We will spend our vacation together," said M. Varanchau. "Gentlemen," added he, turning to the young men, who were still standing with the cards in their hands, and looking extremely confused; "do not disturb yourselves; pray continue your game—fifty francs on the table!—that is a large sum for young men who require, like Severin, to be economical in their pleasures in order to provide for their new-wives."

"I swear, father, it is seldom we ever play for so large a sum."

"Do not swear for such a little thing, my son; I would rather believe your word.—Gentlemen, will you honour us with your company to dinner?"

"Not to day, Sir," replied the boldest; "but we will accept with pleasure a bet our friend Severin owes us, but, now that you are come, we—"

"My arrival does not prevent my son's paying his debts," interrupted M. Varanchau: "honour compels us to owe no man anything."

The three gamblers made an insolent grimace, which M. Varanchau understood too well. The poor father was grieved to the heart, for he perceived his son had deceived him; but he was silent, and neither looked nor said anything.

"Sir, we thank you for your kind invitation," said one of the three friends, with such an ironical bend of his head that the colour rose to Severin's face; "Sir, we are obliged to you for it, but, on our word of honour, we cannot accept it. After dinner we were going to 'amuse' ourselves a little, but since you consider a game of cards too dear at fifty francs, your humble servants, Sir, with all our hearts:—farewell, Severin, we are going, but, as we pass, we will tell the cook that our dinner is to be sent back to the hotel." They left the room with a jeering and impertinent air, and singing loudly.

"Severin," said M. Varanchau, mildly, "it appears to me that you have very bad companions."

"Indeed, father, I assure you, they are very good,—a little rough in their manners, certainly,—but I do not like them the less for that."

"Severin," said his father, firmly, "I require the sacrifice of these friendships; I am more experienced than you, and I perceive your present companions will ruin you. Alas, how you are altered since you left Marseilles!—in what an occupation did I find you,—and who knows what else remains to be told?"

"Nothing, Sir; and, indeed, I cannot imagine why what you found us occupied with should so much astonish and grieve you; I am not worse than other young men of our acquaintance;—indeed, I am a very well behaved youth."

"I doubt it," said M. Varanchau, gravely.

"I work from morning till evening; I often study all night," replied Severin.

"God alone knows what study you are at,—perhaps gambling;—unfortunate young man!"

Severin did not reply to this; he feared at first the severe expression of countenance which accompanied his father's words; but, recovering himself, he took courage, and relying upon a tenderness which had never failed under any circumstances, he said, "Well! it is true; I have gambled, I have lost; so much the worse for me. But, do you imagine that one can live

in Paris on a thousand crowns a-year? I was obliged to have recourse to other resources for my support."

"That is dreadful, Severin!"

"At the end of four months I had spent all the money you gave me; I then gambled to gain more, to enable me to live in the same style I lived in at first."

"You tell falsehoods," interrupted M. Varanchau, as he looked scarchingly around him; "this room betrays poverty and disorder, both the consequences of gambling. Heaven be praised, that I came so soon!—Tomorrow I will pay all your debts, and the next day we shall set out for Marseilles."

This resolution was immediately executed. M. Varanchau assembled his son's creditors, and paid all his debts, amounting to ten thousand francs; which was the tenth of his fortune. This excellent parent then forgave his son, and brought him to Marseilles; but, alas! from this time Severin became sullen and discontented, and appeared always occupied with something which absorbed every thought. He studied at a Notary's, but he studied without inclination or any ambition to forward himself in his profession, but just as if he was fulfilling a task imposed upon him. Time passed thus for three years; at the end of this period M. Varanchau sent for him one day to come to the cottage;—the poor man never left his little retreat, for the coldness and undutiful behaviour of his son so wounded him, that he preferred leaving him to live alone in the town, than to endure his disrespect and want of affection. "Severin," said he, "I have something to propose to you; it is now time I should give you a certain honourable and lucrative situation; and, whatever sacrifice it may cost me, I am determined upon it.—Would you like to be a Notary?—would you wish to be married?"

At these words Severin's countenance brightened up, and he exclaimed, "I will do everything you desire!"

"Well," said M. Varanchau, "I have found an office and a wife for you, but one goes not without the other!"

"Very well, Sir; I accept them."

"At last he has come to his senses, and he will be happy!" thought his good father.

"At last I shall be master of my time, actions, and money!" thought the wicked son.

A month had scarcely passed away when Severin married his patron's daughter, and took possession of his office; he had not yet the title of Notary, being too young. M. Varanchau gave up almost the whole of his fortune to the young couple, and only reserved for his support an annuity of twelve hundred francs, the principal of which was lodged in his son's hands. Madame Lucie Varanchau was a gentle and sweet-tempered young woman, very well educated, but of a timid and retiring disposition; her husband ruled her at his will, made her submit to all his whims, and treated her as a child, whose actions, and even thoughts, he had a right to control. But, alas, the want of firmness in her character was one of the causes of their misfortunes. She never troubled herself as to her husband's pecuniary affairs; when she wanted money, she asked him for it, and waited patiently, sometimes for a month, before he gave it to her. She had no forethought, and, as their debts did not frighten her, she increased them without scruple, trusting to her husband to pay them sooner or later; and she always observed the most inviolable secrecy with regard to them. When her father-in-law, becoming uneasy at some reports, endeavoured to question her as to the truth of them, she always replied in an evasive manner, but calculated to remove his apprehensions. The patience she evinced, and which was carried too far, was what destroyed this poor young woman, whose conduct, in every other respect, was truly admirable. M. Varanchau now went to reside altogether at his cottage, accompanied by his old and faithful housekeeper, Madelaine, who had taken care of Severin from his birth, and who loved him with the warmest affection.

"My good master," said she one day on her return from town, "our Severin causes me much anxiety; I have just been at his house, and found him in low spirits, looking as pale as death, and in appearance, certainly, he had not passed last night at home."

"I fear he gambles," said M. Varanchau, mournfully; "and Lucie is so unsuspicious, she does not see the fearful abyss of sin and misery her husband is on the brink of. I am old, and I feel my days will be few on this earth; but she, poor young creature, what sorrow and trouble, and what a future is in store for her!"

"Nothing is wanting in her establishment," said Madelaine; "neither servants nor equipages, and they see much company."

"That is precisely what frightens me about them," said M. Varanchau; "where can Severin find resources to live in such style? I continually dread some catastrophe; for in these times riches do not flow so quickly. My son is I trust an honourable man; I do not apprehend he will sully his name and reputation by any of those nefarious practices which lead to disgrace and prison; but I fear he is on the road to ruin, the fatal consequence of his sinful propensity for gambling. Oh! if he but knew how his father's heart bleeds when he thinks of what awaits him!"

After this conversation, he went into his little garden; but his beautiful flowers had not the same charm for him they used to have in former days. He had a presentiment of some misfortune, and in the afternoon, when a carriage stopped at the gate, he could scarcely summon up courage to go and meet it, fearing it was his son. It was indeed he, but looking so pale and dejected, that Madelaine could not look at him without shedding tears.

(To be continued.)

ON THE TEMPERATURE OF THE BEEHIVE IN SUMMER.

In a former article¹ we considered the means employed by bees to keep out the winter's cold from their habitation, and the beautiful provisions of nature by which they escape being frozen to death; on the present occasion we propose to consider the means employed by these wonderful little insects for tempering the heats of summer, and ventilating their crowded abode.

In our own day the subject of ventilation has been very much discussed, and notwithstanding all the elaborate machines and contrivances which have been made for the purpose, it must be confessed that they have for the most part failed, and that we are nearly as far off as ever from a thorough practical knowledge of the subject.

And yet how simple is the proposition to let out the hot air vitiated by our lungs, and by our lamps and candles, and which rises as high as it can above our heads, and to provide for the reception of fresh supplies at a lower level! But there is scarcely a human hive in the kingdom where this is efficiently done, except in some of our large factories. No provision is made for the escape of the foul air, and we close our doors and windows as carefully as possible against the entrance of the fresh. Few persons are accustomed to trace to this prolific source the headaches and the fits of nervous irritability or depression to which they are subject. But such evils may be expected to continue until builders are taught to provide an exit for the foul air, as they are accustomed to do for the smoke of our fires.

If, with all our machines and contrivances, the ventilation of a house is difficult, how infinitely more so must

(1) See Vol. III., p. 281.

be that of a small hive, crowded with thirty or forty thousand bees full of life and activity, the greater part of the interior filled up with waxen cells, and only one small opening for the ingress and egress of the inhabitants, as well as for the escape of foul air and the entrance of fresh.

In a common hive there is absolutely no other door, or window, or opening than this small entrance hole; for on taking possession of a new hive the bees stop up all cracks and chinks with a resinous substance called *propolis*, for the purpose of keeping out insect and other depredators; and the proprietor, with the same object in view, generally plasters the hive to the stool; and, in order to shelter it from the rain, covers it with a heavy straw cap, or turns an old broken pan over it.

The reader is, of course, aware that the vital part of the air which we breathe is the oxygen, occupying only one-fifth of the whole of the atmosphere. The lungs as well as our lamps and fires convert this oxygen into carbonic acid, which supports neither life nor combustion. If we turn a glass over a lighted taper it is soon extinguished, and an animal similarly confined dies speedily.

But it may be said that insects are so different from other animals, that they may be shut up in a box and smothered, and yet be revived again; kept under water for hours, and yet be restored to life; kept without food for days and weeks, and yet not be starved to death. Much of this is true, for the vitality of insects is something very extraordinary; but still they are affected by the same agencies which affect us, and in a similar manner; they fall down apparently dead if shut up in a close vessel; they perish in gases which destroy ourselves; they perspire and faint with too much heat, and they are frozen to death with too great a degree of cold.

Huber introduced some bees into the receiver of an air-pump; they bore a considerable rarefaction of the air apparently uninjured, but on carrying it further they fell down motionless. They revived on exposure to the air, which would not have been the case with a warm-blooded animal.

In another experiment, three glass vessels, each capable of holding sixteen ounces of water, were taken. 250 worker bees were introduced into the first, the same number into the second, and 150 males into the third. The first and last were shut close, and the second only partially closed, so as to prevent the escape of the prisoners. In a quarter of an hour the workers in the close vessel became uneasy; they breathed with difficulty, perspired copiously, and licked the moisture from the sides of the vessel. In another quarter of an hour they fell down apparently dead. They revived, however, on exposure to the air. The males were affected more fatally, for none survived; but the bees in the vessel which admitted air did not suffer. On examining the air in the other vessels, the oxygen had disappeared, and other bees introduced into it perished immediately. On adding a little oxygen gas to it, other bees lived in it. They became instantly insensible on being plunged into carbonic acid gas, but revived on exposure to the air; they perished irrecoverably in nitrogen and hydrogen gases.

Similar experiments were performed on the eggs, the larvæ and the nymphs of bees, proving the conversion of oxygen into carbonic acid in all three states. The larvæ consumed more oxygen than the eggs, and less than the nymphs. Eggs put into foul air lost their vitality. Larvæ resisted the pernicious influence of carbonic acid better than the perfect insect would have done, but the nymphs died almost instantly.

The experiment above noticed of shutting up a few bees in a close vessel has also been performed on a whole hive. At a time when great activity prevailed, and the buzzing was audible at the distance of ten paces, Huber shut up the entrance at three o'clock on a rainy day, when all the bees of the hive were at home. "In a quarter of an hour," writes this distinguished

naturalist, "they began to testify some uneasiness, for, until that time, they seemed unconscious of their imprisonment. But their labours were now suspended, and the hive assumed quite a different aspect—all the bees, those covering the surface of the combs as well as those clustering together, quitted their stations and vibrated their wings in great agitation. This ferment continued about ten minutes, when the motion of the wings gradually relaxed and became less incessant. At thirty-seven minutes past three the workers had lost their strength—they could not cling by the legs, and speedily fell down. The numbers of falling bees kept on increasing until thousands strewed the board of the hive. Not one remained in the combs, and three minutes later the whole colony was suffocated. The hive cooled suddenly, the thermometer in it sinking from 95° to the temperature of the atmosphere. In hopes that the admission of purer air would restore heat and animation, we opened a stop-cock adapted to the hive, and also its entrance. The effects of the current introduced were unequivocal. In a few minutes the bees were in a condition to respire, the rings of the abdomen began to play, the vibration of their wings commenced simultaneously—a very remarkable fact, which we had previously noticed at the moment privation of the external air had been felt. The bees in a short time reascended their combs, the temperature rose to the degree which these insects know how to preserve habitually, and in a few hours order was established in their dwelling."

These experiments sufficiently prove that bees require constant supplies of fresh air, much in the same manner as do all other animals. They also require their dwelling to be kept moderately cool. When, from any circumstance, such as exposure to the sun, over-crowding, or the excitement produced by fear, anger, or preparations for swarming, the temperature of the hive is greatly raised, the bees evidently suffer; they often perspire so copiously as to be drenched with moisture, and on fine summer nights thousands of them will hang out in festoons and clusters to relieve the crowded state of the hive. In one of Reaumur's hives, which contained a small swarm, the temperature greatly exceeded that of the hottest days of summer; and when the bees were excited, one of the panes of glass in the side of the hive would feel, to a hand placed near it, as if it had been held near a fierce fire; and the heat has been known to soften the wax of the combs and to cause them to fall.

In inquiring into the method adopted by the bees for renewing the air of the hive, Huber was struck with the constant appearance of a number of the workers arranged on each side of the entrance-hole, a little within the hive, constantly engaged in vibrating their wings. In order to see what effect a similar fanning would produce upon the air of a glass receiver containing a lighted taper, M. Senebier advised him to construct a little artificial ventilator, consisting of eighteen tin vanes. This was put into a box, on the top of which was adapted a large cylindrical vessel of the capacity of more than three thousand square inches. A lighted taper contained in this vessel was extinguished in eight minutes, but, on restoring the air, and setting the ventilator in motion, the taper burnt brilliantly with undiminished light, and continued to do so as long as the vanes were kept moving. On holding small pieces of paper suspended from threads before the aperture, the existence of two currents of air became evident; there was a current of hot air rushing out, and at the same time a current of cold air passing in. On holding little bits of paper or cotton near the hole of the hive, similar effects were produced: they were impelled towards the entrance by the ingoing current, and, the moment after encountering the outgoing current, were repelled with equal rapidity.

The method, then, by which the bees act these two currents in motion is with their wings. The workers only fill the office of ventilators, and the number varies from eight or ten to twenty or thirty, according to the state of the hive and the heat of the weather. It is

interesting to watch these persevering little fanners, as the writer has frequently done. They station themselves in files near the entrance of the hive, with their heads towards the entrance, while another and a larger party stand a considerable way within the hive, with their heads also towards the entrance. They plant their feet and claws as firmly as possible on the place they occupy, the first pair of legs being stretched out before, the second pair extended to the right and left, whilst the third, placed near together, are kept perpendicular to the abdomen, so as to give that part considerable elevation. Then uniting the two wings of each side by means of the small marginal hooks with which they are provided, so as to make them present as large a surface as possible to the air, they vibrate them with such rapidity that they become almost invisible. The two sets of ventilators standing with their heads opposed to each other thus produce a complete circulation of the air of the hive, and keep down the temperature to that point which is fitted to the nature of the animal. When a higher temperature is required at one particular spot, as, for example, on the combs containing the young brood, the nurse-bees place themselves over the cells, and, by increasing the rapidity of their respirations, produce a large amount of animal heat just where it is wanted.

The laborious task of ventilating the hive is seldom or never intermitted, in the common form of hive, either by day or night during summer. There are distinct gangs of ventilators, each gang being on duty for about half an hour. In winter, when the bees are quiet, and their respiration only just sufficient to maintain vitality, of course no ventilation is carried on, but, by gently tapping on the hive, its inmates wake up, increase their respirations, and consequently the temperature of the hive to such a degree that the air becomes intolerably hot and vitiated. To remedy this a number of worker-bees immediately come to the entrance of the hive, and begin to ventilate the interior as laboriously as in the summer, although the open air be too cold for them to venture abroad.

In some of the larger and improved forms of hive the necessity for ventilation is not so urgent; but Huber remarked that the bees began to fan the air as soon as the sun was allowed to shine into a glass hive by removing the shelter. By similar means bees endeavour to get rid of noxious odours. Huber says, "Having separated some bees from their hive by the attraction of honey, we brought cotton, dipped in spirit of wine, near the head. Its effect could not be mistaken—they dispersed, agitating their wings, and then drew together again to resume their repast. When completely engaged the experiment was repeated, and they dispersed anew, but without retracting the proboscis entirely—they were satisfied with vibrating the wings, and continued feeding: when too much affected by disagreeable sensations, they precipitately withdrew and took to flight. Frequently a bee turned away from the honey and began to fan itself, until the sensation or its cause were by this means abated, and then returned to feed.

"Such experiments are never more successful than at the entrance of the hive; because the bees, retained by the united attraction of honey and their home, are less disposed to retreat from external impressions. Humble bees adopt the same method of dispelling pernicious odours. But what is very remarkable, and may partly show the importance of vibrating their wings, neither their males, nor those of domestic bees, though very sensible of similar sensations, know how to protect themselves, like the workers, against them. Ventilation is therefore one of the industrial operations peculiar to the workers.

"The Author of Nature in assigning a dwelling to these insects where the air can hardly penetrate, bestows the means of averting the fatal effects which might result from the vitiation of their atmosphere.

Perhaps the bee is the only creature entrusted with an important function, and which indicates such delicacy in its organization."

It appears from the beautiful experiments of Mr. Newport, noticed in the former article, that bees in general maintain a temperature of 10° or 15° above that of the medium in which they live; but that at certain periods this temperature is greatly increased. In the month of June when the atmosphere was at 56° or 58°, the temperature of the hive was 96° or 98°. This high temperature arose from the nurse-bees incubating on the combs, and voluntarily increasing their heat by means of respiration before the new bees come forth.

C. T.

RAMBLES IN BELGIUM.

No. IX.—MALINES.

THERE was a tremendous stir and excitement at the station at Malines, when I got out of the railway carriage at that great central point of all the Belgian railroads. A train from Ostend had met with an accident, and, no particulars having arrived, there were a great many individuals, friends of expected passengers, in a state of feverish uncertainty and suspense: I became so interested in the probable fate of these parties, that I waited to hear the result. In about an hour the train itself appeared; and, much to the joy and satisfaction of all present, it became speedily known that no lives were lost, and that no one had received any very serious injury. To listen, then, to the cordial greetings and the exclamations poured forth by German, Belgian, French, Dutch, and English tongues, was truly entertaining. "All's well that ends well," was the prevailing sentiment, and one in which I heartily united as I left the station, and made my *entrée* through the new gilt gate into the quiet town of Malines.

My attention was immediately awakened to the antiquity of the surrounding streets and houses: the latter are very large, and are adorned in the veritable Flemish style. Some of the ornaments are excessively rich, and the points and gables are decorated in the most florid manner. It seemed, at first sight, that a hundred histories were attached to a particularly antique looking house, when anon, another appeared in a neighbouring street as quaint and fanciful, and then going further and further on, others of the same character were seen in every part of the town; and when at night I indulged in a reverie and promenade, the effect of all these was extremely picturesque and beautiful, especially as the moon, just then at the full, gave her softened lustre, and imparted a silvery tint that completed the perfect charm of the *ensemble*. It needed very little effort of the imagination to fancy many a passer by and many a group lingering to have yet another word, actors in the scenes that Froissart and Philip de Comines depicted with so much fidelity. The garments of the peasantry add greatly to the *mise en scene*, and, above all, the moon shining so steadily. Whoever wishes to see the architectural beauties of Belgium in their best aspect, should certainly select moonlight nights during his rambles, in order to enjoy the fantastic appearances that will be found wherever he moves. A great many English families were residing here, probably partly for quiet's sake, partly for economy, as living in this out-of-the-way town is very moderate, house rent reasonable, provisions cheap, and luxuries attainable. It is also conveniently situated within an easy distance of Brussels, and not a long journey from the coast. It is called Malines and Mechlin; under this latter designation it is well known to most of the fair sex from its lace, which, though of coarser quality than the famous Brussels' variety, is yet very celebrated and much admired.

The host of the hotel, La Grue, accompanied me a short distance down the street to the left of the Grande Place, in order to show me the cathedral: on our way,

we passed through a line of stalls and booths, and I found that it was the Malines' Fair. There were a great number of stalls for the sale of cakes, fruit, and light fancy articles, and one which not a little astonished me, a book-stall. The books were of very various nature and age, some of the cheap light books of the day, some few dark-looking volumes, which would have delighted the heart of a bibliophile to look at; in fact, all sorts were here to be met with. Malines is the Canterbury of Belgium, being the see of the primate; he has a residence not far from the cathedral, which is a quiet, respectable-looking edifice.

The cathedral is very ancient, and is remarkable as possessing a lofty tower of immense height. The architecture is evidently of the Moresco style; on the outside is a clock-dial, the numbers on which are so large, that in the strong moonlight the citizens can tell the hour. The effect of the moon's rays through the open Gothic work of the summit of this tower is beautiful. On the pavement is a circle of stones of the same size and dimensions as the clock above. The interior of the building contains a picture, in the very best manner of his most finished style, by Vandyke. The subject is the Crucifixion. The vigour and attention to detail in this work are most extraordinary. Some of the figures are in themselves exquisite studies. The weeping Magdalen is perfect; it is the very portrait of that devoted woman, who is here represented at the foot of the Cross. No idealist, however highly he may have formed his image of that lovely follower of divine faith, will be disappointed when he sees her on this glowing canvas. There was so much to notice in this celebrated painting, that I did not allow myself on this occasion sufficient time to judge of the merits of several others which were on the adjoining walls. Subsequent visits, however, did not detain me by their side, for I invariably left all to enjoy again and again the real gem of the whole collection. Every time I saw this one, I found some new beauty to admire, something too that bore minute inspection, and yet held out promise of more enjoyment for another day. It would seem to be an acknowledged verity, that the subject of which this painting is the representation, is one which stimulates the artist to all that is in him of genius and talent. So should it be, in the hour of that solemn agony, there speaks a voice lofty and prompting to the heart of the true worker in the province of high art. It is impulsive rather than suggestive. It is a subject which can never tire; and the more often we behold it with true devotional feelings, and with a thorough consciousness of its sublimity and grandeur, the more open will our hearts, sated with the petty vexations and wearisome trials of this world of woes and griefs, become softened and toned down to the endurance of our own lot. With respect to this particular artist, Vandyke, I can safely say, until this period of my life I never knew of what high conceptions he was gifted with. In England there are so few of his sacred compositions, that I was continually surprised with the beauties I met with in the different churches throughout Flanders. My whole thoughts when in this cathedral were so constantly absorbed by repeated gazings on the Crucifixion, that, although I entered the holy walls seven or eight times during my stay at Malines, I did not give more than five minutes' attention to the wondrous carved pulpit, which some connoisseurs reckon the finest in Europe. It represents the Conversion of St. Paul, and occupies a large space in the body of the cathedral. On my last visit, the sacristan led me to a monument in the wall of the choir. It is the family memorial of the house of Bartholdi. There is this inscription on it:—

"TRIUM BERTHOLDORUM,
QUI SEculo DECIMO TERTIO MECHANICE DOMINABUNT HIC
ULTIMA DOMUS."

I had a great wish to see the botanical garden, and found there was no difficulty in doing so. It is prettily

laid out, but the grass plot was at once an offence to my English eyes, accustomed to the neat lawns of the gardens of trim English gardeners. It was innocent of any scythe or broom, and would most likely so continue to be till the great mighty Time, with his ever-moving power, should mow away grass, garden, and all fair things beside, into the regions of Eternity. The good people who had charge of these public gardens did not seem to have any idea of their deficiencies in this matter and could not understand why the English should so elip the luxuriant growth of nature, as to have their lawns mown once or twice a week.

The conservatory was kept in very good condition, and had some very fair specimens of the Orchidaceæ tribe. In it also I beheld a novelty in the shape of some heliotropes and sweet-scented yellow-jasmines trained in the same way, and to the same height as our standard roses. The appearance was not only novel, but very pleasing.

After leaving the gardens, I met a friend who was on his way home from Munich; I was persuaded by him to play a game at billiards, and accompanied him therefore to a room set apart for the purpose; the balls were very large, and the game is different from ours, for the art consists in avoiding knocking the ball into the pockets. The table was a small one. Our stay was short, but it was an amusement for an idle half hour, which served to show one how these things are done in Flanders. On our way to join the *table d'hôte*, we met a great man's funeral; he had been the grand seigneur of an adjoining village, and was being taken to his last earthly resting-place in all the consequence of pomp. There was a great quantity of priests in the rear, one of whom had a velvet mantle covered with emblems of mortality, which had a lugubrious effect in the warm sunshine. The streets of Malines are particularly clean, and are free from any annoying nuisances.

The sabots are much worn by the lower orders who clatter along the quiet places, with very certain testimony of their whereabouts. At the market I saw some boys, who at the end of a long string had fastened each a bird; one of these unfortunates was a quail; they were all to be disposed of, but I did not remain to witness any of these commercial transactions. The vegetables and fruit exposed for sale were remarkably fine and very cheap; the pears were in excellent order, very large, sweet, and in great variety. There is a custom I observed in many of the gardens, both here and in many other places in Belgium, of training the pear trees as the elms are done in the vicinity of London; that is to say, all the lower branches are lopped off, and the tree is made to grow in a sort of bush at the top. In all probability, this is designed to cause the tree to produce a greater abundance of fine fruit.

The church at Notre Dame contains a picture by Rubens, which having been strongly recommended to my notice, I took an early opportunity of going to see it. It is placed on the back of the altar; the colours are very fresh, and the picture is in good preservation. It originally consisted of eight distinct groups, all having reference to the main subject—"The Miraculous Draught of Fishes;" but the whole having been carried off to Paris, only five were subsequently restored; consequently, in its present state it is imperfect. One of the vultures has a figure of Tobias, drawn in the most masterly manner, and in colouring equal to many of the productions of Titian. The walls of this church were hung with black drapery, on which skulls and thigh bones were worked in white. Very dismal and very suggestive of all sad things. It was here where the lord of the manor, whose funeral I passed the previous day, was buried. The character of this edifice is essentially Gothic, and has no mixture in any of its parts; so that these funeral equipments appeared the very climax of woe's despondency.

The church of St. Jean, possessing an altar-piece, also by Rubens, and, indeed, considered by him as his best production, claimed my attention; and after having

some trouble in finding out the functionary who held the keys, I stood before "the Adoration of the Magi." I must confess that I give the preference to the painting at the church of Notre Dame. Either the canvas has been injured by cleanings or repairs, or else the colours having been laid on thickly, have given way, and thus deteriorated the general effect. The receipt in the handwriting of the great artist is carefully preserved by the custos. It is written in a good manly hand, and is signed Peter Paul Rubens. He was paid 1,800 florins, and began and finished the painting and volets in eighteen days.

It was impossible to resist the invitation of my landlady, who procured me an introduction to a pleasant picnic party, who allowed me to accompany them to Steen, where I saw the château occupied by Rubens, and from thence to Perck where Teniers resided, and where there is a picture of his which, however, I did not see. It was with much regret that I bade Malines adieu; not the least charm which the town has is its carillons, that so agreeably wait upon the ear with dulcet harmonies. They consist of a chime set in motion by machinery, and connected to which are very many stops. Of an evening by the side of the river, the carillons were welcome harbingers of the night's arrival.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

A CHILD'S LAMENT,

ON THE UNEXPECTED DEATH OF A FAVOURITE BIRD.

Written for, and at the request of, my little Son,

BY THE REV. HOWELL PHILLIPS.

It was a little wayward thing,
With crimson head and golden wing,
The bird that died to-day:
It hopped and chirruped in its cage,
Buoyant, as though it knew not age,
And spent its life in play.

But Death, whose noiseless, viewless hand
Can man and beast alike command,
Unkindly struck my bird:
No outward sign of sickness gave
A token of a speedy grave,
It died unseen, unheard.

The day of health, the peaceful sleep,
With head beneath its wing—O! weep!
When morning ope'd her eye,
Revealed my darling dead and cold,
It's perch relinquished, and it's hold
Of life as easily!

I loved the bird—my mother dear
Loved it's sweet note, so soft and clear,
And cherished—fed it, too:
And, as she feeds and fondles me,
I, too, must weep, my bird, for thee,
For grief, where love, is due.

Miscellaneous.

MODE OF BREEDING LEECHES IN SCONDE.

THE breeding of leeches, even in Europe, is kept a secret, so far as anything can be in that quarter of the world. The breeding of them was at one period almost entirely confined to a tribe of gipsies, but the secret got known and went abroad. In Great Britain, even to

this day, the best description of leeches is procured from the Continent. In Ceylon, where the variety of leeches is more numerous perhaps than in any part of the world, the propagation of the sort used in phlebotomy is made a secret of. In India the leech propagators do all they can to keep the knowledge to themselves. This has not, however, prevented one of our most accomplished naturalists and botanists from propagating these valuable reptiles with the greatest success; so much so, indeed, as to be a great saving to Government in furnishing the hospitals. Major Blenkins is the gentleman to whom we allude, and to whom we take this opportunity of returning thanks for the perusal of his curious and very interesting paper on this subject. Burnt earthen vessels, commonly called "cottee pots," are used for this purpose, of globular shape or form, being three feet in circumference, one ditto in height, and with mouth six inches in diameter, each pot being two-thirds filled with stiff black earth, containing a good portion of clay. To this add four handfuls of finely-powdered dry goat or cow dung, two handfuls of dried hemp leaves, finely powdered, with two ounces of assafetida. The vessel is then filled to within three inches of the mouth with water, and the whole mixed up with a wand or stick. Leeches of full growth and of the largest size are required for propagation, varying, perhaps, from three to five inches in length, after being placed on and glutted from the human body. The leeches are put, nineteen or twenty, into each vessel; an earthen cover is then placed over the mouth, and the whole smeared over with a coating of cow-dung and earth, and placed in a sheltered spot, free from wind and sun. After the space of twenty-five days or a month, on the cover being moved off, about twenty cocoons will be found of the size of the sparrow's egg, and longer, and of a spongy nature. On being carefully torn open with the finger, from five to fifteen small leeches will emerge. All of these are then placed in a pot of water, into which a table-spoonful of sugar has been thrown. After ten days it is requisite to feed them with blood from the human body for a period of three months, when they will have attained the usual size for application. During the warm months, after a respite of ten days or so, the breeding leeches can again be placed as above described. The leech appears to live about eighteen months, and any number can be procured in this way.—*Colonial Magazine.*

LIFE is to us all like a succession of shower-baths. Some shiver and tremble, and holding in their hands the fatal string, look round for a means of escape, and give a slight pull, and feel the first misery of the shock, and then in fear give way, and shiver, and look, and gently pull again, and at last leave the scene of their trial, chilled and comfortless, and uninigorated: and others rouse up their energies to face the seeming suffering, and after the first alarm is over, find that they have attained a lasting good at the expense of a momentary evil, for good that must be which, at whatever price, strengthens our powers of self-command, and gives us moral courage.—*Margaret Percival.*

CORIDON, PASTORELLA, AND CALIDORE.¹

"And ever when he came in companie
Where Calidore was present, he would loure
And byte his lip, and even for jealousy
Was readie oft his owne hart to devoure,
Impatient of any paramour."

Spencer's Faerie Queene, Book VI. Canto 9.

THE CLOTHES-MOTH.

Few sounds are more terrible to the housewife's ears than the name of the *clothes-moth*; and yet, if any of our fair readers will take the trouble to peruse the following details, they will perhaps feel a new interest in the object of their aversion, and gain a hint or two as to the best methods of dealing with this insidious foe to the integrity of our blankets and woollen garments as well as costly furs.

But, after all, it is not the *clothes-moth* that does the mischief; she merely lays the eggs, which in due time are hatched into maggots or caterpillars, seldom so much as half an inch in length, but furnished with a pair of admirable mandibles, with which they shear the nap from woollen and hairy fabrics, not certainly from mere love of mischief, but from the very same motive which prompts most of us to active exertion, namely, for the sake of food and clothing; for our *clothes-maggot* feeds upon woollen fibres, makes a jaunty cloak of the same to cover his body, and lines it daintily with silk, lest it should press too roughly against his delicate white skin.

But still you will say, fair reader, it *is* the *clothes-moth*, after all, that is the *parent* of all the mischief. Well! be it so—It was only last night that we heard a cry of terror in our bed-room, and the terrific monster which caused it was brought to us for inspection. It was a poor little *clothes-moth* that had hidden itself all day, and had just come out to take a little air in the refreshing darkness of the night (for the *clothes-moth* is a nocturnal insect, and cannot endure the light of day), when being dazzled and blinded by the candle, it rushed forward, (probably to put it out, but this we don't know,) and was caught. The four wings which cover the insect appear to be little more than a mass of silky powder, and so fragile and delicate a thing is it that a touch suffices to destroy it.

From the middle of spring until near midsummer, these moths may be seen flying about after sunset, in search of proper places for depositing their eggs. In order to ascertain the history of this insect, our favourite Réaumur inclosed a number of the moths in small bottles containing morsels of woollen cloth and stuff. The eggs laid were so small as scarcely to be visible; they were hatched in about three weeks, and the tiny grubs immediately began in the naturalist's bottles that work of havoc which is usually carried on in our drawers. They first begin to provide themselves with cloaks, and, in doing this, they exhibit from their very birth that wonderful skill which is well calculated to engage our attention. *Ce que la nature apprend est seu de bonne heure.* At first the grubs can only be examined by means of a magnifying glass, and they are therefore seen to most advantage at a more advanced age. The cloak or sheath which it forms soon after birth, is a sort of tissue of wool, the colour of which, of course, depends upon that of the stuff attacked. Sometimes it assumes a very harlequin appearance from being composed of bands of different colours, as the taste of the insect has led it to attack cloth dyed blue, green, red, gray, &c. The insect moves upon six scaly legs, situated near the head, which are protruded for the purposes of locomotion, the sheath being dragged along after the

animal, and held in its place by the membranous legs situated nearer the other extremity.

As caterpillars increase very rapidly in size, the *clothes-grub* soon outgrows its cloak. What does it do then? does it take measure for a new one, or does it enlarge the old one? Part of its daily occupation is to lengthen it, which the ingenious insect does in the following manner. Putting its head out at one end, it seeks about for woollen filaments of the proper size: if those close at hand do not suit its purpose, it extends its body often as much as half out of the sheath in search of better ones. Having found one to his mind, the insect seizes it with the mandibles, and by repeated efforts tears it out of the fabric, and attaches it to the end of the sheath; this is repeated many times. The operation is one of cutting as well as tearing, and for this the mandibles are well adapted, consisting as they do of scaly plates, similar to scissors, and terminating in a point.

But it is necessary to increase the length of the sheath at both ends. How is this to be done? While M. Réaumur was watching an insect which had been working at one end of the sheath, what was his surprise to see a head emerge from the other end! "Can the insect have two heads?" thought he, "or is the extremity of its tail formed like a head?" On continuing to watch, there was no doubt that it was a head, and it soon appeared that the insect has the power of turning in its sheath, so as to put out its head at either end; and this it does with so much rapidity that there scarcely seems time for a manœuvre of such apparent difficulty.

In order to see how the insect turns in its case, M. Réaumur cut a piece off the end of its sheath, so as to leave only about a third of the body covered. The insect immediately set to work to repair the damage, and did as much work in twenty-four hours as it would otherwise have done in a month. In turning, the insect bent itself double, the folded part projecting for a moment out of the sheath, and occupying what would be in the whole sheath the middle or widest part.

But, as the caterpillar increases in diameter as well as in length, its sheath soon becomes too narrow for its body. The silk-worm and other caterpillars change their skin when it becomes too tight for them; does the *clothes-moth* caterpillar change its sheath in a similar way? or does its increasing size distend the sheath so as to accommodate it to its body? The insect adopts a far more ingenious and efficient plan: it does exactly what a skillful tailor would do under similar circumstances; it splits open the sheath, and lets in a new piece of the required size; but, in order that its body may not be exposed while it is at work, it actually lets in four separate pieces, two on each side, so that it is never necessary for the grub to cut open more than a single slit, extending half way along one side of the sheath.

In order to watch these proceedings with facility, Réaumur placed some grubs whose sheaths were of a single colour, upon cloths of a different colour, such as blue upon red, red upon green, &c. The bands of different colours which appeared across the sheath, showed the periodical lengthenings, while those bands which extended in a right line from one end to the other, showed the increase in width.

In cutting open the sheath, the grub begins in the middle, and extends the slit to the extremity, using its mandibles for the purpose, which make as clean a cut as the best scissors would do. When one slit is thus filled in, another is made and filled in like manner; then turning in its sheath, the grub proceeds to enlarge the other half of the case. About two hours are occupied in making one cut, and the wool is filled in in the course of the next day.

It was stated above that the insect lines its sheath with silk. In common with most caterpillars, the *clothes-moth* caterpillar secretes a quantity of silk, which it spins into delicate threads, strong enough, however, to suspend it in the air. With this silky

(1) See Engraving on preceding page.

thread the insect ties together the different filaments of wool which compose the sheath, forming, as it were, a kind of tissue, of which the warp is of wool, and the weft of silk. This tissue is very firm in texture, for the silk of caterpillars when drawn out is covered with an adhesive gum, which dries in the air, and serves to bind the substances to which it is attached still more closely together. While weaving the filaments of wool, the insect carries the silken thread to the interior, where it completes the lining. The spinning-tube below its mouth is the shuttle, and the grub may be seen moving its head from one side to the other with great rapidity.

Whether the insect begins its sheath with pure silk, or with a mixture of wool and silk, cannot be determined by ordinary observation; but all its proceedings become apparent by stripping the insect, and compelling it, as it were, to make a new cloak. M. Réaumur introduced into the end of several sheaths a small twig, and by pushing it forward gradually drove the insects out. They seem never to have thought of getting back into the old sheath, which was left near, but set to work to weave new ones; sometimes the naked insect would remain uneasy and restless for half a day, as if uncertain what to do, but eventually they all began by weaving a silken envelope, which was finished in one night; then the woolly sheath was formed, and completed in five or six days, although the old one had been several months in progress.

The young grubs work in the same manner; they first make a vest of pure silk, they then attach to the central part of this a ring of little filaments of wool, parallel to each other, and inclined gently to the length of the sheath; a second ring is added, close to and partly supported by the first; then a third, and so on; but in lengthening the sheath they first lay a foundation of silk, upon which the woollen filaments are afterwards tied.

The sheath formed by the newly hatched grubs, small as it is, is much too large for the insect's body, as if the grub wished to spare itself, for some time, the trouble of enlarging it. In this state they do not retain a firm hold of the sheath, for on shaking a piece of cloth covered with young grubs over another piece of cloth, the naked insects will frequently fall down, leaving the sheaths behind them.

At certain periods the insects remain inactive; this is always the case in winter, and for short seasons in summer and autumn. At such times they fasten the sheaths securely to the cloth on which they have been pasturing, by means of their silken cables, and no shaking of the cloth will detach them.

However singular it may appear that the stomachs of these grubs can digest woolly fibres, it is not less remarkable that the dye stuffs with which these fibres are coloured, pass through their bodies unaltered: hence, Réaumur has suggested that water colours of beautiful tints, not otherwise easily attainable, might be procured by feeding the grub on different coloured wools.

When the grubs have attained their full growth, and the time of their metamorphosis is at hand, they sometimes abandon the stuffs which have hitherto furnished them with food and clothing, and seek out places capable of affording more fixed supports, such as the corners of drawers, walls, &c. They then hang up their sheath, with silken threads, by one or both ends, at various angles between a horizontal and a vertical position, and close with silk both ends of the sheath. They soon change into the chrysalis, which is at first of a yellowish tint, but passes into reddish. In two or three weeks the perfect moth is formed; she pierces the end of the sheath, and, after a few struggles, escapes into the air, and prepares to lay her eggs, from which a new generation of grubs will in due time be hatched.

The fur-moth does not greatly differ from the wool-moth. The grub constructs its sheath in a similar manner, the only difference being in the nature of the

material. It is not easy to see these grubs at work, because they attach themselves to the surface of the skin, and are entirely concealed by the hairs. The insect seems to take a pleasure in cutting off these hairs, for those necessary for its wants are as nothing compared with the immense quantity which falls from a skin on slightly shaking it. A razor could not shave off the hairs so completely or so well.

It appears exceedingly probable that the wool-moth and the fur-moth belong to the same species. Réaumur has taken the young grubs from fur and put them upon wool, and they continued to live and thrive, and they passed through their changes like the other grubs. He has transplanted them from wool to fur with equal success. The grubs are not at all nice as to the kind of skin they are put upon; for they seem to pasture equally well upon a horse's hide as upon the most delicate fur. They will even feed upon butterflies' wings, as Réaumur proved.

M. Réaumur has devoted a separate and very elaborate memoir to an inquiry into the best method of getting rid of the clothes moth; from this we select a few of the most important details. Let us first notice a few superstitions connected with the subject.

According to Pliny a dress which has been used to cover a coffin is for ever after safe from the attacks of the grub. Iasis says that cantharides suspended in a house will drive them away, and that clothes wrapped up in a lion's skin are safe. Other writers recommend various vegetable substances, such as saline, myrtle, peppermint, iris, lemon-peel, anise, &c. Caton recommends a preparation of olives for rubbing over the interior of drawers.

With the exception of the coffin and the lion-skin, Réaumur tried the other substances, and a variety of others; none proved injurious to the grubs, and some of the most noted preservatives even seemed to make the insects thrive. They were not affected when shut up with pieces of cloth which had been steeped in vinegar, infusion of peppermint, sea salt, soda, &c.; they thrived admirably with iris-root, and were not at all injured by cantharides shut up with them in a bottle.

Although the grubs attack woollen fabrics of all colours, they are not altogether indifferent as to the texture; they prefer loose textures to close ones, because in the one case the fibres are more easily torn out. On this account they prefer the nap of the cloth, because it is so easily got at, and they do not attack the thread until the nap is removed. The more the yarn of the woven material is twisted, and the more perfectly the cloth has been fulled, the less is it exposed to their attacks. Some of the old tapestries remain entire, because they are made of hard-spun yarn, while modern tapestries of loose texture are destroyed in a few years. Thus the tapestries of Auvergne are much more liable to be attacked than those of Flanders; and the serge, once so extensively employed in the houses of France, has been almost entirely given up, on account of its liability to the attacks of this grub. Backs of chairs are now covered with leather, or some such material; so that it is an actual fact that the textile manufactures of France have suffered from the attacks of an apparently insignificant little insect. Felted goods are but little attacked, on account of the interlacing of the fibres rendering it difficult to separate them.

"But is there no remedy against the attacks of the clothes moth grub?" will the fair reader exclaim, who has had the patience to accompany us thus far. She will probably suspect the writer of being so captivated with the ingenuity of these silk-lined-woollen-cloak gentry, that he seeks to conceal the instrument of their destruction. But what will you say, fair reader, to asking your husband to smoke his evening's cigar in the bed-room, instead of in the garden? Or would you object to the risk of being suffocated with the fumes of burning sulphur? These are remedies, it is true; but perhaps you will agree that they are worse than

the disease. Let us then try some more practicable plan.

It is usual every year with good housewives to turn out and dust their wardrobes and drawers, and to shake and brush their contents. This is an excellent preservative, if done about the time when the young grubs are hatched, which is during August and September. At this time they can be shaken off the cloth with a very little force; but at other times, when they anchor their sheaths to the cloth with silken cables, it is not so easy to get rid of them.

It may, perhaps, strike many persons as remarkable, that the wool on the sheep's back is not liable to the attacks of the clothes-moth grub. In fact they do not attack the wool until the yolk or natural grease of the fleece is got rid of, and the more perfectly cloth is scoured, the better is it suited to the palates of these creatures. Some oils, however, such as nut oil, suit their taste. This remedy, however, is not to be thought of, for no one would like to have his clothes greasy for the sake of keeping away the moth. It is astonishing, however, how slight an application of grease is effectual as a preservative; merely passing a piece of undressed wool over some serge was found sufficient to preserve it. An infusion of tobacco, of pepper, of soda, and of olive oil had the same effect. And it is curious to notice the behaviour of the insect when shut up with this unpalatable food. Well may Réaumur exclaim, "*Je ne connoissais pas encore tout leur génie quand j'ai cherché à devenir leur destructeur.*" Under such circumstances the grubs adopt the same plan as some of our arctic voyagers have done to allay the pangs of hunger: they eat their kid gloves and leathern breeches; the caterpillar, however, eats his woollen cloak or portions thereof, and supplies its place with the little dry round grains of excrement, which as before noticed retain the colour of the wool which has been digested; these grains are united with silken threads, and serve to keep the insect covered, which is essential to its well-being.

It is an old custom with some housewives to throw into their drawers every year a number of fir cones, under the idea that their strong resinous smell might keep away the moth. Now, as the odour of these cones is due to turpentine, it occurred to Réaumur to try the effect of this volatile liquid. He rubbed one side of a piece of cloth with turpentine, and put some grubs on the other: the next morning they were all dead, and, strange to say, had voluntarily abandoned their sheaths. On smearing some paper slightly with the oil, and putting this into a bottle with some grubs, the weakest were immediately killed; the most vigorous struggled violently for two or three hours, quitted their sheaths, and died in convulsions.

It was soon abundantly evident that the vapour of oil or spirits of turpentine acts as a terrible poison to the grubs. Perhaps it may be said that even this remedy is worse than the disease; but, as Réaumur justly observes, we keep away from a newly-painted room, or leave off for a few days a coat from which stains have been removed by turpentine, why therefore can we not once a year keep away for a day or two from rooms that have been fumigated with turpentine. It is, however, surprising how small a quantity of turpentine is required: a small piece of paper or linen just moistened therewith, and put into the wardrobe or drawers for a single day two or three times a year is a sufficient preservative against moth. A small quantity of turpentine dissolved in a little spirits of wine (the vapour of which is also fatal to the moth) will entirely remove the offensive odour, and yet be a sufficient preservative.

The fumes of burning paper, wool, linen, feathers, and of leather, are also effectual, for the insects perish in any thick smoke; but the most effectual smoke is that of tobacco. A coat smelling but slightly of tobacco is sufficient to preserve a whole drawer. We trust our fair readers will not scold us for thus affording

their husbands or lovers an additional excuse for perpetuating a bad habit.

The vapour of turpentine, and the smoke of tobacco, are also effectual in driving away flies, spiders, ants, earwigs, bugs, and fleas. The latter torments are so abundant on the continent, as frequently to deprive the weary traveller of his night's rest. If he would provide himself with a phial containing turpentine and spirits of wine in equal parts, and would sprinkle a few drops over the sheets and coverlid before retiring to rest, he will probably have reason to be grateful for the hint. Foreigners are in the habit of smoking in their bed-rooms—a habit which excites surprise and disgust in England; it will now be seen, however, that there is a reason for the practice.

In concluding this long article we may sum up the whole with a short word of advice, in the form of a household recipe.

TO KEEP AWAY THE MOTH.

Before folding up and putting away your winter blankets, furs, and other articles, sprinkle them, or smear them over with a few drops of oil of turpentine, either alone or mixed with an equal bulk of spirits of wine. No stain will be left, and if spirits of wine be used, the odour is not disagreeable. C. T.

THE LIVING AND THE DEAD.

AN IRISH SKETCH.

By MRS. HOARE.

It is common with other imaginative and half-civilized people, the lower orders of Irish have many wild superstitions connected with death. Not a mere cold belief, but a firm and lively faith in the existence of "a world beyond the grave," fills their minds with a vivid conviction that their departed friends are with them and around them still. "Not lost, but gone before," is a truth ever present to the warm-hearted Irishman; he continues to associate his buried ones in all the cares and pleasures of existence, and that in an every-day and lifelike manner, which would often border on the ludicrous, did not the wild pathos, the genuine poetry, that clothe the expression of his mourning, seem fully to redeem it from any touch of vulgar association.

The little damsel who, in Wordsworth's touching ballad, so repeatedly asserted "We are seven," ought to have been a native of our Green Isle; for there many a childish heart holds the loving faith that cheered that little churchyard lingerer. The anxious care also bestowed by the very poorest peasant on the obsequies of his relative, shows that he believes the latter still cognizant of his actions: all business, however important, is postponed, whenever any funeral within a circuit of several miles is to be attended. To have "a decent berrin, and all the neighbours at it," is the grand object of an Irishman's solicitude, when he feels his end approaching. Many an old *bocough*, the sum total of whose worldly possessions is borne on his back, and, being the tattered remnants of "Irish old clothes," would probably not fetch a silver sixpence at the rag-dealers, has died with a sum of money stitched into his fragment of a waistcoat, and encircled with a scroll enjoining those who find it "to bury him decent, or else his sperrit will haunt them for evermore." The injunction, coupled with such a penalty, is, I believe, never disobeyed. In the lack of relatives, professed *keeners* are hired, whose practised tones of woe sound in their wild cadence so like the burst of real grief, that it is often only by watching the unmoved countenance and unquivering lips of the old crones, one can distinguish their mourning from that of the wife or mother of the dead.

"How can I expect other people to come to my berrin, if I don't go to theirs?" was the unanswerable query of a labouring man, whose employer sought to convince him of his folly in losing many days' work by attending the funerals of persons with whom he had had only a slight acquaintance.

But I forget—I am writing of my country, not as it is, but as it was. Now the stern hand of hunger, ay, of direst famine, has dimmed the merry eye, and closed the white lip, whose tones were once so joyous. Buoyancy of spirit is gone with vigour of body; all the energies of mind are concentrated in the one fierce craving of animal life. "Food! food!" is the cry that echoes through the land:—the short bleak wintry day, and the long dark frosty night, alike resound with the shrieks of those who perish from hunger and nakedness. In nothing is the utter disruption of old cherished feeling more apparent than in the poor creatures' forced disregard of their dead. Instead of the careful laying-out of the corpse, the lighted candles, the protracted wake, where all who came were regaled with pipes and whisky, at an outlay which often sorely pinched the survivors, but was at all times made without grudging, they are now often compelled to leave the rites of sepulture to be performed by the rats, which swarm around the hovels, allured by their loathsome prey; and in many cases devouring the flesh of the dying as well as of the dead. In some rural districts, the bodies that have died of what is emphatically called "*starvation fever*" are interred by wholesale at the public expense, uncoffined and uncared for. Such scenes are horrifying to contemplate, yet they are true; nor can any human being foresee their termination. I will not, however, dwell on them longer, humbly trusting that the same gracious God, who, in Judea's favoured land, had compassion on the multitude, and, not willing to send them away fasting to their distant homes, created with his word a plenteous repast in the wilderness, may ere long send forth that mighty voice, to bid our fields once more be fertile, and our perishing poor ones live.

I will notice a few instances of the strange picturesque superstitions with which the poor Irishman, in happier times, loved to encircle the memory of his dead.

On a fine day in Autumn, about two years since, as a friend of mine, who resides in a wild district of the south, was walking on the road near his house, he overtook a countryman returning from the next market-town. He was a stout middle-aged man, tolerably well-dressed, and evidently belonging to the class of small farmers. After the customary salutations, (in no country do strangers meeting casually on the road greet each other more cordially than in Ireland,) Mr. — entered into conversation with him, as they walked along together.

"This is a fine day for the country, your honour, thanks be to God for it."

"It is, indeed," replied Mr. —, "and pleasant weather for walking. Have you far to go?"

"Why, middling, Sir; my little place is about five mile off, up at Gurthunowen."

"I suppose you were at M—— this morning?"

"I was, then, Sir, just doing a trifle of business at the market; for *herself*¹ wasn't able to go in to-day, and I had to sell some fresh eggs and young chickens for her."

"You seem to have been purchasing, also," said Mr. —, looking at a large brown-paper parcel, which he carried under his arm.

The man's countenance changed. "I was, your honour," he said, in a mournful voice. "After two years' savings, 'tis only now I was able to buy the makings of a cloak for my little girl."

As he spoke, he opened the parcel, and displayed its contents, a piece of fine blue cloth.

"That will make a very nice cloak indeed," said my friend, smiling, "your daughter will outshine all her neighbours next Sunday at mass."

"It cost two guineas, Sir; and though I'm a poor man, 'tis no more I'd think of that than of the mud under my feet, if 't would bring ase or comfort to the soul of my darling. Ah, *ma colleen bawn*!" he cried, clasping his hands in sudden agony, "the fifteen years you were left to me ran by as quick as the winter streama down the side of Coom Rhuo, and as pleasant as if the warm summer stopped with them always. But the dark day came at last;—and when the mother and I saw you stretched before us as cold and as white as the snow-drift on the hill, we thought the life within ourselves was gone for ever! I ax your pardon, Sir, for talking so wild, but indeed there was few in the whole country like our Nelly. Even when she was a slip of a child, going to the school, Father Jerry himself would stop her every Saturday after the catechiz, to stroke her fair head, and tell her she answered the best of them all. Well, after a while, when the first stun was over, and the mother and I had time to take some comfort from the two boys that were left us,—it began to give us more trouble to think that she died without a cloak, and that maybe the crathur that we kep all her life tender and warm, like a pet lamb, might be suffering now for the want of it. So we set to work, saving every penny we could scrape together, till we'd have enough to buy her a good one; and though the sorrow and the lonesomeness is hurling our hearts yet, still 'tis proud the mother and I will be to see it handsomely made, and waiting for her in the house."

"Surely," said Mr. — "if your daughter be, as I hope she is, in heaven, she will not need a cloak to shelter her there."

"No, Sir," replied the man, reverently touching his hat, "I suppose she won't."

"And in the other place, of dreadful punishment, it is equally certain that no earthly garment can avail as a covering."

"True for your Honour."

"Well," continued my friend, "you believe, what we deny, that there is a third place, which you call purgatory; but by all accounts it is a very hot place—what could she want of a cloak there?"

"Some of them," replied the father earnestly, "do be very cold there. In parts of it there's a dale of frost and snow, and sleet, and hail; and how do I know but my darling child might be there, thinking hard thoughts of the father and mother that wouldn't get a cloak to cover her. Any way, 'twill be made, and left in the house; herself may take the loan of it to wear at times, but 'twill be Nelly's cloak, and ready for her there when she wants it."

"In that case," said Mr. — "it would, I think, be a good plan if you had it made large enough to cover both; your daughter's spirit might then find shelter under it, without depriving your wife of its use."

"That's very true; indeed, Sir, I never thought of that before. Plass God, I'll have it done; and, sure 'twill comfort the mother's heart, when she's going to mass or to market, to think she has the sperrit of her *colleen bawn* along with her undernath the cloak."

This is the substance of a *bond fide* conversation: the firm persuasion entertained by the poor father that the departed possess a sort of semi-corporeal existence, is very general among the peasantry in the remote districts. Near the towns, of course, such superstitions have dwindled away, and the present general diffusion of education through the land will probably tend to banish them completely from the minds of the rising generation. Even now it is often difficult to draw from the mountaineer a candid confession of his faith in such matters. Does he suspect that you are quizzing him—and his perception of the slightest approach to *badinage*

(1) In Ireland, "*herself*" is the term invariably and emphatically employed by the peasant to designate his spouse, when speaking in the third person; the masculine pronoun being similarly applied to him by his better half.

is quick beyond expression—he immediately either shelters himself under a most natural appearance of stupid civility, agreeing with every thing your Honour says; or, if the humour takes him, and that he sees you are a British tourist, bent on making yourself thoroughly acquainted with all the chameleon shades of Irish character during a three weeks' excursion, he will be likely to cram you with a series of as improbable, not to say impossible fictions, as ever graced the hot-pressed pages perpetrated by an errant and arrant cockney. Those, however, who reside amongst them, and converse with them skilfully and kindly, without betraying any latent disposition to mock, will often discover curious corners and recesses of the Irish mind. Old customs and traditions also, lingering among the pagan monuments to which they probably owe their origin, are often, when explained, interesting alike to the poet and the antiquary. In later times the imaginative spirit, which still dwells amidst our highlands, has given form and consistency to many a strange idea connected with the abode and occupations of the dead.

I was struck with an instance of this which fell lately under my own observation, in the mountain district of the south to which I have before alluded. A belief is entertained there, and very generally, I think, in other places, that the last person interred in a churchyard is compelled to draw water for the refreshment of the souls in purgatory, until he is relieved by a new comer. When, therefore, it happens that two funerals are fixed to take place on the same day, the hurry, the racing, the fighting that occur between the rival parties, each wanting to secure precedence of interment for their friend, defy all description. On such occasions it will sometimes happen that the coffins are fractured in the struggle, and the cold ghastly faces of their occupants become exposed, presenting a horrid and reproachful contrast to the flushed angry countenances that surround them. Sometimes the scene ends in bloodshed; more frequently the weaker party yield the *pas*, with a bad grace, indeed, and generally inspired with thoughts of peace by the cogent arguments of the officiating pastor's horsewhip, which, potent in its office as the trident of Neptune,—pungent in its application as the sceptre of Ulysses, when it visited Thersites' back,—seldom fails to quell a rising tumult.

In the village of I—— there is an old churchyard whose narrow precincts are already filled with graves; yet, as it lies in the centre of a large parish, funerals arrive there very frequently. The grounds of a friend of mine adjoin it; his flower garden is, indeed, divided from it only by two low fences, and a narrow lane between, so that the inexpressibly mournful tones of the Irish cry are often heard distinctly there, contrasting painfully with the sweet song of birds, and all the joyous melodies of summer time. One day, as Mr. —— was standing in his garden, he saw a long procession appearing on the brow of the opposite hill. It wound slowly down a path made through the heather, and the wild sound of wailing that floated faintly on the breeze, told the reason of the sad array. As they approached nearer, the bearers of the coffin quickened their pace almost to a run, followed by their companions; and when they reached the road which led towards the churchyard, they dashed forward with a speed most unsuited to their solemn errand. The reason was soon evident. Passing a turn of the road, in the opposite direction, there appeared another funeral approaching with equal rapidity. At the moment that they came in sight, both parties were about equally near the goal; and it seemed impossible to tell which would win the race. A race indeed it was, for the rival bearers, exchanging a loud shout of defiance, rushed on as rapidly as if no burden rested on their shoulders. Arrived at Mr. ——'s gate, the people from the mountain saw that their direct path lay across his lawn and garden, and that, by rushing through, they might gain on the enemy. No sooner thought of than accomplished.

With the most reckless disregard of crushed flowers and trampled beds, they ran across, thinking not of the mischief they were doing one whom, nevertheless, they all loved and respected. They gained the churchyard, but owing to the intervening hedges, which had to be surmounted, their rivals were there before them.

"'Tis no good for ye, ye mane spalpeens," shouted the leader of the mountain party. "'Twas well we licked ye last fair day, when poor Denis was to the fore,—and why wouldn't we do as much now to save him from demaning himself by being water-carrier to one of your breed. Hurroo for the Cartys!"

And, without waiting for his foe's retort, which was by no means slack or slow in coming, he brandished his shillelagh, and, followed by his friends, rushed on to the combat. Furious and deadly would have been the affray,—indeed, at its conclusion, the candidates for sepulture would scarcely have been limited to two, but just at the critical moment, five or six well-armed "poelers" were seen advancing. The constable who headed them was a shrewd elderly man, thoroughly versed in the character of the people, and "up" to all their ways. He did not make any hostile demonstration, but interposing boldly between the parties,

"For shame, boys," he said, "for shame, to be fighting and destroying one another over the cold corpses of them that deserve better usage at your hands."

"Mr. Nagle," said the leader of the Callaghans, lowering his brandished cudgel,—a pacific movement which produced a pause between the combatants on both sides,—"'I'm satisfied to have it all to you, for 'tis well known you're an honest, sensible man; though, not being of our profession, 'tisn't reasonable to suppose you'd feel the same as we do in regard of the other world. Howandever, you see, we won the race fair; and I put it to you, now, is it right that them *shinguns* forinst you should bury their friend first, and have Thady Callaghan attending the likes of him with water?"

"'Iould yer tongue!" exclaimed the warlike chief of the Cartys; "'tis happy and proud the best Callaghan that ever handled a spade ought to be, to put his hands under the feet of a Carty! Whether or no, we're here as well as you, and the never a sod shall be laid this blessed day on Tade Callaghan's grave, till we have our own Denis handsomely settled."

"'Tis a folly to talk that way, man, while every mother's son of us here is able and willing to fight you—ay, and to take the consate well out of you, too, and show that your fists, at the best of times, arn't aqual to yer tongues."

"Oh! as to prate and palaver," retorted his adversary, "'tis aisy seen who has the most of it; but, you might as well get holy wather out of a minister's wig, as be standing argufying here with me."

"Whist, boys, whist, with that unsigned talk," said Nagle, "and let me insense you at wanst into the rights of the matter. 'Tis a sin and a shame for any two sets of Christians, let alone neighbours, to be fighting with one another, like wild bastes, over the bodies of the dead. Callaghans and Cartys, you seemed both of you to come up purty much about the same time. Now, I'd like to know what's to hinder Father Jerry—I see him coming towards us now, walking, poor man, as fast as the gout will let him—what's to hinder him, I say, from standing right between the two graves, and reading the service for both at wanst. Then you may lower the two corpses into the ground exactly at the same moment; so that Sir Isaac Newton himself, that fogged the world at algebra, couldn't tell which would have to draw the first pail of water."

This well-timed suggestion seemed to give general satisfaction. It was immediately acted upon, to the great joy and relief of the good Father Jerry, whom

1 This sentence was taken down, verbatim, from the lips of a countryman, a few weeks since.

repeated attacks of gout had rendered less active than heretofore in the discharge of that arduous portion of his pastoral duties which included promiscuous flagellation. After the simultaneous interment of the bodies, all present dispersed peaceably to their several homes; perfectly satisfied that, in consequence of Nagle's ingenious expedient, the purgatorial labour of water-carrying would be fairly divided between the departed.

Soon afterwards a circumstance occurred in the same place, somewhat similar to the above, yet also differing from it. Mr.— had been very kind and constant in visiting and relieving a poor man who lived at some distance, and who had long been afflicted with an incurable disease. His dim eyes used to brighten, and his thin hands were clasped together, as, with all the fervour of an Irish heart, and all the eloquence of an Irish tongue, he was wont to invoke unnumbered blessings on the head of the visitor, who, kneeling beside his straw pallet, sought to direct his mind towards the things of the eternal world. At length he died, and his family were left desolate mourners. They were poor—miserably so—and could not afford “a handsome wake;” but, when the day of interment arrived, the remains of Daniel Lynch were followed to the grave by a weeping train of relatives, whose hearts swelled with sorrow, deeper perhaps and more sincere than is sometimes found under crapes and sable drapery. Their number, however, was few when compared with the crowds that thronged towards the house of a rich farmer, who had died on the same day, and was to be buried at the same hour as his humble neighbour.

It so happened, that Mr.— was again in his garden, engaged in the pleasant task of cultivating his flowers, and watering them from a clear well, which bubbled up near the boundary edge. Even in that country, famous for its thousand sparkling streams—“diamonds encased in a setting of emeralds,” a jeweller might call them, if a jeweller happened to be taken poetical—this spring was distinguished for the sweetness and clearness of its waters. He looked up, as the keening met his ear, and saw the two parties approaching. They met at the churchyard gate, and for a moment, loud sounds of contention and mutual threatenings of hostility drowned the plaintive tones of grief. Mr.— immediately hastened towards the ground, and when he arrived there, saw with pleasure that the weaker party had resolved to yield. Already the priest's voice was heard reading the solemn service over the rich man's grave, while poor Daniel's friends drew moodily aside, and bent their eyes on his humble coffin. Mr.— went towards them, wishing to speak some words of comfort, but they seemed not to regard him. At length the widow, clasping her hands, threw herself on her knees, and raising her streaming eyes towards his face, cried, with a voice as earnest as though she were begging for her life,—

“Ah! Mr.—, 'tis yourself that was fond of him, while he was alive; and sure, now that he's gone, and has the sore burden laid on him, you won't refuse to let him go to your well for the water!”

THE HEART OF MONTROSE.

THE civil war of Scotland during the seventeenth and eighteenth centuries, so truly denominated “The Troubles,” while they created wounds which required the lapse of more than a century to heal, have yet afforded some of the noblest examples of chivalrous loyalty and generous devotion which history has gathered in her starry zone. Whatever be the judgment passed on the risings of 1715 and 1745, when, notwithstanding the growing prosperity of the empire under the peaceful dynasty of Hanover, men, ay, and women too, gladly perilled life and fortune for the wandering and forlorn Pretenders, few have refused to do honour to the memory of him who brought to the royal cause

the enthusiasm of youth and the glory of an ancient and unsullied name, whose brilliant victories retrieved the cause, and threw a halo over the troublous sunset of his martyred monarch—the chivalrous but ill-fated Montrose.

The undying loyalty which endeared him to the Highland clans,—the victories he won for the royal standard, amid Highland snows and immemorial mountains, were meetly followed up by the magnanimity and Christian heroism with which he met a death as terrible and undeserved as that of his king.

A dreary pageant it must have been, that, on that May morning, wended its way through the quiet streets of Edinburgh; Montrose richly dressed, “more like a bridegroom than a criminal going to the gallows, his delicate white gloves on his hands, his stockings of incarnate silk, and his shoes with their ribbands, on his feet,” seated aloft on a miserable cart, gazing around him with an unmoved eye on the ill-suppressed joy of the craven Argyle, on the stern array of Saxon soldiery, and, high above all, the grim apparatus of death.

“There was glory on his forehead,
There was lustre in his eye,
And he never walked to battle
More proudly than to die.”

Repelling the offers of spiritual comfort made by the Covenanting ministers, with the gentle words, “I pray you, gentlemen, let me die in peace,” he bent on his knees, and that rude multitude beheld with tears the hero-death of a high-minded and Christian nobleman. Thus died, at the age of 37, James Graham, Marquis of Montrose—a man whose presence was a sure presage of victory among Highland hosts, whom in his exile kings had delighted to honour, and of whom Cardinal de Retz, the friend of Condé and Turenne, spoke as “the only man that had ever reminded him of the heroes of Plutarch.”

According to the barbarous custom of the age, in his doom it was pronounced that “his head was to be affixed on an iron pin, and set on the pinnacle of the west gavel of the new prison of Edinburgh,” while his limbs were to be distributed among four principal towns of Scotland. On the night in which this doom was pronounced, he wrote with a diamond on the windows of his prison these lines, which, from the circumstances of their composition, are truly remarkable:—

“Let them bestow on every airth! a limb;
Then open all my veins, that I may swim
To thee, my Maker, in that crimma lake;
Then place my parboiled head upon a stake,
Scatter my ashes—strew them in the air—
Lord! since thou know'st where all these atoms are,
I'm hopeful thou'll recover once my dust,
And confident thou'll raise me with the just.”

But they who sought to deepen the guilt and infamy of the dead Montrose were but the unwilling instruments of spreading his renown; for it was these blackened remains of all that was once so graceful and true, that evoked the spirit of justice, and brought his murderers to a doom no less fearful. It was the vision too of these insulted remains that ever haunted the mind and nerved the red arm of his avenging grandson, the terrible Dundee.

When this reaction took place, and the friends of Montrose came forth from their hiding-places, and gathered from the four winds his bleached remains, the heart alone—that heart which had throbbed so truly for his king and country—was nowhere to be found. A deep mystery for long hung over its disappearance, which was only elucidated by the publication of family traditions.²

At the time of his execution, the friends of Montrose were scattered abroad, and most of them had sought

(1) Point of the compass.

(2) We allude to the Appendix to Napier's “Montrose and the Covenanters,” 1838.

for safety in foreign lands. It was to woman alone—that “ministering angel” in the darkness of affliction, that he was indebted for much of his undaunted bearing in his final trials; the hands of women had woven for him “the fine scarlet, laid over with rich silver lace, the bands and cuffs exceeding rich,” in which he died so bravely, and it was a woman who, in her deep love of the dead, at the risk of her own life, possessed herself of the heart of Montrose.

Nine years before this event, his nephew, the Master of Napier, had wooed and won the Lady Elizabeth Erskine, a daughter of the Earl of Mar. She proved well worthy to be the wife of one who (to use his own words) “could have lived with her meanly in the deserts of Arabia;” but who left his youthful bride to follow the fortunes of his kinsman. During the brief respite from public turmoil which he enjoyed, Montrose had become fondly attached to his gentle niece, and to her he had promised to leave, as his most sacred memorial, his heart. His mutilated body had been scarcely two days in the grave when this youthful lady, no unworthy daughter of the land of Catherine Douglas and Flora Macdonald, at imminent peril procured the rare memento of the illustrious dead. After having been carefully embalmed, it was placed within a steel case, made of the sword of the hero, and this again within a gold box, which had been presented to an ancestor of the family by a Doge of Venice. The whole was deposited in a large silver urn, and cherished by the lady as the dearest and proudest relic of the departed. It is pleasing to think that the features of this high-souled woman may yet be seen on the canvass of Lely. An old picture hangs in Merchiston Castle, near Edinburgh, the seat of her descendants, in which she stands, calm and noble in her look, in the brilliant dress of the time of Charles II., and with her hands placed piously around the silver urn.

Let us now follow the heart in its strange vicissitudes. Dearly as Lady Napier prized the relic, she deemed that it ought to be in the hands of the Marquis's son, who, along with her husband, was still a refugee in Holland, and to him it was accordingly sent. Years passed away, and the generation that witnessed the death of Montrose had been gathered to the grave. Continued troubles surrounded the family, and the precious urn was lost abroad. Chance, however, restored it to the fifth Lord Napier. A friend of the family had recognised it in the shop of a curiosity-dealer in Holland, and immediately purchased it. This nobleman, when travelling in France, was taken ill, and, on his death-bed, bequeathed to his daughter as his most precious legacy, the golden casket of her ancestors.

Again the scene changes—and the “sole daughter of his house and heart” is wedded and accompanies her husband on his country's service to distant India. While off the Cape de Verd Islands, the fleet of which their Indiaman is one is attacked by some French frigates. With the ardour and zeal that distinguish his countrymen, her husband volunteers to take the command of four of the quarter-deck guns. In the midst of the conflict stood the lady, with all the chivalry of her race, on the open quarter-deck, her son clinging to one hand, and the heart of Montrose in the other. It seemed as if that heart had power, even in its dust, to animate those around it to noble deeds, for there stood this weak woman with her youthful son, while the enemy's fire mowed down two of the men at the guns, and a splinter struck and shattered the outer case of the casket. The frigate was called off, and the gallant Englishwoman lived to see the relic repaired by the cunning of a Hindoo goldsmith, and to cherish it as the proudest memorial of her mountain home.

But alas! the veneration with which she viewed it became to her the cause of its loss, and it does not seem strange that what the English lady cherished so fondly, should, to the superstitious mind of the Hindoo, seem to possess the charm of an amulet, and confer on the

owner safety in battle. We find that it was stolen, and afterwards traced to the palace of an Indian chief, who had bought it from some one at a high price. And there it lay enshrined amidst the fantastic symbols of a strange religion, the simple object of a Hindoo's adoration. This chief was the Pollygar or captain of Pundlar-Courchy, a fort and district in the neighbourhood of Madura.

More than a century had passed away since the execution of Montrose; the factions that were renewed over his grave had for ever become quiet; the royal race to whose cause he had devoted his life-blood was represented by one old man, a cardinal of Rome; British arms and enterprise had opened up a pathway to the fabled wealth of the East, and now, beneath the tropical sun of India a Hindoo chief was prostrating himself before the heart of the “Great Marquis,” and bearing it about with him as a spell of sufficient power to shield him from the dangers of Mahrattar warfare. Thus, when, in the land of his birth, his chivalrous career, his high spirit of loyalty, and his heroic end, had become the theme of poet and novelist, all that was material of James Grahame was cherished by an ignorant Hindoo, as the source whence his spirit derived strength in the turmoil of war, and the suspicious calm of Indian tranquillity. We could wish we knew more of this man's history than we do; we know enough, however, to pay the tribute of admiration to his character, and of sympathy to his misfortunes. For it remains to be told, how, when informed of the circumstances connected with his “charm,” he generously restored the casket to the English lady, saying, that “he considered it his duty to fulfil the wishes of the brave man whose heart was in the urn, and whose wish it was that his heart should be kept by his descendants.” As if the charm that ruled the destiny of his life had indeed departed, he was hurried into revolt from the Nabob of Arcot, and fell a victim to the rigour of Anglo-Indian justice. There is something infinitely touching, we think, in the wish expressed by him on the eve of execution, that some one would preserve and cherish *his* heart, as they had done who loved the European warrior so well.

The heart thus singularly preserved and generously restored, remained in the lady's possession till accident again deprived her of it, and that for ever. Returning home from India with her husband through France, in 1792, their plate and jewellery were required to be given up to the French Government. For greater security, she entrusted the heart to the care of an Englishwoman, resident at Boulogne. Years passed on, the plate and jewellery were scrupulously restored, but death had removed the keeper of the casket, and with her all knowledge of the place where it was deposited.

T.

THE GREAT MYSTERY ON SALISBURY PLAIN.

YEARS have passed since first a certain huge pile of stones attracted attention. Ages have passed since the erection of these majestic remnants. Years, pregnant with the advent and reception of vast and weighty truths, have long since gone by, and yet they have neither brought nor left any certain record of those mystic monuments. There they stand on Salisbury plain, apparently defying all the influences of Time, the great destroyer of all things—assuredly defying all human ingenuity to decipher. A great mystery, truly! Who shall their purposes unfold to us? The Pyramids and the Man in the Iron Mask have alike baffled human perceptions to solve and define. So, too, Stonehenge is the great wonder of our isle, and, if anything can add to the astonishment which its appearance excites, it is the

extraordinary fact, that the greater proportion of visitors to it, consist of foreigners; Germans of all states, Italians, Frenchmen, Americans, &c. It seems impossible to account for the insensibility which leads many a tourist to leave it on one side, and seek for objects to gratify his curiosity miles and miles away. England does not contain any more stupendous piece of art, and certainly cannot boast of anything more wonderful; yet, to the majority of wonder-loving, pleasure-seeking Englishmen it is unknown, unthought of, and, it is to be feared, uncared for. The very situation of it is both imposing and commanding—standing quite alone, on a plain which looks interminable, and which on a hot summer's day or on a winter's night has neither tree or hut for shelter or repose near it. Majestic, wondrous pile! thy artificers unknown, thy uses undiscovered, how solemnly thou remainest in thy solitary glory! Thy bard should be another Ossian, and the chorus that responds to the chanting of thy grandeur, the roaring waves of the old ocean, that roll for ever and for ever, till Time and thou shall be no more. To attempt an explanation, or to elucidate this mysterious temple, is in these our later days of careful and rigorous inquiry an unsatisfactory task, and one which could afford no possible advantage to any one. Truth to say, we should end where we began. All is conjecture. That it was a temple erected for worship seems feasible enough to believe. That that worship was the religion of the aborigines of Great Britain, is also most probable. And if this latter supposition be received, we must at once give to the Druids the credit of its erection and appropriation for sacred rites. The theory at one time offered to the scientific world by that celebrated architect Inigo Jones is capable of a thorough refutation. It was his pleasure to give the Romans the credit of this structure; but it is manifestly an error to suppose that that people, who, long anterior to their invasion of this country, were masters of the arts of design, and lived and worshipped in buildings of a most constructive character, would have contented themselves with any temple so simple as Stonehenge. Besides, there are no analogous remains in localities more densely populated by the Romans than Britain ever was. Among all the relics exhumed from the barrows that are near, or surround Stonehenge, no Roman work has been found—no coin has ever been discovered in any of the tumuli—nothing to afford a clue or trace of a Roman origin. One more proof against the idea is the fact that a number of these circles of stone, more or less broken, are to be seen in all parts of the kingdom, in Ireland, Scotland, and in the smaller isles, and places where it is well known the Romans never went. The skilful reasoning and accurate investigation of Dr. Stukely are all against the probability of a Roman origin. The fanciful hypotheses that have been given to the world from time to time are most amusing, and would form an odd volume for the entertainment of those who are wont to date their conclusions from realities, and not imaginary speculations. But to one conclusion we must come at last. The Druids are almost beyond question the originators, and as priests the performers in this stupendous temple. It stands, as has been before noticed, on a vast plain. There is an outer and inner circle of stones. The outer is in diameter about one hundred and nine feet. The thickness of the stones forming this circle is three feet and a half; the number of stones forming the outer circle was sixty, of which thirty were stones standing upright, the remaining thirty being what are called imposts, that is, stones placed on the top of others. Both the uprights and imposts are each of one piece, so that the labour and difficulty with which they were placed in their position may be conceived. These uprights and imposts are maintained together by means of mortices and tenons, which are geometrically adapted to their work in the most methodical manner. The inner circle of stones was more irregularly shaped and smaller than the outer. In this were a number of stones

forming an oval. An altar and cell completed the temple.

Such is a very cursory description of the state of this most remarkable building, in the days of its normal greatness. Many of the stones have disappeared altogether, others have fallen, and but few remain in their pristine erectness. Enough, however, is left to show the design and intention of the founders; enough to impress the spectator with sublime and exalted feelings, which the character of the monotonous and dreary scenery surrounding is well calculated to heighten:—a solemn temple, made with hands yet withal so simple, with materials so plain yet so monstrous, that its effect is magnificent. One author says, "these upright stones seem to grow out of the earth as they stand." Another doubts the possibility of their having been conveyed from any considerable distance. It is said that the nearest point whence these stones could have been brought is sixteen miles distant. How they were brought, is one of the mysteries peculiar to the entire subject.

The Rev. J. Bathurst Deane, in his book, written in 1833, on *Serpent Worship*, states as his belief that they came from Grey Wethers near Abury, and that they were probably conveyed on rafts to their destination; these rafts being floated on a river which ran, as he considers, under the hill on which Stonehenge stands. In a survey made in the year 1845, it does appear that there are some grounds for this opinion, as evident traces of a river having formerly run by and past Amesbury were visible. But here, all is again mere conjecture, and in that dubious field it is impolitic to enter. Upwards of a hundred years since, Dr. Stukely, the Rector of All Saints, in Stamford, wrote an elaborate treatise on Stonehenge. Sir Richard Colt Hoare has made it the object of his studies, and corrected the errors of many previous writers. Wordsworth has made it the theme of one of his exquisite sonnets. Popsy in his amusing diary, written in Charles the Second's time, has the following passage, written in his own familiar quaint manner:—"So the three women, behind W. Ifewer Burford, and our guide, and I single to Stonehenge, over the plain and some great hills, even to fright us. Came thither, and find them as prodigious as any tales I ever heard of them, and worth going this journey to see. God knows what their use was: they were hard to tell, but yet may be told."

Mr. Turner, the celebrated artist, has transferred on canvas his impressions, and depicted the scene as viewed during a storm of thunder and lightning. It is a very vivid and actual representation of the spot. By moon light the effect is admirable, though no especial painting of it under that influence has been hitherto exhibited. It is greatly to be deplored that from the cupidity and stupidity of treasure seekers, who have fancied they should be richly rewarded for their pains, many of the stones have fallen and become otherwise detached from their places. The loosening of the soil, consequent upon repeated diggings, has been the cause of this mischievous foolishness. The name, Stonehenge, is derived from the Saxon words, *Stane-hangen*, or *Hanging Stones*. Camden styles it as "*Inaana substructio*," and in the works of many old authors it is called *Choir Gaur*, or *Chorea Gigantum*. Godfrey Higgins has contributed not a little to dispel the obscurity which for so many ages has enveloped Celtic remains, and Stonehenge has been particularly noticed by him. An ingenious argument has been given by Dr. Stukely, which he deduces from Sir Isaac Newton's *Chronology*, namely, that as the average duration of a king's reign is nineteen years, so, as he found nineteen barrows about the eminences round Stonehenge, he conceives the Druids to have enjoyed their magnificent structure about three hundred and sixty years.

There is one pompous absurdity, which for its mag-niloquent bombast shall not be omitted in the catalogue of those essays and essayists who have discoursed upon this matter.

A writer seriously announces his belief that it was erected countless ages ago, and that the stones, huge and vast, were carried to the plain on the backs of the mastodon, and other extinct genera of the fossil world. Why did not the man set to work, and paint a panorama of the gigantic procession wending its lengthy way to the desired locality?

To leave all suppositions and questionings to their inventors, let us view Stonehenge as it is, and taking for granted that it is a Druidical temple, let us transport ourselves to the outer circle, and then arranging it as it was, and indulging ourselves with a peep, like the learned Stukely, at the Sanctum Sanctorum, let us wait the rising of the moon from behind the sacred grove at Amesbury; so shall we see the entrance of the officiating priests, the Druids and Druidesses, and witness the solemn and hoary chief advance to the altar with slow and reverent footsteps, his face downcast, his beard long and smoothly trimmed; his clothes reaching to his knees are fastened with a girdle, to which is attached the bronze celt. In his hand he carries a forked stick, which fits on to the celt, and has enabled him to cut the mystic mistletoe which he holds in the grasp of his other hand. But ere the rites are accomplished and ere the victim is sacrificed, let us awaken from our dream and hail with thankfulness the advent and installation of Christianity all over the fair land.

In this spirit we shall view this mysterious fane with a deep and inward sense of the happy change, that has abolished for ever religious customs so abhorrent to our nature, and which have in them so much that is in manifest antagonism with an humble prostration of the heart. In this spirit we shall see, as it were in a mirror, very dimly reflected, a scene from the earliest history of old Britain; and the vision of that scene, and the reflections it will naturally suggest, cannot but prove attractive and useful. So it is permitted us in our mental comprehensions to unroll the pages of the transcript of our ancestors' lives and actions; and, if for no other purpose than this, it is to be hoped that Stonehenge will be preserved to us for ages yet to come, as an illustrative memorial of the past. In the criticisms of this past let us not altogether despise the contrivances of our rustic forefathers. We see here an admirable adaptation of many of the soundest principles of art. In the impost, or overhanging stones, nothing more effectual could have been devised than the mortices and tenons by which they were united to the uprights. Nor could the founders have met with any spot so appropriate for the effect they intended to produce. Viewed from whichever side it may be, it is ever the one imposing object. After traversing the monotonous plain in any direction, it presents itself to the eye with an absorption of interest which is uninterrupted, and which is heightened every way by the universal stillness, and the absence of anything to detract from the one great feature of the place. Even admitting it as a druidical temple, it is still open to scientific investigation. It is still, to all intents and purposes, a great mystery, one whose solution will, in all probability, never be accomplished. And if, from what tradition has handed down to us, we are to believe the awful accounts of human sacrifices, the shedding of human blood, the profanities acted in religion's holy name, and rites from which all but the Arch Druids were excluded, we shall indeed rejoice that all these things have passed away; and that it is what it is, this wonderful Stonehenge, a great mystery. Silence may well become its best and most fitting attribute; silence that, like night, spreads a veil over all things; a silence not of that nature where sound (or human sound) hath never been, as in the unpeopled deserts yet unknown, or in the great and pathless woods, where rifle never disturbed the natural voices of Nature's fairest children, the gentle birds; nor as that silence which hangs around the silver orbs at midnight, or nourishes itself in the caverns trodden by no foot, whether of man or beast; but a silence—

vast, tremendous, significant, and potent in its very stillness; a silence that reigns where once the voice of man spoke in tones all-powerful and commanding, astounding in their very depth and meaning, pregnant with terrible utterings, gone—lost; a silence that, of all others, makes itself the most felt, and appals the trembling heart of man to contemplate; a silence whose origin is written in the downfall of past dynasties, whose quietude is more terrible than speaking, whose history is of the past, and whose end is shrouded in the future. And this is the type of all mysteries.

THE PUBLIC WRITER; OR, THE EFFECTS OF GAMBLING.

"FATHER," said Severin, "I come to entreat your assistance in an awful moment, in which my life, honour, and situation, are at stake."

"Do you doubt," said his truly excellent father, "that I will assist you if in my power?"

"I owe an immense sum of money, and I do not possess twenty francs in this world; the officer will arrive to-morrow, to-morrow!—Do you hear, father?—to-morrow!—and if I have not twenty-four thousand francs before noon, I am undone!" As he said this, the unhappy young man trembled and wept bitterly. It was indeed a sorrowful sight to behold him thus humbled, and in the deepest despair.

"Twenty-four thousand francs!" said his father; "and where are they to be had?"

"The sum you have in the funds, Sir," said Severin, "and the interest of which you receive every three months."

"That would not suffice," said the almost heart-broken old man; "but I see I must add to it the price of this cottage, and then all your debts will be paid; but, before I sign the deed, which leaves me without a sou, I require you to acquaint me thoroughly with the state of your affairs."

"They are not desperate; I have still resources."

"Well, then, I must know them all; I will go to your house, and examine for myself."

Severin, at these words, became still more pale and trembling, but his father spoke with so determined a voice, that he knew he must be obeyed. Madame Varanchau was awaiting in the saloon the return of her husband; the poor young woman knew too well their misfortunes; her eyes were filled with tears, but the expression of her countenance was that of resignation. On seeing her father-in-law, she rose to salute him.

"My dear Lucie," said he, as he kindly took her hand in his; "place all your confidence in me, for I will never forsake you."

She began to weep; and, as she sat down by her husband, he exclaimed with bitterness: "My father says he must know all the particulars of my affairs; so we must tell him; and you must know, my dear Lucie, that I would gladly spare you both this mortification if you would place more dependence in me."

"Let us go into your office, Severin," said M. Varanchau. "I am come here to investigate your affairs, and to sign a deed."

"It is quite useless to show you my books," said Severin, sullenly; "of what use will it be to make the clerks in my office witnesses of this examination?—I can tell you—" Then, after a moment's pause, he added, with a hoarse voice, and wringing his hands in agony, "I am ruined!"

"But you have not told me what has caused your ruin!" cried M. Varanchau; "and that is what I now require you to explain. I suspect the cause,—I have already said so,—but now I must learn it from your own lips."

Severin was silent.

"Then," said M. Varanchau, "I must tell it myself: It is gambling which has brought you to this miserable state."

"It is true," said Severin, proudly.

"And I," said his unhappy father, "had fondly hoped your honour was not sacrificed!"

"Have I lost my reputation," interrupted he, scornfully, "for having gambled, and lost? Truly, Sir, to hear you speak, one would imagine I was a rogue!"

"You are not yet one, perhaps, but you will become one eventually,—prison,—the galleys,—such will be your fate! May I die before that day arrives!"

Severin was enraged at these words; his eyes flashed fire, and his voice trembled with rage, as he thus addressed him: "Sir, you have no business in my house, since you are come to insult instead of assist me; this conduct is only that of a heartless man,—depart!"

At these words M. Varanchau rose up, but Lucie caught him, exclaiming, "Oh, my father, he is your son!—he is in despair!"

"I have no longer a son," answered the unhappy old man, his voice agitated with anger and grief: "he who once bore that name I renounce,—a father's blessing rests on him no more!"

To these sad words the gambler, the wicked son, only replied by a threatening look, for he feared to give vent to his passion.

"Will you come with me, my child?" said M. Varanchau, affectionately, to Lucie; "you shall share with me the little I now can call my own."

She kissed her father-in-law's hand; then, with meek resignation, followed her husband, saying,—"Death alone shall separate us!"

The following morning M. Varanchau sent his son a deed, assigning to him all his property; this satisfied the creditors, but left him and his family in extreme poverty. In the evening, when Lucie went to the cottage to thank him for all his kindness, and to entreat his forgiveness for her husband, she could find neither him nor Madelaine; and there was written on the gate, "To be Sold." She went away disheartened; and no one in the town could tell her what had become of them. In a few days, Severin quitted Marseilles, accompanied by his truly devoted wife.

When M. Varanchau saw himself without fortune or home, compelled to expatriate himself, and to quit the place where he had lived for many years, respected and happy, he was at first tempted to give way to despair; but, as he was a religious man, he trusted that God would not forsake him in his adversity. He knew he should now work for his livelihood, and he submitted to it without a murmur, notwithstanding his declining years. His faithful Madelaine had accompanied him; they lived together in Paris, and at first it occurred to M. Varanchau to give lessons in history and geography; but then his advanced age was against him; besides this, he should have to wait till pupils presented themselves, and now he had no other resource than Madelaine's little savings. Laying aside all false pride, he determined to become a "Public Writer." He wrote very well, understood grammar better than the academy, and calculated like Barême. Nothing more was required than a writing shop in the square of Saint Geneviève. It was indeed an affecting sight to behold this poor man, at sixty-five years of age, commencing a trade which required so much patience and application. Early in the morning he was to be seen seated in an old arm-chair, at a table, on which were ranged papers of every size, a variety of seals, and models of complimentary notes in prose and verse. Soon "Father Pierre," as he was now called, was in great request. He could scarcely attend to the crowds of people who daily assembled round him; and was obliged to enlarge his shop, and take clerks. There was a desk for complimentary letters, another for recommendatory ones, others for invitations and petitions. It was in this last kind that Father Pierre excelled, and acquired a great

reputation: he had a method of petitioning which would have softened the hardest heart; and it is even recorded, that the stern inspector of the police shed tears as he read a petition penned by Father Pierre. During the day, those who walked in the square St. Geneviève might see through the bright windows of the shop, the white head of this industrious old man, whose attention was never diverted from his employment. Every one knew Father Pierre,—every one loved and honoured him; but all their inquiries to discover who he was were in vain. They remarked his bearing, education, and politeness: some said, "He is a great Polish lord, ruined by the late war;" others, from his southern accent, thought him to be a Spanish refugee, but no one knew his real name. At night, Madelaine came for her old master, and both repaired to a retired apartment in the vicinity of the shop, which was neatly kept, and tolerably well furnished.

"My good master," said Madelaine frequently, whilst they supped together, "when will you cease working!—it appears to me we are now rich enough."

"Not yet," said he; "if ever my unhappy child returns, I must have enough for him and myself."

Thus twelve years passed away. Father Pierre was very old, but his hand had not lost its skill, nor his mind the power of framing petitions; and he had always more to do than he could accomplish. During those twelve years he had written several times to Marseilles to inquire for his son, and no one had answered his letters, for they had nothing to communicate respecting him. "He is dead; surely, he is dead," often repeated the poor old man; "he has died with his father's curse upon his head—my poor child!"

One day, when Father Pierre was seated at his usual occupation in his shop, a little girl came up to him timidly; she was very pretty, but her patched gown, worn-out shoes, and scanty covering, indicated her extreme poverty. "Sir," said she, "I will thank you to write a petition for me, but I have only six sous to give you for your trouble."

Father Pierre looked over his spectacles at her: "My child, how old are you?"

"I shall soon be ten, my good Sir."

"And is this money your own?"

"Oh, yes! yes! it is indeed!" said the child, with a voice so sad, that it struck the old man.

"I never tell lies, Sir! Oh, do you not believe my word?"

"Will you tell me how you got this money, my dear?—it is certainly very little, but it is a great deal for one in the condition you are."

The child hesitated at first, then replied, with her eyes cast on the ground, "I have saved it, Sir."

"Saved it, child! then you must have saved it from the money your mother gave you to buy bread for her?"

"Oh, no! no! no!" cried she, as the colour rose to her pale face at being thus suspected: "I have saved it from my own meals; every day my father gives me two sous to buy bread for myself, and I have only spent one sous every day for the last week."

"I will write your petition for nothing," said Father Pierre, returning the child her six sous. "Is your mother alive?"

"Alas, Sir! it is a month since she died!" Here the little child began to cry, but she hastened to wipe her tears away; and, pointing to her patched frock, she said: "We are so poor that I am not able to get a black frock as mourning for my mother."

"And you wish me to write a petition for you," said Father Pierre, kindly; "you have, then, some protector?"

"No, my kind friend, I have not; but a thought came into my head,—a very good thought, too, I assure you."

"Well, we shall see; sit down there, and warm yourself by the fire."

Encouraged by his kindness, she sat down by him,

and said: "I am going to tell you my story, which is not long,—My poor mother is dead, and I have no one to love me but my father, who is very kind and good, but he cannot work, for he is almost always ill, and the miserable home we have is enough to break his heart; as to me, I do not mind it for myself, but I weep when I see him wanting everything. We have nothing; neither wood, nor a blanket on our bed; and it is so cold, the other night I could not sleep!—I heard my poor father weeping!—then a good thought came into my head; and that is, to ask some assistance from the Count of C——, who is a very rich and charitable man; he lives at the corner of this square; and, if he would take me into his kitchen, I would wait on the servants, and work day and night to get a little bread and money for my dear father! Do you think you could make such a petition for me, dear Sir?"

Father Pierre took his best pen, and wrote a touching letter, in which he described the poverty and goodness of the little orphan, who only asked for work in order to earn her bread. "Now it is finished, my child," said he, "we must sign it,—what is your name?"

"Lucie Varanchau."

At this name, Father Pierre's pen fell from his hand, and he trembled so much that the child feared he was ill.

"Oh, my good Sir!" said she, "what is the matter?"

"Nothing, nothing," said he, recovering himself. "My dear little one, I myself will send your petition; come to me again to-morrow, and you shall have, perhaps, an answer; and that a very favourable one."

She was leaving the shop, having thanked him most warmly:

"Embrace me, Lucie!" said the old man, extending his arms to her.

She threw herself into them, weeping with hope and joy.

The next day, when she returned, he took her on his knee, and said to her, "My love, I have delightful news for you."

"Ah! I shall be taken into the Count's service, and my father shall have some assistance!"

"Better than that, perhaps; but, tell me, what does your father do now?"

"He copies letters, for he writes a very good hand—almost as good as yours; it is he who taught me to read and write a letter."

"Are his parents alive?"

"They are both dead, Sir; my father taught me a prayer, which I repeat every day for grandpapa's soul."

Father Pierre could not hide his tears; he embraced the child, and exclaimed, in broken accents, "You are a good little girl, Lucie, and God will bless you!" When his emotion had a little subsided, he took several crowns from his desk, and gave them to her, saying, "Take these to your father: with them he can buy clothes for you and himself; and this evening you must come and sup with a person who can and will help you. There is the address."

The little child ran with the greatest eagerness to communicate the joyful tidings to her father. In the meantime Father Pierre gave his orders to Madelaine. "Have a good supper," said he; "this shall be the best I ever had; a bottle of good wine,—the poor man has not taken anything for a long time;—and, especially, have an excellent fire, for he has suffered much from cold."

Madelaine was in such delight, she scarcely knew what she was doing, and could hardly contain herself at the thought of the charming Lucie, to whom she was to be a second mother. Father Pierre had already walked fifty times up and down his room, and was anxiously looking at the alabaster clock which ornamented his mantelpiece, when a gentle knock at the door announced their arrival: then his strength seemed to forsake him, and he was obliged to sit down while Madelaine ran to open the door. *Severin* entered:—how old he looked!—how changed he was!—even his

father could scarcely recognise him. He advanced with a retiring air, holding his daughter's hand, and said, without raising his eyes, "Sir, I cannot express the gratitude I feel for all your kindness to one unknown to you."

Father Pierre rose, and answered falteringly: "It appears to me, this is not the first time that—"

At the sound of that voice *Severin* threw himself into the old man's arms, exclaiming, "My father! oh, my dear father!" For a quarter of an hour there was nothing but tears, embracings, half-finished sentences,—they heard not each other,—all spoke together, and appeared intoxicated with joy. When these transports of delight were over, Father Pierre took Lucie on his knee, and said, "My child, you are now to live with your grandpapa,—we will never separate again."

"Never, never!" said *Severin*, weeping. "Oh, if my poor wife could but witness our happiness! She, who shared all my misfortunes,—if she only knew you forgave me, father! But, doubtless, from heaven—where she now is—she watches over her child, and me; she sees us now, and participates in our joy!"

"My dear son, it was she who led Lucie to my shop. Alas! without that providential occurrence, I might have died without again seeing you, and you would not have got my blessing!"

"Misery and misfortune have punished my faults. Oh, by what a train of suffering have I been led to repentance!"

"My son, that is all past now; you no longer shall want for anything, as God has blessed me abundantly."

"Grandpapa," said Lucie, "I will attend on you, and take great care of you; and will you allow me to help Madelaine in the house?"

"Yes, my child," said Madelaine; "come, we will go and prepare supper;—a good supper I have got for you and our dear *Severin*!"

Whilst they were arranging the table, Father Pierre took his son into a little closet, opening into their sitting room, and made him acquainted with his good fortune, and the state of his affairs:—"I have in this desk a bill of two thousand francs, that is a nice capital; so, my dear son, if you wish to enter on a profession, I am able, and very willing to assist you."

"I have chosen one, father."

"What is it, my son?"

"The same as yours,—we will work together,—I never again will leave you."

"Supper is ready," said *Father Pierre*; "to-morrow I will install the new Writer in his office."

THE EARL'S SON.

A CHRONICLE OF THE TIME OF KING RICHARD II.¹

"Sir John, have you in your chronicle, what I am going to speak of?"

"I do not know," replied I, "but begin your story, which I shall be happy to hear, for I cannot recollect every particular of my history, nor can I have been perfectly informed of every event."

"That is true," added the squire, and then began his history in these words.—*Froissart's Chronicles.*

King Richard of England, learning how the French and the Scots had invaded the north, and were over-running it with fire and sword, issued forth with a summons for a large armament, and, with the numerous lords who obeyed it, took the field, and marched towards Scotland. There was a young and valiant knight, Sir Oliver de Vergy, who heard and answered this call with much joy, for he had been sore disheartened by the truce made between France and England. Though young, Sir Oliver had often shone in the tournament and in the field, and his gallantry being well known, he was at his coming greeted accordingly. He brought with him a fair young squire, who for the first time

(1) By the Author of "The Lunatic Asylum."

bore arms. His name was Raymond Messiden, the only son of a widowed mother, a dame of fair degree, who had entrusted him, not without many tears, and great misgivings, to Sir Oliver, that he might perform his first deeds of arms under his direction. On this stripling De Versey did bestow a surpassing tenderness,—even as that of the mother who bore him. The boy was of a rare mettle, but of a delicate frame (having been somewhat too carefully nurtured by the Lady Joan, whose only solace he was), and the king's forced marches in his haste to overtake his good uncle, Lancaster, to aid in repelling the invaders from his kingdom, proved too much for his strength. He sickened, and was forced to tarry awhile in the good city of York, where he must have died had it not been for the unwearying tending of his loving master, who watched beside his pallet day and night, administering with his own hands such draughts and simples as the leech whom he sought out skillfully prescribed. When Raymond Messiden was recovered from his sickness, the young knight set forward with all speed to make up for the time he had lost, and he and the twelve lances who went with him, got up with the king and his army ere they quitted their quarters in the country about Beverley. And now fell out an adventure, in which the youthful squire thought to show forth his grateful zeal for his tender master, and did but meet his own death, and plunge him he loved and served in endless trouble.

Arriving thus late, the good knight found that there was some difficulty in being suitably lodged; at least, as near the king's person or that of his uncle as he was fain to be, for this was the point most desired by the earls and barons, and knights of the realm. Now while Sir Oliver went to make his coming known to divers of his companions in arms, and to learn what news were rife in the camp in his absence, he left his squire and his train to prepare lodgings for him ere night. They did find in a neighbouring village such as they deemed very meet for the occasion, and with much satisfaction did proceed to establish themselves therein. Now, whilst they were concluding their bargain with the good wife, did two archers arrive, clad in the livery of Sir Lionel Nevil, with a party of men-at-arms, followers of the Earl Nevil, and straightways began they to wrangle with the train of Sir Oliver, roundly declaring that they had already procured these lodgings for their master, and were about to prepare them for his reception. Whether their bold assertion was but a lie vehemently urged to serve their own purpose, or whether the good wife had indeed played them false, and had now driven a bargain more to her mind, Raymond Messiden and his men paused not to inquire, but haughtily replied that "Sir Lionel, or a better man than he, must shift as he could, until their master was fairly housed."

"There is no better man, except the good earl his father, marcheth with the king," replied one of the archers, tartly. "As for thy lord, 't were honour enough for him to hold the stirrup to mine as he mounteth."

"Thou dost grievously lie if thou wouldest prefer thy lord above mine in honour," cried Messiden. "But get thee hence. I wrangle not with such as thee. Here Sir Lionel lyeth not to-night, make thee sure of that, and begone."

It had been well had the archer heeded these words; instead of so doing, with more foul animadversions on the knight whom Messiden served than it was meet for the youth, if true of heart, to hear tamely, he declared his resolution to abide there, and with his companions to hold the house for Sir Lionel Nevil. The squire, greatly fired by this treatment, unsheathed his sword in haste, and brandishing it, cried,

"Now an I did believe thee in earnest, villain, I would thrust this blade through thine heart."

Then the archer believing, or feigning to believe, that his life was in danger, stepped back a pace among his comrades, and bending his bow, let fly a good

arrow, which transfixed the youth so cleanly that it passed through his body, and appeared on the other side, and Raymond Messiden fell dead on the ground.

The archers and their company fled straight to Sir Lionel to tell the ill deed that had been done, and roundly did he rate them therefore.

"Nay," said the archer, "an I had not killed him, he had killed me, and I had as lief he should die as I should."

"Get thee gone, knave," cried Sir Lionel. "Keep out of sight, for I know not that I shall easily earn thy pardon. Methinks I have heard tell how that Sir Oliver bears a wonderful kindness to the youth thou hast pierced; and if so, it may go hard with thee yet;" so the archer made off as swiftly as he could, and held himself aloof.

Now the suite of Sir Oliver sought him out, and told him of the murder of his beloved squire, and for a while the young knight was more like a madman than one who was sane; so sorely was he incensed at the sudden and ignominious fall of a stripling of such exceeding beauty and courage, whom he had taken from his home to win the spurs of knighthood in the field. Coming to where the body lay, he gazed on it awhile, with a passion which threatened to suffocate him: the veins swelled in his forehead as if they would burst, and he crimsoned all over. Nor was he long withheld by shame from letting fall tears, as bitter as a brother could have asked, as plentiful as a woman could have shed. Probably he thought on the sorrow of the Lady Joan, which he would have to behold when he should bear back these tidings to her, and how he should be unable to allay it, by speaking of glory purchased by early death. He stooped down beside the youth, and dipped his hand in the gore which still oozed from his death wound. Thus said he:—

"Thou dear one, doubtless thou shalt have a vengeance that shall make thy name known far and wide full as much as any deed of thine own could have done."

He sprang to his feet, and dismissing his softer sorrow, called loudly for his charger, and, vaulting into his saddle, rode madly across the country, followed by some of his followers, who deemed it not meet that he should ride alone in a mood so troubled. It was now dusk, yet still Sir Oliver spurred his horse on, regardless of all impediments, resolved to seek out Sir Lionel, and of him to demand satisfaction for this deed. Entering a narrow lane, he galloped along it at his utmost speed, till he became sensible of the approach of some horsemen. The darkness prevented the two parties from recognising each other, and reining in their steeds, each challenged the other to declare who he was.

"I am Nevil," cried he who rode at the head of the intercepted party.

A brief silence followed this declaration.

"And I," then answered Sir Oliver, "am De Versey, and I come in search of thee, thou Nevil, for thy people have murdered my squire, whom I loved as much; and I must have blood for his."

So saying he placed his lance in its rest, and urged his horse violently onward. But too well employed was this lance; he felt that he bore his opponent from his saddle, but he paused not to inquire the extent of the injury he had inflicted, but galloped on. His servants followed him at less speed, and they heard the attendants of Sir Lionel shout after them: "De Versey, thou hast slain this brave young Nevil. Heavy will this news be to the father when he knows it."

Then rode they quickly after their master, and told him: "Knowest thou that thou hast killed this young lord?"

"It is well," replied Sir Oliver; "less precious blood would not have atoned for that of Messiden."

He paused awhile, and reflected gloomily; then saying—"On!" set spurs again to his horse, took his way to the town of Beverley, and riding straight to the porch of the church of St. John, dismissed his attendants, and entered into the sanctuary.

Meantime the followers of Sir Lionel raised his bleeding body from the earth, and bore him to the neighbouring village church. They roused the monks of a near convent, who came with great wax-lights, and watched beside the corpse till morning, preparing it for the burial. Then proceeded they to the quarters of Earl Nevil, and told him that his brave, and beautiful, and accomplished son was slain. This was the only, as well as the beloved son of the Earl, and immeasurable was his sorrow at these tidings. Not less was his rage; he sent a hasty summons to all his friends to come and advise with him how to act. When before this assembly was rehearsed how this sad accident fell out, the nearest kinsmen, and those who best loved father and child, parleyed awhile, and strove alike to calm the grief of the former, and to devise some means of avenging the fall of the latter. The wisest among them counselled the good Earl to wait the dawn, and then to seek the King's face, and declaring his wrong, to demand law and justice. Then they separated in order to prepare to render the last honours to their fallen kinsman, with as much decorum as possible, and assembling together all who bore relationship to the family in the camp, they proceeded to the church where the young knight lay, clad in his armour, unhelmed, and his face uncovered. When the Earl arrived, he walked straight up to the bier, and kneeling down beside the corpse, he clasped the hand of the deceased. They that stood around saw his lips move, and though they heard no sound, they judged from the stern grim mien which he maintained, that he uttered a vow of vengeance. Then gazed he fondly on the face that was so very beautiful, nought disfigured by wounds, or pining sickness. He laid his hand on the head, which was thickly covered with long glossy hair of a shining golden hue, and, separating one heavy curl from its fellows, drew his sword, and with that severing it, he placed it in his bosom. This act seemed to melt his heart within him; but it was not for a warrior like him to bear to be looked upon in the weakness of grief. With somewhat of scornful impatience he waved his hand, bidding all retire, and leave him awhile alone with his child. They who tarried within the porch could plainly distinguish groans and sobs of anguish. The obsequies were duly performed by the monks who had tended the corpse, and the mass was said by their superior, and much honour was rendered, though little time had been bestowed in the arrangements of the proceedings. The sword of the fallen knight was offered by his cousin to Lord Palmer, supported by two other knights near of kin. The bold Sir John Melchere, similarly supported, appeared with the shield. The helmet was borne by his companion in arms, Sir Aymer Roussel, one of Sir Lionel's own age and favour, and Sir Evan Cocherel led his war-horse. As soon as the service was ended, the company, to the number of sixty and upwards, mounted their horses, and the Earl, in a voice of command not so firm as it was wont to be heard in the field, cried, "Now to the King." When they reached the King's tent, they readily gained an interview, for he was already informed of the sad event, and heartily lamented the loss the good Earl had sustained, and the rash deed of Sir Oliver.

No sooner did the Earl enter the presence of the King, than he knelt low before him, and those who saw him now for the first time since the death of his son, could already plainly discern the traces of the havoc grief was committing on him. Though in the presence of a great company, he now shed tears freely, and he spoke with a rare passion, as if life depended on his moving the King to avenge his cause.

"Thou art king of all England," he cried, "and thou hast solemnly sworn to maintain the realm in its rights, and to do justice to all men. Thou knowest that Sir Oliver de Versy hath, without the slightest reason, murdered my son and heir. I therefore come to demand justice; otherwise thou wilt not have a worse enemy than me. I must likewise inform thee that my son's

death affects me so bitterly, that if I were not fearful of breaking up this expedition by the trouble and confusion I should make in the army, by mine honour it should be revenged in so severe a manner, that it should be talked of for a hundred years to come. During this march into Scotland, I will talk no more of it—I would not like the enemy to know of my great misery, and to rejoice therein."

"Nay, fair lord," replied King Richard, with the dignity by which he was so distinguished in his early days, "let not thy heart misgive thee. I will do justice, and will myself punish this crime more severely than thou and the barons could dare to do."

The Earl and his kinsmen returned thanks for this royal assurance, and departed from the King's presence. Meantime one acquainted with the determination which the Earl and the King had come to, made his way to St. John's Church, and told it to Sir Oliver de Versy, who, thus assured of present safety, quitted the sanctuary. During the night and morning which Sir Oliver had passed in retirement, he had time to recover the heat which had put him on so desperate a deed. In no wise could he pretend that the youth he had slain had been the wilful occasion of the death of his favourite squire, and, while he bitterly bemoaned the loss of Messiden, he could not but be visited by remorse for having killed the only son of his father. This train of thought received a further aid from without. The priest who admitted Sir Oliver to the sanctuary was an aged man, and a holy; he had seen many a rude offender, and some humble penitents, seek the same; but he thought he had never beheld among them all a deeper grief than that which appeared on the countenance of this young knight, and he tarried near him to see if he were fain to ease his troubled soul of its burden. There was that in the sanctity of this aged man's office, and in the mildness of his bearing, that awed Sir Oliver more than the presence of the fiercest enemy could have done. In the morning the priest dismissed Sir Oliver, a sorrowful man, but a penitent, and when he gave gold for masses for the soul of young Messiden, he said: "Good father, I would bid thee to say also prayer for Lionel Nevil."

"God speed thee, my son," replied Father Philip, with affection. "I will heed thy wish, and for thee will I pray, that thy pride may be tamed, and that the good resolutions thou hast taken this night may abide by thee." The knight bent his head for the priest's blessing; then mounting his horse, he rode sorrowfully forth from the town of Beverley, towards the lodgings for which he had paid so great a price. About a bow-shot from the town Sir Oliver perceived a party of horsemen approaching him, and he quickly recognised that he who rode at their head was the Earl Nevil, by his shield argent ongle with azure. The blood rushed violently to the young knight's face, and he thought to turn out of the path, that he might not meet face to face the father of the man he had slain not twice twelve hours ago; but he saw that he rode with fewer followers than the Earl, so that such a deed might be misconstrued, so he held on his way. As he approached the Earl, his late discourse with the priest, and the feelings of his own heart, inclined him much to speak some words of grief and apology. He slightly checked his horse as if to pause. The Earl's beaver was up, as also was Sir Oliver's, and when he met the eyes of him he had injured, there flashed from them a glance of such deadly hatred, as struck him almost as if it had been the lightning of Heaven. His hand slackened its hold on the bridle, his eyes were dazzled, and he reeled in his saddle: but he collected his astonished senses as he best could, and set forward again without comment on the speechless rebuke he had received. Now from that hour it seemed to Sir Oliver a vain thing to speak to the Earl, and tell him how he heartily bewailed the cruel blow which his hand had struck. When that strange threatening look rose up before him, his tongue clave to the roof of his mouth with dryness, and his heart, which was a stout one,

failed. Glaring as the lightning, that look had been as sudden; and oft was the knight most curiously tormented with a desire to encounter it once again, that he might learn why it cast so powerful a spell upon him. Angered at its baneful influence, he sometimes cried, "Would that I might meet that fierce challenge again, and cast it back as fiercely!" But his heart failed not to reprove this desire, for never had it beat so proudly as heretofore, since the night that he knelt at Father Philip's feet, and listened to his ghostly admonitions.

Meantime the Earl, whatever were his feelings inwardly, faithfully kept the promise he had given unto the King. He used no despicable language, and no discourteous behaviour towards his enemy, nor sought to find offence in his conduct. But if De Veray attempted to proffer in the smallest instance aught that savoured of gentleness, the Earl put it aside, not so much with an intentional evidence of scorn, as after the manner of a man who hath set his foot unawares on a slimy reptile, or detecteth a venomous insect in his draught of wine. Then said a trusty friend to Sir Oliver, "Thine enemy biddeth his time. He hath the King's promise, and he retesth thereon, and he hath given his own, not to disturb the internal peace of the camp by taking vengeance with his own arm." Soon after Sir Oliver discovered that nought that he did or even purposed to do remained long a secret from the Earl, even when confided to his nearest friend. Wherever he went, he was sure to find some one of the Earl's people near at hand, as if directed to follow in his steps; then would such fiery anger as had urged him on against Sir Lionel blaze up afresh within him; and knowing not how to expend it, he would gnash his teeth with rage. Sir Oliver was a brave man; one who loved war and perilous enterprise; but he loved not thus to be dogged to the death, and he pined and sickened. In his sickness he thought on that which had overtaken young Messiden, and how he had tended him in it, and how he might now have received the same services at his hand had he been yet alive. He turned restlessly on his pallet, and groaned. At length he resolved that, sick as he was, he would rise with the dawn, and betake him to the King, and say, "Sire, appoint me what punishment thou wilt, even unto death—only let me undergo it suddenly, for I am well weary of my life, being under the eye of him that so hatcheth me." But with the morning came his squire of the body to him, saying with a sorrowful visage, "Sir, the King designeth this day to cross the river, and to attack the fair castle of Stirling, and thou wilt win no honour there, because thou art sorely ailing."

"Sayest thou so?" replied the knight with sudden alacrity; "prithce, good Ralph, bring hither my helmet and my body-armour—speak to me no more of ailments. I was but sick for want of meeting thee." And never went forth Sir Oliver more blithe of heart than this day, saying to himself as he went, "Now, and if I fall in the field as a loyal knight should, I shall disappoint those who keep an ignominious death in store for me."

Sorely chagrined was Sir Oliver to find that the Earl Nevil rode forth at his side, and beside him forded the river, and took up his station beside him in the castle ditch, ere the assault began. For the first time spoke he willingly to the young knight, saying betwixt closed teeth, "Thou shalt not die honourably this day." These words fell on Sir Oliver's ear, and chilled him to the heart. There was in them a threat and a prophecy; for he could not find his death that day, though, led on by his desire to leave his body on the field, he fought rather like a madman, than a man of cool courage. Let him plunge ever so wildly into the thickest of the fray, and where bolts and stones fell fastest, his enemy was not slow to find his way to the same point. This constancy did so enrage Sir Oliver, that in a moment of fury he felt disposed to turn, and plunge his blade into the heart of his pursuer. But even as he turned, a more honourable thought sprang up in his breast, and profit-

ing by a brief suspension of the strife, to address the Earl, he cried,

"By my faith, one or other of us must be laid low; we cannot live together. Come a little way out of this press, and let us try our strength against each other."

"I have given my word not to attempt thy life," replied the Earl, grimly, "and a Nevil knows not how to lie."

The brief pause on the part of the besieged was but a preparation for a furious sortie, which threatened to carry all before it, yet did not this outpouring of the Scots avail to separate De Veray and his foe. Still stood they side by side, when Sir Oliver perceived, more quickly than his companion, a Scot coming secretly upon them, who made a thrust at the Earl with his lance, thinking to pass him through. The young knight seized him in his arms, forcing him aside, so that the lance passed him, and entered deep into the ground; then with rare swiftness of thought and deed did Sir Oliver sever the lance in twain with his sword. The Scot cast down the useless portion of the lance which remained in his hand, and grasped the battle-axe which was slung over his shoulder, and fell furiously on the knight,—the Earl standing by to view the combat. It seemed that Sir Oliver must fall before the heavy blows of his assailant.

"Yield thee, rescue or no rescue," cried the Scot.

"I will be his rescue," said the Earl, coming to his aid; and before them both the Scot fled.

Sir Oliver looked doubtfully on the Earl; each owed to the other his life, and each was loth to acknowledge the debt. De Veray, if wrathful, was generous.

"Sir Earl," he cried, "the life which this hand took hath been a cause of ceaseless regret—accept my sorrow, and—thy life in lieu of it. The past cannot be recalled."

"Thou sayest truly," interrupted the Earl sternly. "Man may spare life and may save it, but he cannot recall it. God only shall raise again the dead. Oh! my son, my son: darrest thou speak of him to me? Know that if it were possible, I would hate thee tenfold more because thou hast given me my life; but I cannot hate thee more!"

Sir Oliver now saw that he could never pacify the father whom he had bereaved of his son; yet did he a second time that day save the Earl from receiving a death blow. The English failed in their attempt on the castle of Stirling, and they left many of their number dead before it, but not among them were Sir Oliver de Veray or the Earl Nevil. The army of King Richard continued to waste and to burn the country, even as the Scots and the French did England. It was a sore dis-appointment to the fiery spirits which composed it, when the young king was prevailed on by the Earl of Suffolk to abandon his bold design of giving battle to the foe, and to retrace his steps homeward. Many men thought that some secret spite towards the Duke of Lancaster must have moved Michael de la Pole thus to gainsay all his schemes, and break up the whole expedition. There were many young knights impatient of this loss of honour, and much enraged at the account which the French would have to give when they should return home, of how they had been permitted to overrun the north of England, and to ruin the country; so among themselves they formed many foraging parties, and making excursions from the army, performed many brilliant deeds of valour, and took much plunder.

Sir Oliver de Veray, the further he entered England, the more he lost heart. Since the day when he had twice given the Earl Nevil his life, no words had passed between him and his enemy, for the Earl avoided him with increased care; nevertheless he seemed to relax somewhat of his rigid watchfulness as the time drew near for the execution of his purpose, which he never in any way manifested the slightest intention of relinquishing. It was told to Sir Oliver that the King had been heard to say of late, that the young knight had borne himself so gallantly in this expedition that he would

gladly have recalled the promise which the Earl had won of him, but he knew it was vain to ask him to forgive the past. Sir Oliver pondered awhile how to proceed; he had asked forgiveness of the Earl, and had been refused, and he was not fain to sue any more. At length he collected around him all the men at arms who owned his command, and rode forth resolved to find the Scots; he went to lie in ambush in a defile among the mountains of Cumberland, where it was known that they were to pass. When this came to the ears of the king, he turned to the Earl Nevil, and said:

"This will save thee and me the pains of passing judgment on the knight; he will probably perish in this adventure, for it is a foolhardy one. In good truth, Sir Earl, if he return safe, it will be through so much courage and good conduct that methinks thy wrath should no longer stand in the way of my favour."

The Earl turned very pale at this intimation.

"Justice cometh before favour, Sir," he replied, and retired from his presence as speedily as he could. Going to his own quarters, he called lustily for his arms, directed his horses to be saddled, bid all his men mount, and rode quickly forth in the same direction which Sir Oliver had taken. His kinsman, Sir Evan Cocherel, rode beside him, and thinking that he read the cause of his discomfort, he said to him, "Fear not that thou shalt lose thy revenge, for the knight hath, ere now, surely fallen." It was easy to see that this speech only caused the Earl displeasure. When they had ridden a little way, they met a horseman flying as for his life, who, when he recognised the Earl's pennon, checked his speed.

"Where goest thou, catiff?" cried the Earl, recognising in him one of Sir Oliver's train. "Dost thou forsake thy noble master?"

"My master," said the man, somewhat abashed, "hath encountered fearful odds, yet may ye arrive in time to turn the fortune of the day."

"Lead us in the road to him," said the Earl briefly, and breaking into a gallop they made their way onward. The Scots, discerning this party afar off, and knowing not what forces might be coming to the aid of those they had just fallen in with, waited not their arrival. When the Earl came up to the field of the skirmish, he cast his eye fearfully around, scarcely less anxiously than if he expected to look upon another fallen son. There was Sir Oliver outstretched on the ground, the blood welling out at more than one mortal wound. The Earl quickly distinguished him from the others that lay around, and the dying man also recognised his foe bending over him. He made an effort to speak, and spent all his remaining strength in the endeavour. Words could not force their way through his parched throat; he cast one earnest look on the Earl, asking forgiveness as plainly as speech could do;—perhaps as much for the death blow he had sought and found, as for the one he had given. With this struggle he expired. The Earl, kneeling beside him on the sward, was soon convinced that the knight would never speak nor move more—then his head sunk on his chest, and deep grief and shame overclouded his countenance. No one dared to rouse him from his moody silence. Suddenly he raised his head, and looking round to Sir Evan Cocherel, who was near at hand, he said,

"This is no more my foe, but a senseless piece of clay."

"It is much more than that," cried Sir Evan. "There lies all that remains of a true knight and a brave, who did but one ill deed, and paid dearly for it."

The Earl did not gainsay this speech, but, rising slowly and sadly from the earth, he said, "Let my followers prepare a litter of boughs, and on that we will bear him back to the camp," and, when his orders were executed, the Earl himself assisted to raise the poor mangled form, and laying it on the bier, composed the limbs, and decently covered it from sight, with a tenderness and a consideration that seemed to speak of love, not of hate.

On arriving at the camp, the Earl visited the King, and told him all that had befallen the poor young knight, Sir Oliver de Vergy. He told the tale briefly, and spoke neither of pity nor of triumph; but he demanded that the body of the knight should be left wholly in his keeping. With this request the king was very loth to comply. The Earl, seeing that he was deliberating how to refuse, spoke solemnly, and said, "Sire, neither thou nor the kinsmen of the knight shall have any cause to regret compliance with this request. Thy first promise thou canst not redeem; grant me therefore my present suit." Then the King no longer refused, only he cautioned the Earl not to forget the gentleness of knighthood. The Earl caused a coffin to be made, and therein conveyed the body of Sir Oliver to the church in which his son was buried. There laid he them side by side. Kneeling near to those graves he prayed, "Peace be to their souls," then he added, "Lord, forgive me, as I have forgiven." The Earl was a changed man since last he knelt upon that spot; then every angry and vindictive passion was at work within; now he was sad and sorrowful, and gentle withal. The outward change was also great; then was he a stern and terrible warrior; now was he a grey, broken down man. Many of his own kinsmen and of those of Sir Oliver had flocked thither, curiously to mark the manner of his proceeding, and great was the surprise which he awakened. There were many who were moved to tears. Some there were who deemed that they knew the Earl well, who thought that in spite of the tenderness he had manifested, if Sir Oliver had lived he would not have failed to bring him to justice, though they doubted not that he truly rejoiced in the removal of such a necessity. In no respect did the Earl fail to render the same honours to the remains of Sir Oliver de Vergy, as he had bestowed on his own son. When the funeral ceremony was ended, he betook himself to the church of St. John in Beverley, and demanded an interview with that same Father Philip who had received Sir Oliver into the sanctuary. He was straightway permitted to see that holy man, and he held with him a conference which endured for some hours.

No sooner was the army disbanded, and the Earl returned home, than he called his people together, and proclaimed to them his intention of proceeding forthwith on a pilgrimage to the Holy Land; and he made known to them that he went no less to implore forgiveness for his own vindictive temper, (so unmeet for the servant of Him at whose sepulchre he went to worship,) and to commend to mercy the soul of Sir Oliver, than to pray for the happiness of that son whom he so dearly loved. He therefore set his affairs in order, and took leave of the lady, his wife, the mother of young Lionel. Then went he forth to return to his home no more, for, as he retraced his steps, after the performance of the vow which held him, he sickened at Rhodes, and died there. He was known to have led a very holy life during the time of his pilgrimage, showing how truly he bewailed the pride and the errors of his former days. He surrendered his soul peacefully, believing that God, out of His grace, would show him mercy. Such was the account of him from the time of his quitting England, which was brought to the Lord Palmer, his heir, and to the Countess, by one who had shared his journeys.

FROM A PAINTING IN THE NEW WATER-COLOUR EXHIBITION, BY L. HICKS, F.R.S.

ERAS OF ENGLISH CIVILIZATION.

WHEN the naturalist looks upon an ancient oak, he perceives on its twisted branches and knotted trunk the marks of many ages; the traces of five hundred winter storms, and the memorials of as many springs. By the aid of these signs he is enabled to compose a history of the tree, and enumerate the years which have rolled away since the patriarch of the forest first rose like a tender blade of grass above the surface of the earth.

In like manner the historian of human progress—the student of mankind—sees in the visible customs of a people, and the institutions of an empire, indications of the various stages through which the nation has passed, and the successive epochs when fresh and important changes modified the whole social life of such a kingdom. All old states must exhibit, in their present condition, the various impressions stamped upon them by past ages; just as an ancient deed retains the quaint devices and old-fashioned seals of other times. Every European country bears about with it the traces of its history, and the peculiar character imparted by each bygone generation; as ancient mansions receive from each successive occupier some modification of the original buildings, by which the antiquary can trace their history from the rude fortalices of barbarous times to the noble castellated piles of the border warden.

The study of such epochs in a nation's history opens a thousand deeply interesting and grand views of man, and, like some long vista in a landscape, brings the mind into close contact with the distant and the great. This is true, whatever be the people whose history engages our attention; whether modern Turkey, or ancient Greece; for all large communities present aspects of human nature most instructive to him who, with a thoughtful and fixed intelligence, meditates thereon.

But, when England is the subject of our review, the general interest belonging to such a theme is deepened into a specially absorbing feeling, for the eras through which our land has passed are but the various stages of existence successively possessed by our own ancestors, and must therefore have for us, their children, a peculiar fascination.

If the old man delights to reflect upon the scenes of his childhood and youth, recalling with tender delight the old grove of elms with its violet banks, the mill-stream now all silent and lone, and the old parish church with its grey ivied walls; so must an old nation (that is, all its thoughtful members) feel a peculiar pleasure in reviewing the eventful stages of the past. For nations, like men, have a life which admits of such a survey; the beginnings and progress in either case being equally subjects for retrospection. If an observing man were to direct his whole attention on his past life, he would doubtless be able to recall many of the ruling events which have formed his character and made him the man he now is; such facility of retrospection in national matters is given to an Englishman by the abundance and fulness of his national annals, which are to him what memory is to the individual.

Availing ourselves of such help, let us now attempt to collect into one field of view the various eras through which England has advanced to her present position. Such a survey will not, ought not to be, a mere intellectual pastime, nor a temporary stimulus of the imagination; but a view suggesting important reflections, confirming just sentiments, and increasing the fervour of a true nationality.

The title of this paper is, "Eras of English Civilization;" and the reader may now ask, "What is the line of reflection to which my attention is summoned?" The answer may thus be given: "We intend to present the periods in which some civilizing agency has been powerfully developed on English soil; thus noting the different stages of the nation's advance, and the multi-

plied causes of the civilization now existing around us." The reader will not, of course, expect that numerous subjects can be fully discussed in a single article of a periodical like this; he must, therefore, (begging his pardon for the *must*) rest content with a sort of telescopic survey of this wide theme, comprehending the whole field of English history, and the diversified path of strife and glory along which the empire has advanced.

If some of the subjects about to be noticed appear less directly connected with "English civilization" than others, the reader will remember that the agencies of national progress are as widely ramified in their operations, and as strangely complicated in their effects, as the laws of the material universe. We shall as much as possible preserve the chronological order of the different eras, that the reader may the more easily trace the growth of the system now flourishing around him, and we therefore commence with

1. THE ERA OF FEUDALISM.

We hope no reader will be forced to ask "What is feudalism?" but, lest even one should be left in doubt, a few words must be devoted to those who are unacquainted with this ancient system. The term *feudal* is derived from an old word *feoda*, which signifies a reward, and was used to denote the consideration made to a knight or soldier for following the king to his wars. In early ages paid soldiers, men devoted to the military profession, did not exist; every owner of land was expected to be always ready to defend the state against its enemies, on which condition his lands were held. For the sake of illustration, let us suppose a person named A to receive an estate of one hundred acres from the king, on condition of giving his services for forty days every year to aid the monarch against his enemies. A is said to hold a fief, he is called a vassal, and the grantor of his estate is termed his lord. All the lands in England were thus held in the time of William I., and historians have usually applied the term *feudal* to designate the whole system. According to this scheme the king was *lord of all the land*, the possessors of estates held them from him, and those again had their own vassals, from whom they received homage and service. The reader may now ask how such a system can have contributed to the progress of civilization; for surely, he will say, the feudal system was peculiarly tyrannical, abounding in ferocious crimes and the grossest superstitions. We do not stand up as the advocates of feudalism, but, as the expounders of its results, we affirm that it promoted in some particulars the civilization of England, and that the dauntless barons of the eleventh and twelfth centuries rendered, without knowing it, great benefit to their country. One of the effects of this system was the formation of centres of power, around which the great energies of the times might develop their might. When power is dispersed into a thousand points, no channel exists through which the forces of the nation can efficiently act. Such a country resembles a steam-engine in which the power, so far from acting at fixed points, escapes from the cylinder by a hundred apertures; and, though steam may be abundant, the machine is useless for want of concentrated energy. It is invariably observed that, before a people can advance in civilization, certain reservoirs of power are created, by which the society answers the stern call of emergencies as they rise. It matters little whether such political levers are found in towns or castles; exist they must before the redemption of humanity can be disciplined to any high result. Aarchy, with its senseless tempests, overturning all things, or despotism revelling in a melancholy calm over a fettered people, must arise where no such system is found. Suppose that, in the time of John, no feudal barons had existed, that despicable monarch would have been able to oppress the land without fear of a check; for no other force could have extorted the great charter, and made Runnymede a

name of glory. Feudalism had, however, provided its strong *rallying points*, around which the national powers gathered, and restrained both the arrogance of the king, and the encroachments of the pope. No popular rising, unless guided by the heads provided by the feudal organization of the age, could have laid the secure basis upon which the noble structure of English liberties was finally raised.

The towns themselves, the homes of early civilization, were nourished by feudalism until sufficiently strong to dispense with its aid; for beneath the shelter of the baronial fortalice the humble villa¹ first arose, and subsequently expanded into populous cities, independent boroughs, and flourishing market towns. Some may object that the feudal nobles were often the greatest oppressors of the towns, and the tyrants of the people; but the *general fact*, that the burghs first grew up under feudal protection, is not overturned by special cases of local rapacity. Nothing is clearer in the *earlier* part of the Middle Ages than the eagerness of individuals and communities to place themselves under the protection of a powerful superior, whose aid they might invoke against all spoilers. Thus vassalage was voluntarily sought for the sake of the security rendered by the baron to his dependant. A system of *mutual service* then arose, the lord engaging to protect, the vassal promising to serve; which bound up in one great organization the mass of the people, and prepared them for the subsequent stages of an illustrious progress. What could have secured such a result in a half civilized age but the solemnities and oaths of the feudal homage, which created a species of relationship between the tenant and the lord? That feudalism was accompanied by grievous evils is admitted, but let us not forget amid its dark points the ameliorating results of its far extended agency. The Egyptian would be deemed unreasonable who should be solely intent on the mischiefs produced by the flooding of the Nile, and forget the fertilizing effects of the inundation. Somewhat similar are sweeping and unqualified condemnations of the whole feudal system, by men who forget the various agencies required by the diverse conditions of widely separated ages. Such a system would now be a calamity; once it wrought effectually for good, and must therefore be classed with the causes which have promoted the civilization of England. This will be further evident, when we consider how much of our national improvement is traceable to that early elevation of women in the social system produced by the knightly spirit of the feudal era, which, though it occasionally wandered into the absurdities of a wild romance, fostered that female dignity which it so well appreciated. Such a result would of itself entitle feudalism to rank as one of the eras of English civilization, and exhibits an attractive oasis in the long waste of ancient barbarism.

2. THE ERA OF THE CRUSADES.

The above considerations on the influence of the feudal system, naturally lead us to contemplate the consequences of those singular wars, which combined in so remarkable a degree the spirit of chivalry with that of religion, and arrayed the knight with the pilgrim in the serried ranks of war. Were not the crusades a barbarous and useless expenditure of life, and did they not spread desolation over some of the fairest regions of Europe and Asia? A very natural question is this for him to propose who has just read some account of the ravages perpetrated by the half-armed, ill-disciplined, and starving hordes, whom a wild enthusiasm carried from the extremes of Western Europe to the plains of Palestine. To vindicate these wars is not our object, but simply to ascertain their effects on the civilization of England, all other subjects being left to the imagination, or the investigation of the reader. How did the crusades aid the advance of England in power, refinement, or wealth? In the first place, they

forced the land from her isolated state of a spectator on the frontiers of Europe, into the activities of an enlarged intercourse with distant countries. Before these wars drew the lord from his castle, the peasant from his hut, the burgher from his tithing, and the monk from his convent, England knew little of the world beyond her narrow seas, save some stormy acquaintance and suspicious dialogues with her neighbour France. Now and then a pilgrim returned from the Holy Land, after years of suffering, to startle the wondering burghers, or the amazed knight, by descriptions of the mysterious East, and the woful condition of the Holy City. But, when thousands marched under the banners of *Cœur de Lion*, and joined with French, German, and Italians, in the grand onset, which swept for a time the hordes of Asia before the lances of Europe, a wide world was opened to the view of our ancestors, which necessarily introduced many ideas and habits before unknown. In this respect, the crusades were a valuable school for insulated Britain, bringing her into communion with the whole of Christendom, and expanding the minds of her nobles and clergy with the literature and knowledge of distant lands.

Another result flowing from the crusades, was that re-distribution of landed property which produced a vast change in the condition of England, and prepared the way for further beneficial alterations. When the centres of power, provided by the feudal system, had done their appointed work, and organized the national resources, it became necessary to permit the increase of other principles, which might act as a counterpoise to the undue powers of the baronial order. But how could another class of interests be raised as an antagonist to the feudal, whilst the victors of Hastings held their domains and strong fortresses? The towns could not accomplish this, for they were the pupils, not as yet the rivals, of the castles; nor did any mercantile order exist possessed of an influence fitted to cope with, or check the pride of, territorial power. The kings were also weak, and in many cases inferior in resources to the great nobles, who yielded but a reluctant homage to fictitious potentates. In the preceding section, we have represented feudalism as a civilizing agent, but this was only the case until it had formed centres of power; after this, a check was required to prevent the growth of evils natural to the system of the sword. It was necessary that the *people and the crown* should receive an increase of privileges at the expense of the castle. The knightly lance had undoubtedly wrought some glorious deeds for the land, but that same lance must be watched, or it may soon be pointed against the very persons it has protected. But who shall diminish the might of the baron,—who lower his pennon, or rein the wild spirits in the train of feudalism? The crusades accomplished this. Did the baron wish to join the host about to depart for Palestine,—did he listen with glowing soul to the loud call of his compatriots, and desire to bear for his escutcheon the famed red cross? He must first part with his broad lands to procure money for such a voyage; neither Venetian nor Genoese fleets¹ will transport the bold crusader for nought, nor can enthusiasm of the loftiest order hope to be fed by miracles in the Eastern deserts. The lands won at Hastings were therefore sold, or left as pledges, till the bold crusader returned laden with the spoils of the East. To whom did these estates pass? Probably to the king, delighted at the prospect of freedom from the over-awing presence of powerful peers; or to some merchant, who thus raised his family to the rank of the old territorial lords. The once proud possessor of a wide domain often perished in the Holy Land, or returned with the loss of all his treasures to behold his broad lands in the possession of another. The case we have just imagined illustrates the trans-

(1) The sea ports of the Italian States, especially Venice and Genoa, furnished most of the ships used for transporting various crusading armies to Palestine.

(1) *Vill* is the old word for a town.

fers of property, and therefore of influence, produced in numberless instances by the crusades. Such changes increased the power of the crown, producing a *new centre of power*, still more favourable to civilization than those created by feudalism; or they raised the merchants to a rank which the possession of land could alone confer in those times. The towns were freed from the interference of the barons, or purchased valuable privileges with the money required to conduct a crusading band to the walls of Jerusalem, or the ramparts of Acre. Thus, amid the struggles of Europe and Asia, the ruin of mighty armies, and the sufferings of millions, the agencies of civilization were working deeply in the system of English society. Little did Saladin think, when his forces were crushed on the field of Ascalon by the mailed chivalry of England, that the *absence* of those fierce warriors was working such future good for the distant isle of the West; we must not, however, forget the wide and lasting effect of these memorable expeditions on the civilization of our land.

3. ERA OF THE ORIGIN OF THE ENGLISH PARLIAMENT.

We now turn from embattled hosts in Syria to the agitations of society in the burghs and shires of England during the thirteenth century. What stirring associations rise at the sound of thy name, Old Simon de Montfort! The idliest schoolboy often makes a pause in the hurried mechanical reading of his lesson in "Goldsmith," when told that with this man the British Parliament began. We think of him whilst passing in front of the stately edifice rising with imperial magnificence on the banks of the Thames, and throwing into shade the old Abbey and the Hall of Rufus. We do not pause to determine whether he should be called a political schemer, a daring rebel, or a bold patriot; it is enough that many ages have ascribed to the French noble the beginning of an institution which has found on English soil an immovable foundation. Magna Charta itself loses some of its glory when compared with the memorable event, which shall preserve through all ages the name of *Simon de Montfort*. His fate on the field of Evesham, when crushed by vastly superior forces, may not have been unmerited; but the peers and commons of England are not disposed to criticise the man whose boldness made a golden calendar for England.¹ The reader will, perhaps, pardon us for not plunging into the vexatious question respecting the exact year or day when the representatives of counties, cities, and boroughs sat in full parliament assembled. The representative system may doubtless be traced to periods before the age of De Montfort in England, but must certainly be regarded as the originator of our parliaments in the full sense of the term.

From this era we see another *centre of power* in operation, more powerful than aught provided by feudalism, as it concentrated the *whole* of the national energies. That the age marked by the origin of our parliament must be classed with the eras of English civilization, will be at once admitted by all Englishmen, from the highest person in the realm to the peasant who handles the plough, unless ignorance of so great a fact may excuse any of the latter from the least reflection on such a subject. What a view does the history of the British parliament present, since the gushing forth of the springs in the thirteenth century. Little did some rate its influence, as, for a long period, it ran through sluggish regions, now pent up by the adamantine walls of the baronial fortress, now turned aside by some vast obstacle raised against its current by the crown. Sometimes it bore along the bark of

despotism instead of the ark of freedom; but yet the waters were not dried up, on they rolled, whilst the wars of the Roses raged—on they sped, deepening and expanding, by the Tudor and Stuart strongholds, and now present a glorious spectacle of quiet power to the nations.

(To be continued.)

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SORROWS.¹

CHAP. VIII.

THE MIDDLE SOLVED.

UPON what trifles do the most important events of our lives turn! Had I quitted the room according to my intention, I should not have had an opportunity of seeing Miss Saville alone again, as she returned to Barstone that afternoon, in which case she would probably have forgotten, or felt afraid to avail herself of my promised assistance, all communication between us would have ceased, and the deep interest I felt in her, having nothing wherewith to sustain itself, would, as years passed by, have died a natural death.

Good resolutions are, however, proverbially fragile, and, in nine cases out of ten, appear made, like children's toys, only to be broken. Certain it is, that in the present instance, mine were rendered of none avail, and, for any good effect that they produced, might as well never have been formed.

As I got up to leave the room, Miss Saville rose likewise, and in doing so, accidentally dropped a or rather *the* letter, which I picked up, and was about to return to her, when suddenly my eye fell upon the direction, and I started as I recognised the writing—a second glance served to convince me that I had not been mistaken, for the hand was a very peculiar one; and, turning to my astonished companion, I exclaimed, "Clara, as you would avoid a life of misery, tell me by what right this man dares to address you!"

"What! do you know him, then?" she inquired, anxiously.

"If he be the man I mean," was my answer, "I know him but too well, and he is the only human being I both dislike and despise. Was not that letter written by Richard Cumberland?"

"Yes; that is his hateful name," she replied, shuddering while she spoke, as at the aspect of some loathsome thing; then, suddenly changing her tone to one of the most passionate entreaty, she exclaimed,

"Oh! Mr. Fairleigh, only save me from him, and I will bless you, will pray for you!" and completely overcome by her emotion, she sank backwards, and would have fallen, had not I supported her.

There is a sort of feeling which a man experiences when he has bravely resisted some hydra-headed temptation to do anything "pleasant but wrong;" or, at all events, highly inexpedient, yet which circumstances appear determined to force upon him; he struggles against it boldly at first; but, as each victory serves only to lessen his own strength, while that of the enemy continues unimpaired, he tells himself that it is useless to contend longer—that the monster is too strong for him, and he yields at last, from an impulse of fatalism and despair—a sort of "have-it-your-own-way-then" frame of mind, which seeks to relieve itself from all responsibility, by throwing the burden on things in general—the weakness of human nature—the force of circumstances—or any other indefinite and conventional scape-goat, which may serve his purpose of self-exculpation.

In much such a condition did I now find myself; I felt that I was regularly done for—completely taken

(1) This celebrated earl was a younger son of the Count de Montfort, the leader of the barbarous crusade against the Albigenses. He married the Princess Eleanor, and thus became connected with the royal family of England.

(2) The reverence with which the great earl's memory was long cherished, may be estimated from the popular name, "Sir Simon the Righteous," long given to him, in spite of his foes.

by storm—and that nothing was left for me but to yield to my destiny with the best grace I could. I, therefore, seated myself by Miss Saville on the sofa, and whispered, "You must promise me one thing more, Clara, dearest—say that you will love me—give me but that right to watch over you—to protect you, and believe me, neither Cumberland, nor any other villain, shall dare for the future to molest you."

As she made no answer, but remained with her eyes fixed on the ground, while the tears stole slowly down her cheeks, I continued—"You own that you are unhappy—that you have none to love you—none on whom you can rely;—do not then reject the tender, the devoted affection of one who would live but to protect you from the slightest breath of sorrow—would gladly die, if, by so doing, he could secure your happiness."

"Oh! hush, hush!" she replied starting, as if for the first time aware of the tenour of my words; "you know not what you ask; or even you, kind, noble, generous, as you are, would not seek to link your fate with one so utterly wretched, so marked out for misfortune as myself. Stay," she continued, seeing that I was about to speak, "hear me out. Richard Cumberland, the man whom you despise, and whom I hate only less than I fear, that man have I promised to marry, and, ere this, he is on his road hither to claim the fulfilment of the engagement."

"Promised to marry Cumberland!" repeated I, mechanically, "a low, dissipated swindler—a common cheat, for I can call him nothing better; oh, it's impossible!—why, Mr. Vernon, your Guardian, would never permit it."

"My Guardian!" she replied, in a tone of the most cutting irony; "were it not for him this engagement would never have been formed; were it not for him I should even now hope to find some means of prevailing upon this man to relinquish it, and set me free; Richard Cumberland is Mr. Vernon's nephew, and the dearest wish of his heart is to see us united."

"He never shall see it while I live to prevent it!" replied I, springing to my feet, and pacing the room with angry strides. "Oh, it was all plain to me now! when I had fancied her guardian's features were not unfamiliar to me, it was his likeness to Cumberland which had deceived me: his rudeness on the night of the ball; the strange dislike he appeared to feel towards me;—all was now accounted for. His opinion of me, formed from Cumberland's report, was not likely to be a very favourable one; and this precious uncle and nephew were linked in a scheme to destroy the happiness of the sweetest girl living, the brightness of whose young spirit was already darkened by the shade of their vile machinations; but they had not as yet succeeded; and if the most strenuous and unceasing exertions on my part could serve to prevent it, I inwardly vowed they never should. Let Master Richard Cumberland look to himself; I had foiled him once, and it would go hard with me but I should do so again."

Having half thought half uttered the foregoing resolutions, I once more turned towards Miss Saville, who sat watching me with looks of interest and surprise, and said, "This is a most strange and unexpected affair; but, remember, Clara, you have appealed to me to save you from Cumberland, and to enable me to do so, you must tell me exactly how matters stand between you, and, above all, how, and why, you were induced to enter into this engagement, for I hope—I think—I am right in supposing—that affection for him had nothing to do with it."

"Affection!" she replied, in a tone of voice which, if any doubts still lingered in my mind, effectually dispelled them; "have I not already said that I hate this man as, I fear, it is sinful to hate any human being? I disliked and dreaded him when we were boy and girl together, and these feelings have gone on increasing year by year, till my aversion to him has become one of the most deeply-rooted instincts of my nature."

"And yet you allowed yourself to be engaged to him?" inquired I. "How could this have been brought about?"

"You may well ask," was the reply; "it was folly; it was weakness; but I was very young,—a mere child in fact; and they made me believe that it was my duty: then I hoped, I felt sure, that I should die before the time arrived to fulfil the engagement; I fancied it was impossible to be so miserable, and yet to live; but Death is very cruel—he will not come to those who pine for him."

"Clara," interrupted I, "I cannot bear to hear you say such things; it is not right to give way to these feelings of despair."

"Is it wrong for the unhappy to wish to die?" she asked, with a calm child-like simplicity, which was most touching. "I suppose it is," she continued, "for I have prayed for death so often, that God would have granted my prayer had it been a right one. When I closed my eyes last night, oh! how I hoped—how I longed—never to open them again in this miserable world,—for I felt that evil was at hand; you laughed at my presentiment; it has come true, you see."

"Believe me, you do wrong in giving way to these despairing thoughts—in encouraging these morbid fancies," returned I. "But time presses; will you not tell me the particulars of this unhappy engagement, that I may see how far you stand committed to this fellow Cumberland, and decide what is best to be done for the future."

"It is a long story," she replied, "but I will tell it you as shortly as I can."

She then proceeded to inform me that her mother having died when she was an infant, she became the idol of her surviving parent, who, inconsolable for the loss of his wife, lavished all his tenderness upon his little girl. She described her childhood as the happiest part of her life, although it must have been happiness of a tranquil nature, differing greatly from the boisterous merriment of children in general; its chief ingredient being the strong affection which existed between her father and herself. The only guest who ever appeared at the Priory, (which I now for the first time learned had been the property of Sir Henry Saville,) was his early friend Mr. Vernon, who used periodically to visit them, an event to which she always looked forward with pleasure, not so much on account of the presents and caresses he bestowed on herself, as that his society appeared to amuse and interest her father. On one of those occasions, when she was about nine years of age, Mr. Vernon was accompanied by a lad some years older than herself, whom he introduced as his nephew. During his visit, the boy, who appeared gifted with tact and cunning beyond his years, contrived so much to ingratiate himself with Sir Henry Saville, that, before he left the Priory, his host, who had himself served with distinction in the Peninsula, expressed his readiness to send him, on attaining a fit age, to one of the military colleges, promising to use his interest at the Horse Guards to procure a commission for him. These kind intentions, however, were fated not to be carried out. An old wound which Sir Henry had received at Vimiera broke out afresh, occasioning the rupture of a vessel on the lungs, and in the course of a few hours Clara was left fatherless. On examining the private papers of the deceased, it appeared that Mr. Vernon was constituted sole executor, trustee for the property, and guardian to the young lady. In these various capacities, he immediately took up his residence at Barstone, and assumed the direction of everything. And now for the first time did his true character appear—sullen and morose in temper, stern and inflexible in disposition, cold and reserved in manner, implacable when offended, requiring implicit obedience to his commands, he seemed calculated to inspire fear instead of love, aversion rather than esteem. The only sign of feeling he ever showed was in his behaviour towards Richard Cumberland, for

whom he evidently entertained a strong affection. The idea of a military career having been abandoned at Sir Henry Saville's death, much of his time was now spent at the Priory. Although he was apparently fond of his little companion, and endeavoured on every occasion to render himself agreeable to her, all his habitual cunning could not conceal from her his vile temper, or the unscrupulous means of which he was always willing to avail himself in order to attain his own ends. He had been away from the Priory on one occasion more than a year, when he suddenly returned with his uncle, who had been in town on business. He appeared sullen and uncomfortable, and she imagined that they must have had a quarrel. She was at that time nearly fifteen, and the marked devotion which Cumberland (who during his absence had greatly improved both in manner and appearance) now paid her flattered and pleased her; and, partly for this reason, partly because she had already learned to dread his outbreaks of temper, and was unwilling to do anything which might provoke one of them, she allowed him to continue his attentions unrepulsed. This went on for some weeks, and her old dislike was beginning to return as she saw more of her companion, when one morning Mr. Vernon called her into his study, and informed her that he considered she had arrived at an age when it was right that she should become aware of the arrangements he had made for her, in accordance with the wishes of her late father. He then showed her a letter in Sir Henry Saville's handwriting, dated only a few weeks before his death, part of which was to the following effect:—"You urge the fact of your nephew's residing with you as an objection to my scheme for your living at Barstone, and assuming the guardianship of my daughter, in the event (which, if I may trust my own sensations, is not very far distant) of her being left an orphan. From what I have seen of the boy, as well as on the score of our old friendship, my dear Vernon, that which you view as an objection, I consider but an additional reason why the arrangement should take place. A marriage with your nephew would ensure my child (who as my sole heiress will be possessed of considerable wealth) from that worst of all fates, falling a prey to some needy fortune-hunter; and, should such a union ever take place, let me beg of you to remember, and to impress upon Clara herself, that had I lived it would have met with my warmest approbation."

Having shown her this letter, Mr. Vernon went on to say that he had noticed with pleasure Richard's growing attachment, and the marked encouragement she had given him, and that, although they were too young to think of marrying for some years, and as a general principle he was averse to long engagements, yet, under the peculiar circumstances in which they were placed, he had yielded to his nephew's importunity, and determined not only to lay his offer before her, but to allow her to accept it at once, if (as from her manner he could scarcely be mistaken in supposing) her inclinations were in accordance with his.

Taken completely by surprise at this announcement, overpowered by the idea that by the encouragement she had given Cumberland she had irretrievably committed herself—strongly affected by her father's letter—having no one to advise her, what wonder that the persuasions of the nephew, backed by the authority of the uncle, prevailed over her youth and inexperience, and that the matter ended in her allowing herself to be formally engaged to Richard Cumberland.

Little more remained for her to tell; reckoning that he had gained his point, Cumberland became less careful in concealing the evil of his disposition, and her dislike and fear of him increased every day. At length this became evident to Mr. Vernon, but it appeared only to render him still more determined to bring about the match, and when once, nearly a twelvemonth before, she had implored him to allow her to break off the engagement, he had exhibited so much violence, declaring that he possessed the power of rendering her a beggar,

and even threatening to turn her out of doors, that she had never dared to recur to the subject again. For many months, however, she had seen nothing of her persecutor, and she had almost begun to hope that something had rendered him averse to the match, when all her fears were again aroused by a hint which Mr. Vernon had thrown out as he took leave of her at Mrs. Coleman's, desiring her to exercise great circumspection in her behaviour, and to recollect that she was under a solemn engagement, which she might before long be called upon to fulfil. The letter from Cumberland, she added, spoke of his immediate return to claim her hand, and a few lines from Mr. Vernon ordered her to await their arrival at Barstone.

"And now," she continued, looking up with that calm hopeless smile which it always pained me to behold, "have I not cause to be unhappy, and was I not right in telling you that no one could be of any assistance to me, or afford me help?"

"No!" replied I warmly, "I trust and believe that much may be done—nay, every thing; but you are unequal to contend with these men alone; only allow me to hope that my affection is not utterly distasteful to you. Would you but give me that right to interfere in your behalf!"

"This is unkind—unlike yourself," she interrupted. "Have you already forgotten that I am the promised bride of Richard Cumberland? Were I free, indeed—"

"Oh! why do you pause?" exclaimed I passionately. "Clara, hear me—you deem it ungenerous in me to urge my suit upon you at this moment—perhaps think that I would take advantage of the difficulties which surround you, to induce you to promise me your hand as the price of my assistance. It is true that I love you deeply, devotedly, and the happiness of my whole life is centred in the hope of one day calling you my own; but I would use my utmost endeavours to save you from Cumberland, even though I knew that by so doing I forfeited all chance of ever seeing you again. Tell me, would you wish this to be so—am I to believe that you dislike me?"

As she made no reply, merely blushing deeply, and casting down her eyes, I ventured to continue. "Clara, dearest Clara, do you then love me?"

Well, reader, I think I've told you quite as much about it as you have any business to know. Of course she did not say she loved me; women never do upon such occasions; but I was just as well contented as it was. Mendelssohn has published songs without words, (*Lieder ohne Worte*), which tell their own tale very prettily, and there have been many eloquent speeches made on a like silent system. Suffice it to add, that the next ten minutes formed such a nice, bright, sunshiny little piece of existence as might deserve to be cut out of the book of time, and framed, glazed, and hung up for the inspection of all true lovers; whilst no match-making mamma, fortune-hunting younger brother, or girl of business on the look-out for a good establishment, should be allowed a glimpse of it at any price.

NUREMBERG.

Of all hobbies, (and I agree with Sterne that there is no true Englishman who does not bestride a favourite animal of this Utopian genus,) that of the antiquarian, and the lover of the olden time, seems to me the preferable; it is economical in its keep, easy in its motions, and, above all, is generally contented to jog on quietly by itself, without interfering with others, which is a great deal more than can be said of many hobbies I could name;—for the great evil of this species of equitation is, not the harm which it does one's self, but the annoyance which in most cases you occasion to your neighbours. For instance, there is the educational hobby,

which rides roughshod over parish schoolmasters, and little children at home for the holidays; then there is the agricultural hobby, much beloved by country gentlemen, with which I have often been pestered till bone dust, guano, and chemical manure literally stunk in my nostrils; worst of all, perhaps, is the politico-economical, especially when ridden by a female. I would take the most placid man in the universe, after a good dinner, when he has been soothed down to an even uncommon state of benevolence, and be content to lose any reasonable bet, if he is not lashed into uncontrollable fury by an hour's companionship with the celebrated Miss Tartarreau, when she is going at an easy canter through Adam Smith at the rate of five pages per minute. Besides these, there are the universal-improvement, the political, the scientific hobbies, and many others, all equally disagreeable to every one but the rider. But the antiquarian hobby, on the other hand, is a quiet, retiring creature, which ambles slowly along, injuring and annoying nobody; as it lags behind the other steeds, it requires no support from, and never interferes with them; for indeed it is not a creature of progress, but modestly picks up and cherishes the refuse which others throw away—thus resembling the innocuous rag-gatherer, who collects the fragments of your cast-off garb, silently, and without troubling you; whilst the riders of newer systems may rather be likened to those puffers of novelty, who are always pestering you with hand-bills, and hawling out to you to "Reform your Tailors' Bills." For my part, I confess that I give in to this respect for antiquity, and have a sneaking fondness for everything that is old—old wine, old books, old friends, old houses, and even old women when they are not of the male sex. I cannot help thinking that they had a something of good, and pleasant, and respectable about them, which we in our newness have lost, or have not yet attained to. Such being my sentiments, it was with anticipations of great delight that I entered Nuremberg, which is the oldest city *de facto* now inhabited in Europe. When I say this, I of course do not mean that the date of its erection reaches farther back than Rome, or even London, but that it contains in fuller perfection the appearance and the essence of what it was centuries ago, than any other city;—others have changed, it has remained the same, in its outward aspect, and even to a great extent in the habits and feelings of its inhabitants. And the antiquity, which is enshrined here, is presented in a phase peculiarly favourable to the wry-necked theories of the lovers of the old: for, if I may pursue the somewhat threadbare figure of the hobby-horse, the antiquarian's steed has this peculiarity, that, tractable as it generally is, it occasionally meets with objects which cause it to shy and stumble, so as to bring both hobby and rider, in a most humiliating manner, to the ground. Thus it must have happened to every one, when praising the ecstatic beatitude of the good old times, and comparing, with indignant regret, this high-pressure era of steam engines and railway scrip, and shirts made at three-halfpence a-piece, with that delightful age shadowed out in our golden dreams—

"When every day was holiday,
And every month was fruitful May,—"

to have some stubborn fact thrown in one's teeth, such as that of people roasted at slow fires for holding unfashionable opinions, or of lovely ladies wearing like troopers, and taking ale and strong waters for breakfast, instead of the ethereal elements of tea and coffee. This is the sort of thing which makes your hobby wince, bringing you down at once from your high and graceful seat, to a most uncomfortable doubt, whether those people were really so much more fascinating, poetical, and romantic than our own, or the times in which they lived so far surpassed ours in elegance, in delight, and elevation of feeling. But the best of Nuremberg is, that you are not liable to meet with these shocks in con-

sidering its former days of palmy greatness; for its life was not that of the knights and high-born dames in connexion with whom anything common and vulgar becomes a desecration, but that of the sturdy, grotesque old burghers, which can bear a good deal of scrutiny without damage; for one does not require them to be poetical and chivalrous, but simply jovial, comfortable, and quaint; and these qualities, unlike the romantic attributes, one finds realised on inquiry, just as the massive monstrosities, which deck the walls of a gothic building, remain long after the delicate but fragile tracery has disappeared. In fact, this one word *quaint* exactly expresses the character of the town and of its inhabitants, both past and present; at the same time, it is a quaintness most closely combined with beauty, or rather picturesqueness, if there be a difference between the two things, which I leave to wiser heads than mine to determine. This is, however, the idea which Nuremberg gives you at first sight, and which remains with you; that it is thoroughly quaint, and thoroughly picturesque. Such it was, and such it remains: its people take an excessive pride in keeping up everything in their city in the same character which it originally bore, and show a degree of interest in all the remnants of antiquity, which we might consider wonderful, were it not explained by the fact, that the inhabitants themselves, saving their dress, are as quaint and old-fashioned as the buildings. Indeed, you see nothing to remind you of the lapse of time; you walk really and truly amidst the old burgher life of mediæval Germany; and, as you wander amidst houses and gateways of the fifteenth century, you could almost point out the identical Hans Foltz who shaved the good burgomaster in the legend, and the drinking cellar where Sachs chanted his jovial anathemas against priestcraft.

Nuremberg was, in its day, which extended from the fourteenth to the end of the seventeenth century, the richest and most powerful of the free cities of the empire. These small but important republics very much resembled, in spirit and constitution, the commercial states which flourished in Italy about the same period, and Nuremberg was perhaps the most perfect specimen of its class; it was the Venice of Germany. Its merchants were princes; its nobles rivalled the haughty feudatories of the land; and its wealth, and the numerous bands of sturdy burghers which it could raise, gave it an influential voice in the councils of the empire. As Venice was the great emporium for the traffic between East and West, so Nuremberg was the centre through which flowed all the commerce from North to South; nor were its inhabitants contented with being carriers alone, they engaged in the work of production on their own account, and for centuries the manufactures of Nuremberg were celebrated throughout Europe. These manufactures were of all kinds, from the massive labours of the smith, to the ingenious niceties of the mechanician; every one has heard that watches were first invented here, and were originally styled "Nuremberg eggs," and has played in his time with Nuremberg toys. The wealth which the citizens collected in this way appears, on the whole, to have been very well laid out; that is to say, they built hospitals and churches, and uncommonly comfortable houses for themselves; and, more than this, they encouraged the fine arts, so that, as the Italian literature and art flourished under the merchant princes of Florence and Venice, the significance of the burghers of Nuremberg produced a new era in the poetry and painting of Germany. Nor did they become enervated by prosperity, but retained all along the same bold and independent spirit. Indeed, for that matter, they were kept in pretty good practice, being almost always at feud with the hereditary governor, who claimed rights which the citizens were not at all disposed to acquiesce in; and, besides, they required to defend their territories and their merchandise against the encroachments of the neighbouring princes. In the end, it was war which ruined them, for the Ger-

mans date the decline of the city from that valorous defence which it made, when Wallenstein, having determined to play over again Tilly's sack of Magdeburg, was frustrated in his design by the valour of Gustavus Adolphus and the citizens. Neither party, however, had much to boast of from the results of this encounter, and the city suffered the most; its finances were exhausted, its trade crippled, and this blow concurring with the alteration in the direction of traffic, produced by the discovery of the Cape of Good Hope passage, Nuremberg gradually sunk in importance, till it finally lost its character of an independent city, and was made over by Napoleon, in his cool way, to Bavaria, to which kingdom it still belongs. Its trade, however, is now increasing again,—its manufactures are rising in demand,—and certainly there is no appearance of stagnation in the general aspect of the city, but an air of liveliness and business which promises well for the future.

But come, this is a very slow way of going about our work; we shall never get a proper idea of Nuremberg if we prose on in this style. The worst of being only a day or two instead of as many months, as you might well wish to be, in such a place as this, is, that one is obliged to be content with trotting methodically after a commissioner to see the sights, as he lays them out, after all seeing nothing as it should be seen. The proper way to understand such a town as Nuremberg is, to start by yourself, after a good breakfast, with your hands in your pockets, a cigar in your mouth, and your thoughts sunk into that state of partial *coma* which is generally styled day-dreaming. Thus accoutred, saunter carelessly along, turn up one street, and down another, as inclination prompts; stare into a shop here, enter a church there; further on, drop into one of the popular beer-houses, and refresh your faculties with a foaming glass, striving all the time to imagine yourself your great-great-grandfather, and you will get a better notion of the place than if you followed every footstep of your guide as intently as an Indian on the trail, and measured every yard by a tour book. Come, then, we will start on this principle, and try if we cannot manage a pleasant walk through Nuremberg.

You are astonished, I have no doubt, at the spaciousness and handsome appearance of the streets; considering the age at which the town was built, you expected to see narrow, confined lanes, which one could shake hands across, and you find broad thoroughfares, somewhat crooked and rambling certainly, but more roomy and capacious than almost any street which London could boast thirty years ago. As to their really possessing the antiquity which they claim, you can be under no difficulty, if you only look at the houses, scarcely one less than two or three hundred years old; and then, what a strange mixture they present of oddity and beauty,—of substantial comfort and grotesque adornment! The walls of massive stone, and the windows small, characteristic of the times when strength was needed as much for defence as durability; all with the gables turned to the street, so that even the largest, which contain perhaps two or three separate courts, make a comparatively modest show; the red-tiled roofs, invariably higher than the sides of the houses, so that where you see, may be, two rows of windows in the wall, there shall be five or six in the roof, as if the inhabitants, being mostly poets, had considered it necessary to keep up the etiquette of their calling by living in garrets; whilst, as if the overgrown shelving roofs were not high or huge enough to please the most aspiring genius, many of them are crowned with strange ragged-looking towers and spires, which seem so completely useless and out of place in their present situation, that you cannot account for their being there otherwise than by supposing that they have strayed from some of the neighbouring churches, and, having got drunk, have been unable to find their way home, and so perched where they best could.

The very walls present effects which you would consider curious enough elsewhere; they are painted of all the colours of the rainbow, and without any regard to regularity, so that in one street you have red and green houses, blue, white, and yellow, whilst many still exhibit the remains of the paintings in fresco with which they were once covered; here you see is a group of angels, there a Madonna, or some more heathen portraiture; now some mathematical hallucinations, and then a veritable elephant and castle, really a most respectable specimen of the artist's knowledge of natural history—moreover, the windows are almost universally of that beautiful oriel form, so admirably adapted for stolen glances, which one sees in the older pictures, and profusely adorned with the richest and most fantastic tracery. These are the mansions of the burghers of Nuremberg, and, seeing what they were or are, one cannot much wonder at the exclamation of that gossiping old pope, Pius II., when he said, that the Kings of Scotland were not so well lodged as a simple citizen of the free city. This air of splendour, however, and even of gaiety and liveliness, is not, as one might consider it would necessarily be, at all inconsistent with the antique appearance of the whole—on the contrary, the first thing which strikes one is the extremely old-fashioned look of every thing, and its utter dissimilarity to anything you have ever seen except in vision, so that, in truth, after wandering about for a day or two amidst these living wrecks of the past, you fall into a sort of mazy dream, and begin to doubt the truth of your long-accepted chronology; nor does that story seem very improbable of the antiquary who, being conveyed in a state of vinous abstraction into Nuremberg, declared when aroused, that he had been dreaming that he lived in the nineteenth century, and was delighted to be awakened to the reality of his existence in the fifteenth.

As you wish to have a general view of the whole town, we had better climb this gentle ascent to the Burg or citadel, that ancient fortress where the emperors used to keep their crown jewels, and where you may still see the double eagle painted on the gate, in memory of the days when Nuremberg was an imperial city.—It is a plain enough collection of towers and bastions of no strength at present, and not much more interest, the only parts which can boast of very great antiquity being two towers, one of a pentagonal form, and the other adorned with some hideous figures, which having been supposed to represent idols, have given it the name of the Heidenthurm (Heathen-tower). The inside of the castle, too, has as few attractions, these being limited to some commonplace pictures, which unfortunately are not things of such scarcity that we need go to Nuremberg to see them. There is, however, in the court yard a fine elm tree, as aged and little more ruined than the building itself, which is said to have been planted by the Empress Cunegunda, wife of Henry III. If this be the case, it must be full seven hundred years old, and has seen a good many changes in the course of its life. There is also a common enough statue of Gustavus Adolphus, of coarse stone, which is interesting to those who uphold the theory of races. It is scrawled over with names of tourists, in German characters, thus showing the affinity in a striking characteristic of our own nation to the Germans. I had thought before I saw this, that the passion for memorializing oneself by mischief had been peculiar to the Anglo-Saxon branch, but it would appear to be common to the whole Teutonic stock.

The view from this eminence gives you the whole town. The country around is flat, with undulations. In the distance are the heights on which Wallenstein lay with his mighty army, and to the right are the pretty beer gardens and pleasure grounds of the citizens. At your feet you can trace the circuit of those massive fortifications which were once the wonder of Germany, but now lie broken, dismantled, and useless; of the three hundred and sixty-five towers which it once boasted, there

remain but four, at the principal gates, but these are huge Cyclopean structures, which look as if they might stand to eternity. Within the enclosure of these walls lies the town, divided into almost equal portions by the little stream of the Pegnitz, with its numerous bridges, and looking, with its red roofs, the very picture of antiquity. Indeed, these red tiles are one of the most characteristic features of Nuremberg, and contribute, more than anything else, to the peculiarity of its appearance; they are burnt of a deep bright scarlet, and every building in the town is covered with them, from the poorest house to the finest church. But of all the buildings, high or low, there is none which is regarded with more respect by the genuine Nurembergers, than the dark-looking house with the projecting roof, and overhanging gallery of wood, which you see in the hollow yonder. That was the dwelling of Albert Dürer, the German Raphael; and there is a stone figure of him over the doorway, which you cannot see from this—it now belongs to the Society of Artists. But let us go now to the square or *Place* named after Dürer, and we shall there see his statue by Rauch, the second of German sculptors, second only to Schwanthaler. There the painter stands, pencil in hand, calm but noble-minded, and energetic as he lived; you can read the man's genius on his brow at the first glance. It is, indeed, a splendid statue, simple but full of life, classical to nicety, and yet preserving all the Gothic character. It is coloured so as to have the appearance of extreme age, in order to assimilate it to the surrounding buildings, and not the least part of the artist's triumph consists in his having given this appearance most perfectly without in the least derogating from beauty. To look at the figure you would say, that two hundred years must have passed since it was erected, and wonder that there should have been such statues in those days. After all, there are some things in which the Germans beat us, although they do not understand the building of steam engines, or jobbing in railway shares.

I do not at all wonder at the adoration which is paid to Dürer in his own country—to me he is the most delightful of all painters, for this reason, that there is no artist whose pictures you so thoroughly enter into, or which impress themselves so indelibly on your memory. Complaints indeed are made of the severity and linear distinctness of his outline, which undoubtedly have some foundation in fact, but I cannot see the objection to these peculiarities, unless where they detract from the freedom and life of the whole; with Dürer this is not the case. There is no artist who has less formality, or, when the subject requires it, more ease and graceful vivacity, whilst the very marked outline produces a strength and reality seldom seen. In one word, he possesses all the virtues, and none of the failings of the German school, and well deserves the title bestowed on him by a popular French critic, of "the king and father of German painting;" nor do I think our praise will be too extravagant, if we say, as has been said ere now, that had he enjoyed the same advantages as Raphael, he might have rivalled the Italian. As it is, so great is the similarity of these two in spirit and style, that an inexperienced eye might frequently mistake the one for the other; and there is one point in which the painter of Nuremberg surpasses his rival—I mean in purity of conception. Exquisitely chaste as Raphael's earlier pictures are, it is impossible to study his works continuously, without perceiving that the corroding spirit of his licentious age acted upon the soul of the young Italian, and, through him, upon his productions: it was not so with Dürer. Kind, simple-hearted, and pure, he was to the last, and the very perfection of purity reigns in all his pictures; they may perhaps offend from want of grandeur and of sufficient spiritualization, but never from any approach to levity. He was born in 1471, exactly twelve years before Raphael, and was one of a family of sixteen—his father an honest burgher of Nuremberg, though Hungarian by

birth, was a goldsmith, and wished his second son to follow the same trade; but Albert, distinguished as he was for goodness, and docility to his father's will in all other respects, preferred the profession of a painter so immeasurably to that of a goldsmith, that his father was with great difficulty induced to consent to his quitting his original occupation. At the age of sixteen he commenced his studies under some of the most celebrated of the artists of Germany, and having, according to the custom of the period, travelled for some time, returned to his native city, where such was the excellence even of his earliest labours, that his reputation was at once established throughout Germany. He was the cherished favourite of three emperors, Maximilian, Charles V., and Ferdinand I., the former of whom created him a noble, and gave him a coat of arms, "*trois ecussons d'argent, deux en chef et un en pointe, sur un champ d'azur.*" The following, according to the chronicler, were the circumstances under which he obtained this honour:—One day that Dürer was employed in the execution of some paintings on the wall of the imperial palace, Maximilian, who was present, ordered one of his courtiers to steady the scaffolding on which the artist stood. The nobleman hesitated to undertake an office so derogatory to his dignity, and, drawing back, motioned to a servant to act as his substitute, whereupon the emperor, stepping forward, took hold of the scaffolding himself, and immediately on Albert's descending, created him a noble, saying to his court, "I must inform you, gentlemen, that this painter is already more than ennobled by his genius, for I can easily make a noble of any peasant, but all the power of the Cæsars would not suffice to make such an artist as Albert Dürer out of a nobleman."

(To be continued.)

THE LAST DAYS OF ETON MONTEM.

MOST of our readers have doubtless heard of the famous Eton Montem; some may have witnessed its singular ceremonies, and have borne in their hats the tickets received for payment of "*salt*:" whilst others have probably marched as the Etonians in the gay and half military procession from the college to Salt Hill.

All and each of these will naturally feel some curiosity respecting their old acquaintance, now passed away from the "things that be;" and may like to hear some little account of this quaint old festival, before its memory becomes hidden by the dust of modern life, and its once merry voice drowned for ever. Does any reader stop and ask whether Montem was the name of some respectable gentleman, a functionary of Eton College, or even one of its fellows? Whoever thou art, from whom so fun-provoking a question comes, we are bound to treat thee with singular respect, as a relic of the days when six-mile-an-hour coaches toiled along, and the traveller from Exeter to London ranked with those who had seen the world, and made the grand tour. We feel assured there are a few, living in little snug hamlets, or in old out-of-the-way towns, who might seriously ask such a question. Let, therefore, the learned topographer, who has seen Eton, and counted the windows in front of the college, and dined at the "Christopher," tour with us whilst we describe what Montem was; that is, if, remembering the death of Montem, and the removal of the dear old Christopher itself, we do not break down in the attempt.

Montem was a procession of the Eton students, on the Whit-Tuesday in every third year, from the college to a place about two miles distant, called "Salt Hill."

We have called it a *procession*, but it was no mere march of jacketed school boys; rather a train of juvenile field-marshal, or knights of some military order. For on this occasion the scarlet coat was worn, whilst the cocked hat with its streaming white plumes, and sword, and belt, completed the resemblance to a troop of officers on a review day. At a fixed hour, on Whit-Tuesday morning, the host assembled, "all padded and plumed," in the noble playing fields of the school, and, preceded by a military band, dashed forth into the Slough road. After a rather tumultuous march, the "Hill" was gained, and, surrounded by a mixed crowd, consisting of the scarletted Etonians, their friends in carriages, and on horses; whilst both people, and mob, combined to swell the torrent which rolled round that wee hill. Royalty itself was usually present, and thus John Bull and his thriving family gratified their loyalty and love of pageantry at the same time.

A flag was waved from the summit of "Salt Hill" by the captain's lieutenant, after which the boys and their friends dined, as boys alone can dine, in the grounds of Botham's Hotel, a spot well remembered by Etonians, and which the traveller in the "coaching" days must have frequently noted, when its festoons of flowering shrubs and prettily placed geraniums arrested every eye. But, during all these proceedings, where is the salt? Nothing, as yet, has been seen or heard of that! Let the reader suppose himself residing in some quiet spot within two or three miles of Eton, such as Langley, Stoke, Crippenham, or Dorney, on Whit-Tuesday, in the old times of Montem. As he is about to descend to breakfast, a commotion amongst the servants attracts his attention; one of these with an air of importance whispers that "a runner" is at the door. Our friend will there find a youth dressed as Robin Hood, an English bowman, a forester, an ancient Greek, or some prince of the Norman times, who, holding out a richly ornamented velvet purse, asks, with the air of a nobleman (he is perhaps a peer) for "Salt." This, in plain English, means *money*, which, if well instructed in the mysteries of Montem, you would not have refused. When the claim has been answered by the bestowment of a gift, the amount of which was left to your own feelings, the "runner" places a ticket in your hand, inscribed with some short motto, such as, "*Pro more et Etonia*," or "*Pro lege*," which secures the receiver from being further solicited by other "runners" during the day, and may indeed be considered a Montem pass-ticket. With this card in your hat a crowd of salt-takers may be passed without interruption; otherwise, an application is instantly made, and if salt be withheld, the luckless refuser would in all probability meet with such a series of annoyances from the crowds present, that an instant retreat or payment would be necessary.

The collectors seemed to act upon a sort of common-law right to a contribution, and regarded a denial as the withholding of a prescriptive due. Sometimes the stage-coaches were stopped, and every passenger *forced* to contribute, under pain of a shower of stones which generally lay provokingly near at hand by the side of the road. Most persons, however, were disposed to give *salt*, either amused at the singularity of the ceremony and the richness of the dresses, or persuaded by the really benevolent end of the whole day's festivities, which was to furnish the senior scholar with the means of proceeding to the University. The sums collected under the name of *salt* often amounted to 1,000*l.*; nor will this appear surprising, when it is remembered that great numbers of the nobility, and many of the richer merchants, attended the ceremony, and felt their honour involved in a liberal contribution. Much of this money was never enjoyed by the captain, who contributed to the expense of the breakfast for the whole of the *fifth* form, in other words, for the majority of the school.

The damage committed in the grounds of the hotel at Salt Hill, and even in the house itself, by the recklessness of many of the boys, would appear incredible.

For as he who "got Montem" was *supposed* by some of the boys to pay for all such damages,¹ those who bore him a grudge seized the opportunity on that day of destroying everything within reach, whether flowering shrubs, fruit trees, or fences; and in the hotel, tables, chairs, and wainscoting bore the marks of a hundred malicious knives. In fact, for many days preceding "Montem," men were employed in removing all the valuable furniture from the rooms open to the boys, and in fencing the shrubs with masses of stout bushes, which might have bid defiance to any assailants save a crowd of schoolboys armed with the fatal knife. Some years the destruction would be little, when the "Montem" hero happened to be an especial favourite, or some event had infused a high degree of satisfaction into the feelings of the scholars. But the general order of the day was havoc, which neither the authority of the masters, nor the better feelings of some in the upper school, could wholly restrain. Sometimes even a pique against the proprietor of the hotel, arising out of some past demand for dilapidation done to his property, would set the evil spirit loose; when hacked and belheaded trees, and shrubs with damaged edges, bore witness to the mischievous energy of schoolboys.

Such was Montem in some of its particulars. But there was much to attract the eye, and delight the imagination, in this celebrated festival. The crowds of carriages, resembling the confused splendour of a race-day, and the gorgeous dresses, exhibiting to our gaze the pictures of olden times, presented in one view a strange contrast between the present and the past. The tall keep of Windsor, with the royal flag displaying the rich bearings of the House of Brunswick, rose on one side in grand relief against the clear sky; whilst at its base the noble college seemed quietly meditating on the changes which had passed, even over Montem, since the days of the founder, Henry VI. Perhaps more than one spectator would feel that *such* a festival had lost much of the peculiar interest which in old times invested with fascination the mysteries,² and threw a charm over every pageant. From such questionings rose others, which have since proved fatal to the glories of Montem. But, ere we proceed to the circumstances connected with the downfall of this procession, it is proper to notice an inquiry likely to be proposed by many. Whence did Montem arise? from what event does it date? Here, reader, you have fairly caught us; and though we very much cling to the pleasant notion, that we know a bit of everything, yet upon this point we are beaten—that is, as far as a direct answer to your question is concerned. If you will allow us to supply theories and guesses on the subject, we shall be happy to furnish half a dozen at the shortest notice.

The origin of Montem is not *clearly* known, and those who have written on the subject have taken refuge in guesses, and statements of probabilities. Some trace the whole festival, and its peculiar proceedings, to an ancient ceremony once observed in many cathedral churches: we allude to the *election of the boy bishop*. This was the mock elevation of a choir boy to the office of bishop, in which species of ecclesiastical farce all the ceremonies of a re-election were mimicked. This pageant was celebrated on the day of St. Nicholas, that saint being esteemed the patron of children; and the whole festival was probably at first a religious service in his honour. Of such importance was this ancient ceremony deemed, that some founders of colleges directed its observance in their statutes; even at so recent a period as the time of Henry VII., this was the case in Rotherham College, founded by no less a person than the Archbishop of York. In the succeeding reign the custom was thought of sufficient importance to call for the interference of parliament, a statute being passed

(1) This was a mistake, as in general the proprietor received no compensation.

(2) The old religious dramas were so called.

for its suppression in the year 1542. Two circumstances which have induced some to connect the Eton Montem with the festival of the boy-bishop are the following:—First, the former period of celebrating Montem was not Whit-Tuesday, but December 6th; the very day dedicated to St. Nicholas, and usually chosen for the election of the boy-bishop in ancient times. It was not till the year 1759 that the time of holding Montem was changed from the gloomy month of December to the more bright season of Whitsuntide. Those, therefore, who trace Montem to such an ancient ceremony, have the singular coincidence of the time in their favour, from which it was not unreasonable to suppose a connexion between the triennial festival at Eton, and the ancient ecclesiastical mimicry of an episcopal election. Another circumstance favourable to the same supposition is found in one singular custom which formerly made part of the Montem festival. A boy was dressed in the habit of a clergyman, and then, receiving a prayer-book, read part of the service to the assembly; an evident resemblance this to the mimic services once performed by the boy-bishop.

But we need not dispute respecting the birth of Montem in the year which has witnessed its death. Last Whit-Tuesday would have been Montem day, had not the stern fates, in the shape of the provost and masters of the school, given old Montem a notice not to trespass again within their domains. To no other place could the patriarch betake himself; he therefore died, amidst the wallings of a miscellaneous host of mourners, composed of schoolboys, old Etonians, tradesmen, cabmen, omnibus drivers, innkeepers, and the Great Western Railway Company itself: for each of these derived either pleasure or profit from the triennial celebration of Montem.

Last Whit-Tuesday was indeed a time of mourning for many; but after grave consideration we assign the palm of sincere grief to the cab and omnibus men, many of whom expressed their sorrow on that day by wearing black crape on their arms. But why was Montem doomed to perish? why could it not have existed as a memorial of past times, serving, like the squibs and crackers on the 5th of November, and the garlanded sweeps on the 1st of May, to remind us of events and times so far removed? Surely, some sturdy advocate will say, whilst Temple Bar is cherished, Montem might have been patronized.

Many also urged an argument drawn, not from antiquity and memory of the past, but from the benefits conferred upon the senior scholar, who received so large a share of the *salt*. Notwithstanding all these appeals, discharged from meetings in London, and through the press, the provost, Dr. Hodgson, and the head master, Dr. Hawtrej, voted for abolition. Why? It will be presumed that no disposition has been evinced by either of these gentlemen to interfere ruthlessly with old customs, which bind us to a past age not wholly unworthy of our remembrance. No such charge can be reasonably advanced against either the provost or the head master; both have ever consulted the *great interests* of the school in preference to any *personal* predilections. Montem fell because its *existence was deemed injurious to the school*. We are not here stating an opinion of our own, but the deliberate convictions of the Eton authorities, who must be admitted to possess abundant opportunities for forming their judgments on such a subject. Few can estimate the whole extent of the evil consequences attendant upon the celebration of Montem, except the masters of the school, and a few of those more immediately connected with the institution. But, when it is remembered that the boys and young men regarded the day as a complete saturnalia, as one of perfect liberty, and impunity; when we also bear in mind the thousands who flocked from all parts; the open inns, the free use of wine amongst the youths, and the consequent *intoxication* of the scholars; all persons will easily perceive the nature of the evils

which aroused the heads of Eton to so decisive a measure as the abolition of the ancient festival. It may be asked whether the money once raised at Montem will still be secured from some other source, such as the College revenues, or from periodical contributions? If so large a bonus is lost every three years to the College, it will appear to many a serious subtraction from its educational resources. Many regretted that, with the notice for the abolition of Montem, an intimation was not given that a *LAST* festival would be permitted; but the masters were probably fearful of the excitement which might have arisen under such circumstances, and would not give to poor father Montem the right of entry for one hour.

Last Whit-Tuesday did not, however, pass off as an ordinary day at Eton. The boys, who might have cared little for the result during the deliberations between the pro-Montemists and the anti-Montemists, got rather dissatisfied when the day came without bringing their old friend. Then the feeling that Montem was really gone took a strong form, and attempted to develop itself in some little outbreaks partaking more of the boyish, than of the philosophical, character. Some unoffending windows, and unconsumed lamps, seemed likely to suffer fractures in honour of the insulted shade of Montem. A few desperate adherents actually donned the scarlet coat, endeavouring to look something like Montem heroes; but it would not do; the very air of the quadrangle, and the bricks in the old college wall, seemed sulky; and it was clear, that the spirit of vengeance was lurking in a hundred hearts, all anxious to avenge the slaughter of their old favourite. One melancholy party actually prepared to celebrate the "*funeral*" of Montem, and proposing to bury him on the scene of his former triumphs. Some mysterious ceremony was, towards evening, performed on Salt Hill; but whether it assumed the form of a great conspiracy to restore Montem to his throne, or of a solemn league and covenant to construe no more Greek till he returned,—our deponents say not. Something was rumoured by the denizens of Salt Hill about a great shouting and "the waving of a flag;" but their sorrow rendered them too incoherent to give trust-worthy evidence.

Thus, another symbol of the past has left us, to mourn over our isolation from former ages, or to rejoice that the field is cleared for modern operations—just as our principles and feelings may dictate. We cannot, however, be surprised that thousands regret the departure, one by one, of old customs and pageants, which were either closely connected with our ancient history, or reflected some peculiar spirit of the age before us. This reverence for the symbols of the past, even when they have lost much of their former significance, is natural to man; and, though it may be indulged at the expense of still higher feelings, such an abuse does not prove the spirit itself to be wrong. He who would hide all antiquity from his view, and obliterate every emblem of by-gone times, is far more unreasonable than the man who desires to contemplate the past only. Both are unreasonable, but the admirer of antiquity has a world abounding with great events and noble characters, upon which he may gaze with the feeling that the object of his delight owes nothing to modern times; for the ancients flourished without us. But the modern man, who despises *all* the past, does, in fact, pour contempt on the institutions of his country, and the customs of the society in which he lives; for those are derived, in many particulars, from preceding ages—we cannot do without the ancients. Were the soil on which the pyramids stand proved to be the most fertile on earth, we should not be willing to destroy these giant piles, in order to turn their sites into arable fields. Our reverence for the past would prevent us. Yet, a skillful disputant might argue, that good corn fields are of more service to men than all the pyramids.

Let us, therefore, combine the two feelings which

should ever co-exist—*reverence* for the past, with *love* for the present. We shall then attack no symbol on the tomb of antiquity with a rude hand, nor injure our own times by trammelling them in the robes of remote periods. Such reflections have been forced upon us by the abolition of the Eton Montem, and the different feelings with which that event has been regarded.

We can only, in conclusion, express a hope that the *honourable principles* which flourished in remote ages, and the *spirit* of the charter of Eton College, will long live in that ancient foundation, forming great and manly minds for the national service. The abolition of Montem will then call for few regrets; as it need excite no irritation in the minds of present or former Etonians.

W. D.

COUNTRY SKETCHES.

No. I.

THE GRAVE OF ISAAC WALTON.

THERE are few places of more interest than Winchester. The venerable cathedral would of itself amply repay the cost and trouble of a summer day's pilgrimage. The hospital of St. Cross is a most interesting structure, and is in many respects perfectly unique. Then there is the college, with its curious ecclesiastical brasses and the celebrated quaint figure. The market-cross, the round table, the ancient gateways, the ruins of the castle, and the numerous churches, are all objects of attraction, and will afford the antiquary and artist very great gratification and pleasure. The opportunities of visiting this city are now so great, and the means so accessible by reason of the railways; that, from London or the west of England, the journey can be accomplished with very little expense, and in very short time.

It is not, however, my intention to lead the reader to the contemplation of the architectural beauties of the work of William of Wykeham; or to invite him to linger in the cloisters of the beautiful hospital of St. Cross. He may, if he pleases, eat a munchet of bread and drink a horn of beer at the porch of the hospital, and bless the bounty that has so liberally provided for the corporeal necessities of pilgrims and wayfarers like himself; but, having thus far satisfied the cravings of nature, let him follow me by the banks of the sweet river Ichen; he shall listen to the pleasant ditties of the birds, and hear a music, as he lists, in the light-toned trembling of the reeds. The gaily docked kingfisher shall hover round the trunks of the moss-grown trees, and the trout shall rise with their burnished fins so to tempt him, that he shall scarce forbear the use of his rod and line. And the nightingales! aye, they shall feed the air with their melodious warblings. Very fragrant, too, shall the wandering breezes be, laden with the delicious aroma of the new-made hay. Bees, and blossoms, and all fragile things, shall float in the clear and ambient air, so if he be not cheerful and content he will be truly "a grave man." Of a verity, it is a lovely spot, and, all England over, there is none other to be found so suggestive of one who once listened to the singing of its birds, and who angled many a summer's day in its pure and peaceful waters. And not far from this he rests in the long sleep of the night that knows no waking. Who has not read the *Complete Art of Angling*, by Isaac Walton, Gent.? Who has not followed him by this same stream, and by the Lea, and heard him discourse upon the dainty pleasures of his favourite pursuit? Who can ever forget his descriptions of rural life in that quaint old tome, or his free and pleasant colloquies? Above all, and through all, what a true and unaffected piety! what a humble sense of the divine blessings! what a fervent expression of

gratitude and joy for the beauties with which the glad-some and teeming earth so copiously abound! He is truly worthy to be ranked amid the number of those who string their lyres to gentle verse.

The apathy of a past and a passing age has too lightly regarded that amusing volume. Many who look on angling as a cruel pastime, and unworthy their attention, have turned with indifference and aversion from those delightful pages. Open the book once with a fair and honest attention, and thou must read on, oh! lover of nature, poet, philosopher, moralist, or whatever other title thou dost call thyself! It is a book for all ages, and all times. Thou must needs be critical if there is aught to offend thee in it. It is a perfect English pastoral—an idyll in prose. To enjoy it as it ought to be enjoyed, let it be read by the side of some murmuring stream, where the waters, flowing with a gentle sound, shall be the sweet and fitting accompaniment to the voice of one who being dead yet speaketh. It is the sweetest commentary on the scenery of river-ways that was ever sung or said. It is enough to persuade any one to turn piscator, and to realise its contents in his own person. But let not the gentle reader forget that he has been roaming by the side of the Ichen, and, having accomplished so agreeable a stroll, let him direct his steps to the antique Minster. There he may pause to admire the effect of the beautiful columns, and lose himself in a transport of delight, as the organ's solemn peal is heard vibrating through arch and transept. The choir, too, is particularly good, and he may listen with ever renewed pleasure to the voices so happily blended. But it is my wish that he bend his steps to a chapel formed in the eastern aisle of the south transept by screens of stone tracery work. It is called Silktede's Chapel. He was a prior from 1498 to 1524. On the cornice or crest of the stone screen his christian name Thomas is so carved that the monogram M. A. is distinguished from the other letters. The Virgin Mary having been his patroness, it was in this manner he testified to the fact. A skein of silk, the rebus of his surname, also appears.

Upon entering the chapel the eye will be soon arrested by a blue stone. Hereunder lies all that is mortal of Isaac Walton. Reader! it is worth more than a passing glance, so let us pause and read the inscription. Before doing so, we may see for a fleeting moment, in our mind's eye, the good old angler in his habit as he lived; we may hear the utterance of one of his sweet homilies on nature, and then, bending reverently forward, trace these lines:—

"HERE RESTETH THE BODY OF
MR. ISAAC WALTON,
Who died on the 15th of December, 1683.

Alas! he's gone before;
Gone, to returne no more
Our panting breasts aspire
After their aged sire,
Whose well spent life did last
Full many yeares and past;
But now he hath begun
That which will ne'er be done.
Crowned with eternal blisse,
We wish our souls with his.

VOTIS MODESTIS SIC FLEUNT LIBERI."

So, almost within sound of one of his most favourite rivers, lies the body of the old High Priest of Anglers. Peace to his ashes! It is by no means improbable that the spot was selected by himself. Oftentimes he would lay aside his rod and tackle, to cogitate and muse on the things that never fade. Doubtless he must have wandered, amid the pausings of his art, through the cloisters and aisles of the beautiful cathedral, and, after reviewing the delicate tracery and fretwork all round him, he may have entered Prior Silktede's chapel, and letting his staff fall gently down, may have exclaimed, "Here let me lie!"

There are several portraits of him; one in the possession of the Earl Cowper bears a striking resemblance to the plate which is appended to the first edition of his work on angling; it represents him to be precisely the figure and face one would have expected to see. Generosity, benevolence, charity with all men, beam in every trait. The spectator might gaze upon it till he could fancy the lips were uttering—

"Come away,
Turn, countryman, with me;"

or speaking in goodly commendation of the beauties of the outer world,—praising the earth, the water, the skies, and in all things else manifesting his poet-love for the sweet realities of life. To the voluptuary, the man sated with the unrealities of a career of mingled dissipation and folly, let me advise a stroll by some river's side, and there, with Isaac Walton's pages in his hand, he may taste new life, aye, and inhale a vigour foreign to his wearied senses. He will learn there, how full of fair and soft compensations Nature is; how, to him who seeks it with a trustful faith and a reverent love, she holds forth a draught of the purest nectar,—one which never palls upon the taste; a draught every way superior to the Circean cup of mad enjoyment, which clings to the sensualist, at the renewal of each intoxication, with disgust and loathsome tenacity. To the poet the book is a study, full of sweet conceits and quaint and pleasant prettinesses. To the angler it is a manual, without which his piscatorial equipments would be incomplete.

Surely the grave of such a man is worthy a visit, if only to renew and refresh our memories with a feeling of reverence for his departed excellence and worth. So may we pass from out the magnificent Minster, and the chapel of the old prior, into the sunny air, and take our path again by the Ichen's banks, where we shall feel that the spirit of the old poet-angler hovers all around us, and we shall be led, like him, to praise and thanksgiving for all earth's fairest blessings. Not inaptly may we exclaim, in the words of Sir Walter Raleigh—

"Blest silent groves! oh, may ye be
For ever nirth's best nursery!
May pure contents
For ever pitch their tents

Upon these rocks, these downs, these meads, these mountains,
And peace still slumber by these purling fountains,

Which we may every year
Find, when we come a-fishing here."

THE INACCESSIBLE ISLE.

A YOUNG princess of remarkable beauty reigned over an island, in which nothing was wanting to satisfy man's desires: the mansions in it were covered with plates of gold, and the palaces were paved with the same rich metal. The inhabitants lived, each one more than a century, in perfect health; and their long life was never embittered by litigation; such games as avarice has invented had no charms for them; they enjoyed that calm bliss which brings with it neither care nor inquietude.

This island had been for ages unknown to the rest of mankind; all who dwelt there lived so happily, that they were not willing to leave it, and they did not receive strangers, for fear the simple manners of the inhabitants should be rendered corrupt. The curious men of that age who had spent their life in discoveries, had frequently passed and repassed the island, without having had any acquaintance with its people, for nature had thrown around it a chain of rocks which rendered it inaccessible, and there was only one passage which led

to the port, in which a thousand vessels could have been moored securely. As men were travelling in search of new habitations, and marvellous discoveries were being made on all sides, the princes of the isle begged a boon of the fairies, who had been with them from time immemorial, that they would use their skill in preventing the curious wanderers, who had already explored so many spots unknown to all in former ages, from penetrating into their land. The only way in which the fairies could grant their request was, to envelop the isle in so dense a cloud, that none could see through it. Their plan succeeded so admirably, that, although many approached the rocks in the hope of discovering an island, their search was useless, as they found nothing but a dense obscurity, that the strongest eyes could not penetrate.

After the first two ages had passed away, the princes were seized with a curiosity to know what was passing in the world, and their custom was to send spies, from time to time, to their immediate neighbours: for this purpose they chose the most faithful and fitting of the courtiers, to whom the fairies granted the power of flying as far as they pleased, reposing at times upon some rock in their path. They had also given them the power of becoming invisible, by means of robes which they wore, brilliant as the noonday sun. This facility of despatch to their neighbours had informed the islanders of all that was going on in the world without, so that there were to be found among them numbers of politicians, or rather newsmongers, who discussed the absorbing topics of the day, and canvassed the deeds of foreign powers; they frequently surpassed in their knowledge even the most shining characters that we know, who, nevertheless, venture to decide upon the claims of peace and war, without having the least notion of the subject.

The princess, who was of a moderate age, grew weary of the calm tranquillity in which she lived: she had ascertained, from the accounts of her spies, that there was a mighty king in the world, who had acquired brilliant glory at the head of his army, and good reputation for his wisdom at home, and that he was redoubtable in the opinion of all his neighbours. He was so mild, so polished, and affable, as to have engaged the affections of his subjects; he held a magnificent court, where all pleasures were to be found; he was occupied in tournaments, the chase, balls, concerts, theatrical entertainments, and banquets, surrounded by a brilliant assemblage of both sexes; still he was the most handsome man among them, and his fine face was united to such majesty of person, that it stamped him at once a hero. He allowed all the painters in his dominions to take his portrait, giving them the liberty of working every morning while he was at his toilet.

The princess of the island, who was aware of this, charged one of her spies to convey her into his presence; and as soon as she had seen him, she felt seized with a sudden fit of grief, because her island was unknown to him; the tranquillity of her court appeared insipid, and she esteemed all her courtiers infinitely beneath a king of so handsome a face, and so splendid a reputation. She took to reading works of fine adventures, and would listen to nothing but descriptions of heroes, and their knightly achievements; and at last she imagined that she should never be happy, unless the king,

for whom she entertained so profound an attachment, would extend his love to her. But how could this be? She was not known, nor the island in which she held sway. She called one of the fairies to her, who enjoyed the reputation of the greatest share of wisdom among all, and after having communicated to her the desire she felt to form an alliance out of her own island, and spoken of the merits of the mighty king, she inquired by what means she could make him acquainted with her sentiments, and kindle reciprocal affection for her in his heart. The fairy informed her that the first act must be to render him acquainted with the island, that he might be curious to know what was being done in it, doubting not, that if he once heard of the merits of the princess who ruled it, his passion would be stronger for her than for her dominions.

Of a truth it seemed that it was the destiny of this mighty king to love the princess, as she was one of the most beautiful creatures in the world, and he had never been in love before, though his court abounded in beauty and talent. The princess, too, seemed to have reserved her heart for the king, for there was no lack of high-born princes and cavaliers in her own court, but she treated them all with the greatest indifference. At length the princess, under the advice of the fairy, resolved to send to the mighty king's court the spy whom she had previously sent; he was to fly thither by means of his fairy power, but instead of rendering himself invisible, he was ordered to make his appearance as a stranger in the course of his travels. The princess supplied him with money and jewels, that he might be enabled to dress in the manner of the country; and by this means he introduced himself into the best company. After having made some stay at the place, he contrived to ingratiate himself with those who were more particularly in the confidence of the great king. One day he was a guest at the table of one of them, and there were other strangers present, and every one began to put forth the peculiar merits of his sovereign. He stated that he had the honour to be a subject of a princess, whom it was more glorious to serve than to rule elsewhere. "I have," said he, "where-with to justify my assertion," and he produced a portrait of the princess, in a little case, set with precious stones of immense value: it attracted the eyes of all present. They rose to tender homage to her peerless beauty, and to look more closely at her charming face. "Tell us," cried they, "what spot in the wide world claims to be the birth-place of so wonderful a princess?" But he declined satisfying their curiosity; and no one repeated the question. The repast was soon over, but the rumour of the surpassing beauty of a princess whom no one had seen, and whose kingdom was unknown, soon reached the court. The king, anxious to know what he had only heard of by snatches, and wishing to see the portrait of so charming a princess, sent to tell the stranger, who had it in his possession, that he wished to speak with him. The envoy, who wished for nothing better, told the king everything that was calculated to arouse his passion for the queen and her kingdom, and then, by displaying the portrait, finished what he had begun by his speech. The king, meanwhile, surprised at such exquisite features, kept his eyes fixed upon the portrait, raising them at times with a deep sigh, and begged the envoy,

with a display of intense feeling, to inform him whether it were possible or not to see this charming princess.

The envoy replied, that all was possible to so mighty a king, and that the princess, who ruled in an island inaccessible to all other powers, would grant him an easy passage, whom she already highly esteemed, in consequence of the favourable reports that had reached her of his valour and wisdom. The king begged the envoy to forward the visit as much as possible, saying, that he could not live without her. "Ask any reward for thy services," continued he, "and it shall be thine." But the envoy replied that his majesty might see the princess at any convenient time, but that he could receive no reward, save from the hands of the princess, to whom he had tendered an oath of fidelity.

After a secret conference with the king, the envoy departed homewards, to inform the princess that the mightiest monarch in the world was seized with a passionate desire of seeing her, and that he was coming, with a fleet of unbounded magnificence, if she would condescend to grant him a practicable passage to the island. The princess immediately called to her aid the wise fairy, who placed upon the summits of two rocks, that stood at the sides of the entrance to the port, two immense globular diamonds, which threw out more rays than the sun on the clearest day. The envoy carried back the news to the great king, who set sail instantly, impatient to behold the princess, who was now the delight of his heart.

The rumour of the discovery of an island hitherto unknown, and of the beautiful princess, was soon noised over the world; and a neighbouring king, jealous of the prosperity of this mighty monarch, resolved to dispute his claim to the prize, and accordingly followed him with a formidable fleet of war, as soon as he was on the broad ocean. This proved a great subject of fear, for the king, who commanded the fleet, had the aid of a fairy, whose spells were so powerful that nothing had been found hitherto superior to them: she had lately become friendly to this sovereign, and had promised to place all his rivals beneath his feet. The first opportunity that offered itself to test her good intentions, and her mighty power, was this; and its object the conquest of the princess and her island. The two fleets caught the breeze, and sailing near one another approached the island at the same time.

The wise fairy who was attached to the interests of the Princess, having ascertained by her art that two fleets were approaching the coast, sent out a troop of dolphins, embued with fairy skill, who, on recognising the fleet of the great king, surrounded his vessel, and piloted him into port. It was a beautiful sight to see this number of sporting dolphins, who vied with each other in their endeavours to approach nearest to the royal ship.

Meanwhile, the fleet of the foe, on the contrary, was assailed by hideous monsters of the deep, and by large whales, which obstructed its progress: to increase its disaster, a contrary wind sprang up, and in this interval, the sails of the great king swelled out, and he passed between the two rocks, bearing on them the globes of diamond under the form of beacon-lights.

The king, seeing the failure of his hopes, reproached the fairy with her inability to help him at

need; but she excused herself to the best of her power, alleging that it was owing to the influence of a superior fairy; at the same time she hurled an infinite number of fireballs against the fleet of the great king, but in vain, for not a single ball reached half the distance between the two fleets. The king, in despair, finding that his rival triumphed over all his projects, set all sail to pursue after him, but a terrible storm instantly arose, and his fleet was speedily dispersed; some of the ships were dashed upon the rocks that formed the ramparts of the isle,—he who commanded it was thrown ashore upon his own coasts; but the great king made his entry into the port of the isle to the sound of a thousand trumpets.

Who shall tell how great was the pleasure of the beautiful princess, when she beheld, from a balcony of her palace which overlooked the port, such splendour and magnificence as she had never seen before. The royal vessel appeared at the head of the squadron, decked out with ensigns, flags, and banners, of silk of all colours, and resplendent itself with gold and crystal! As soon as the great king entered, he sent ambassadors to the princess, to beg her to allow him to set foot in her dominions, and to permit him to offer the homage of a heart teeming with infinite respect for her, and beating with love and affection. The princess made this courteous reply: "Tell his majesty that I am heartily glad of his presence, and impatient to see him."

The king immediately landed, and proceeded to the palace, and the princess advanced to meet him at the entrance of the state-chamber. The surprise was reciprocal,—the king thought the princess a thousand times more beautiful than her portrait, and she beheld him even more majestic and handsome than she had expected. Their conference abounded with terms of courtesy and politeness, and the king was conducted, by all the grandees of the court, into an apartment where his eyes rested on nothing but precious stones, cloth of gold, and silks of very great value. Here was served up a magnificent banquet, of all that could gratify the palate, or charm the senses. He was attended by four young fairies, wearing robes studded with rubies; they placed on the table before him delicious meats, some of which he had never tasted before, and the dinner service was a thousand times more costly than the finest gold, and the sideboard was loaded with flasks and vases of the same rich material; among them were two immense pearls, that could not be surpassed. The king drank out of a cup formed of a single emerald; the liquor was more delicious than all the ambrosial nectar served at the tables of the gods. But such magnificence and dainties did not engage the king's mind for a moment; he entered into his cabinet, and summoned his ambassadors, who were to inform the princess of the motives of his voyage, and, if she should be agreeable, to appoint the hour for their nuptials.

The marriage was solemnized on the morrow, and was followed by several days of rejoicing, and by years of undiminished happiness. After the king had passed several months delightfully in the island, he conveyed the princess to his own kingdom, where they were crowned with great pomp. Several of the courtiers also were united to the ladies of the princess's court, and all were charmed to reside in the society of a king who ruled in the

hearts of his people. The great king, as a recompense to the skilful fairy, for the good fortune which she had procured him, begged her to rule over the Inaccessible Island. "I accept the boon, mighty king," replied the fairy, "only to celebrate your name, and to hand down to future ages the merits of so wise a monarch and so lovely a princess: your commands shall be mine, and they shall be carefully obeyed."

The inhabitants of the fairy's isle, and the subjects of the king, enjoyed unalloyed happiness, such as flows from a just dispensation of the laws, emanating from a throne of brilliant wisdom.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals, under the title; in Selections it is printed in Italics at the end.]

THE BALLAD OF GUNHILD, OR THE PHANTOM SHIP.

From the Danish of Ingemann.¹

FAIR Gunhild stands on the galley's deck
And looks on the calm blue sea,
She sees where the pale moon mirrors itself,
And the stars shine tremulously.

She sees the moon, and the emerald light,
On the blue waves sweetly smile,
While the galley glides softly, like a snake,
To Britain's distant isle.

Thither, long since, in his dark prow'd ship,
The little maid's love had sail'd,
Ah me! ah me! as she stood alone
That day she wildly wail'd.

He promised letters of love to send,
And soon to come back again,
But no letters of love did he ever send,
Nor did he come back again.

Fair Gunhild—alas! she could not rest,
Her heart beat wild with fright,
And she went from her father's and mother's house,
All in the murky night.

And the galley's deck did she straight ascend
Her dear betrothed to find,
Whether he lay in a far-off land,
Or rock'd by sea and wind.

Fair Gunhild was toss'd about three days
All on the wild white wave,
But on the third night of moon and stars
The sea grew still as a grave.

And the maiden stood on the galley's deck,
And look'd on the calm blue sea,
And she saw the pale moon mirror itself,
And the stars shine tremulously.

The crew were lull'd in their slumber calm,
The helmsman bow'd in sleep,
While silently in her robes of white,
The maid look'd over the deep.

Then from the depths of the ocean, rose
A wild and shadowy ship,
And slowly, and weird-like, over the waves
She saw the strange thing skip.

The ghost-like sails were rent in twain,
By the board the mast had gone,
She could not sail, but like a wreck
She dreamily floated on.

(1) This ballad has never been translated before.

And all on board was still as death,
She moved without life or sign,
The crew were flickering human shapes,
Like mists in the pale moonshine.

Now struck the wreck the galley's side,
But none could hear or see,
But the maid who saw from the lonely deck
The stars shine tremulously.

Then a whisper came, "O fair Gunhild,
Thy lover thou fain wouldst find;
He does not sleep in a foreign land,
But is rock'd by sea and wind.

"And cold and lone is his watery grave,
Down in the deep sea laid;
And thus, alas! must thine own one dwell,
Apart from his plighted maid."

"Full well do I know thy gentle voice,
O thou in thy sea grave laid,
And, oh! no more shall mine own one dwell
Apart from his plighted maid."

"No! Gunhild, no! thou art yet too young,
And thou must remain behind,
I will not weep, and I will not sigh,
When pleasure gilds thy mind.

"The plighted pledge of thy fond true heart
I give back again to thee;
And, oh! let another love be thine,
While the ocean grave hath me."

"I will be thy dear and faithful wife,
My oath I still must hold;
And is there not room for both of us,
Dear love, in thy grave so cold?"

"The wild wide sea for many hath room,
But dark are its depths of woe:
When the bright sun shineth above in the sky
We slumber still below;

"And only, alas! in the midnight hour,
When the cold pale moonbeams fleck
The sea, can we rise from our dreary sleep,
And float on our shadowy wreck."

"Let the bright sun shine above in the sky,
I'll sleep in thy dear lov'd breast,
And there forgetting the ills of life
Will I take my gentle rest.

"Stretch forth thy hand, my own dear love,
Thy plighted virgin take;
And I will dwell in thine ocean grave
With thee, for love's sweet sake.

"And only, love, in the midnight hour,
When the moon and star-beams fleck
The waves, shall we rise from our gentle sleep,
And float on our shadowy wreck."

Then she gave the dead her lily-white hand—
"Fair Gunhild be not shy,
Quick, quick, dear love! the morning breaks
Aloft in the dappled sky."

The maiden descended down on the wreck,
It drifted away again;
And the galley's crew woke up in fear,
The Dead Ship began to wane.

Pale and cold stood the galley's crew,
Gazing like maddened men;
They raised a prayer to God in heaven—
The Dead Ship vanish'd then.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

No associations are stronger than those connected with a garden. It is the just pride of an emigrant, settled on some distant shore, to have a little garden, as like as he can make it to the one he left at home. A pot of violets, or mignonette, is one of the highest luxuries to an Anglo-Indian. In the bold and picturesque scenery of Batavia, the Dutch can, from feeling, no more dispense with their little moats round their houses, than they could, from necessity, in the flat swamps of their native land. Sir John Holhouse discovered an Englishman's residence on the shore of the Hellespont, by the character of his shrubs and flowers. Louis XVIII. on his restoration to France, made in the park of Versailles the fac-simile of the garden at Hartwell; and there was no more amiable trait in the life of that accomplished prince. Napoleon used to say that he should know his father's garden in Corsica, blindfold, by the smell of the earth: and the hanging gardens of Babylon are said to have been raised by the Median queen of Nebuchadnezzar, on the flat and naked plains of her adopted country, to remind her of the hills and woods of her childhood.—*Quarterly Review*, No. 139.

CRAUELTY to dumb animals is one of the distinguishing vices of the lowest and basest of the people. Wherever it is found, it is a certain mark of ignorance and meanness; an intrinsic mark, which all the external advantages of wealth, splendour, and nobility cannot obliterate. It will consist neither with true learning nor true civility; and religion disclaims and detests it as an insult upon the majesty and the goodness of God, who, having made the instincts of brute beasts minister to the improvement of the mind, as well as to the convenience of the body, hath furnished us with a motive to mercy and compassion toward them very strong and powerful, but too refined to have any influence on the illiterate and irreligious.—*Jones of Nayland*.

THERE are certain interests which the world supposes every man to have, and which therefore are properly enough termed worldly: but the world is apt to make an erroneous estimate: ignorant of the dispositions which constitute our happiness or misery, they bring to an undistinguished scale the means of the one, as connected with power, wealth, or grandeur, and of the other, with their contraries. Philosophers and poets have often protested against this decision; but their arguments have been despised as declamatory, or ridiculed as romantic.—*Mackenzie's Man of Feeling*.

N.B.—A Stamped Edition of this Periodical can be forwarded free of postage, on application to the Publisher, for the convenience of parties residing at a distance, price 2s. 6d. per quarter.

THE DRAMA IN THE MIDDLE AGES.

Of all the remarkable periods of history, not the least interesting is that comprised in the so-called middle ages. With the downfall of the Roman empire every vestige of civilisation seemed to be lost in the moral chaos by which that event was succeeded. Dark, however, as the period in question is generally supposed to have been, it was pregnant with the formless elements of modern society, floating amid confused recollections of bygone customs, laws, and achievements—uncertain attempts in a new direction—dependent in a greater degree on the past than the rude intellect of the time was willing to acknowledge. Christianity had found a resting-place in the world, and was silently, though surely, sapping the outworks of ignorance. Printing, gunpowder, the mariner's compass, the telescope, owe their discovery to the middle ages. In the marked distinctions which then prevailed between the various orders of society, the lower classes were reduced to a state of moral and physical degradation. Possessing but very few, if any legal rights, they were entirely at the mercy of the lords of the soil; a position from which they made many desperate, and, in the end, successful attempts to free themselves. When unable to use more offensive weapons, they satirized and ridiculed their masters in their ballads, songs, and rude dramatic representations. In fact, satire is one of the great characteristics of the period; it shows itself everywhere—in the metrical romances, fabliaux, and tales; seizing upon councils, sermons, architecture, religious ceremonies, and all the weak points in the character of the nobles and the clergy, as fair game. It was one of the earliest scintillations of that intelligence which has since effected such mighty changes.

From the very dawn of civilisation, dramatic genius, in some shape or other, has been continually reproduced. Even the rudest tribes delighted in theatrical amusements, in which deities or demons sustained the principal characters. In common with other arts, it rose to the highest degree of perfection among the Greeks, by whom it was transmitted to the Romans. On the subjugation of the latter power by the Teutonic hordes, the drama disappeared; the spread of Christianity also tended to suppress it. The emperor Theodosius the younger published laws forbidding *shows* at Christmas, Easter, and Pentecost. The Fathers, too, denounced plays in the severest terms; Tertullian, in his work *De Spectaculis*, animadverts on the evil and profane tendency of theatres. But the spirit of mimicry was not to be repressed; it manifested itself in palaces, feudal castles, abbeys and cathedrals, and in the public thoroughfares, adapting itself necessarily to the vicissitudes of time and custom, refinement or barbarism. The antiquary of our day regards the manuscripts of old plays as some of his rarest treasures; and the philologist finds in them many curious and valuable illustrations of the earliest specimens of modern idiom. Notwithstanding the authority of the Fathers, we find that after a time the authorities of the Church availed themselves of the drama, to impart instruction to the populace, and at the same time to confirm their own power and authority. The sacred plays, called *Mysteries*, were written in rude rhyming Latin; but, as the common people were not well acquainted with this language, many popular words and phrases gradually crept in, forming a strange contrast to the sonorous original, until at length, in the fourteenth century, the plays were spoken in the current dialect of the day. Some of the old Latin dramas were so strictly connected with the ceremonies of the Church, that they were never represented but in the interior of sacred edifices, by performers chosen from among the

monks and priests. Others, equally religious in their tendency, in which a visible and edifying paraphrase of some portion of the liturgies was set before the ignorant multitude, were acted in some public place within the sacred precincts, by pious laics, under the sanction of the clergy.

These dramas were highly relished by the populace, especially when the decline of the feudal system, with its joustings, tilts, and tournaments, left them no other public amusement. In our own country, the Chester Mysteries, or Whitsun Plays, were frequently acted in that city during the thirteenth century, to the great delight of all classes of spectators. In the programme or proclamation we are told that "Done Rondali, moonke of Chester Abbey," was the author:—

"This moonke, moonke-like, in scriptures well scene,
In storyes travelled with the best sorte;
In pagentes set fourth, apparently to all eyne,
The Olde and Newe Testament with lively comforte;
Intermynglinge therewith, onely to make sporte,
Some things not warranted by any writt,
Which to gladd the hearers he woulde men to take yt."

The concluding lines afford a strong presumption that the clerical actors were not averse to the introduction of some lighter topics among the grave matter of the drama, which may probably account for the great degree of public favour they received. So much, indeed, were the plays to the taste of the populace, that they divided attention with the favourite ballads of Robin Hood.¹ The collection known as the Towneley Mysteries contains many curious instances of chronological error, which may take their place by the side of those committed by Shakspeare, and Beaumont and Fletcher. In one of the plays by the latter writers, Demetrius fires a pistol long ere gunpowder was thought of; and the former makes Hector quote Aristotle. In the Mysteries, however, the high-priest Calaphas is made to sing mass; Noah's wife is acquainted with "Stafford blew," and swears by the Virgin Mary; the Shepherds in the Nativity talk of "the foles of Gotham," swear by "Sant Thomas of Kent," and are engaged in beating a man who had stolen one of their sheep, when the angel appears singing the *Gloria in excelsis*. These incongruities, which would afford "food for laughter" to a modern audience, passed unnoticed by the superstitious spectators of former days. In another of these Mysteries, the *Processus talentorum*, we have an example of the admixture of Latin with the vulgar dialect. Pilate enters, declaiming somewhat in the style of the "bashful" Irishman:—

"Myghty lord of alle, me, Cesar magnificavit;
Downe on knees ye falle, greatt God me sanctificavit;
Me to obey over alle, regi reliquo quasi David,
Hanged be, that he saile, hoc jussum qui reprobat.
I swore now,
But ye your hedes
Bare in this shaddes
Redy my sword is
Of thaim to shere now."

But the greatest variety of these religious dramas is perhaps to be found in the ancient literature of France. Whether more importance was attached to the due observance of festivals in that country than on this side the channel, or from some other cause, we find numerous short pieces written, to be played on certain feasts and saints' days. At Christmas, for instance, the Mystery of the Nativity, of the Star, or the Adoration of the Magi, was given; while at Easter were represented the Scenes of the Crucifixion, the Tomb, the Three Marys, or the appearance of Christ to the disciples at Emmaus. The *Suscitatio Lazari*, or the Resurrection of Lazarus, was a favourite piece for occasional performance; and the anniversary of Saint Nicholas was cele-

(1) Two lines in the Vision of Piers Plowman, mark the popularity of the ballads:—

"I cannot partly mi Patir noster as the Priest it syngeþ;
But I can Rymes of Robenhold, and Randolf erl of Chester."

brated by the *Ludus super iconia Sancti Nicolai*. The two latter pieces were written by Hilary, a disciple of Abelard.

From the titles of many of these old dramas we obtain a glimpse of the religious feeling of the day, in which the worship of the Virgin was strangely mingled with singular and romantic notions. Some of them would doubtless draw an audience in the present day. What a treat for the lovers of the marvellous would be "The Miracle of Amis and Amilla, the which Amilla killed her two children to cure Amis her husband, who was leprous; and afterwards our Lady restored them again to life!" The title of another is, "The miracle of our Lady, how the King of Hungary's daughter cut off her hand, for that her father wished to marry her, and a sturgeon kopt it (the hand) seven years in his stomach." A third relates to the conversion of one of the early Gaulish kings from paganism; "The miracle of our Lady, how king Clovis made himself to be christened at the request of Clotilda his wife, for a battle which he had against the Alemans and Scens (Germans and Saxons), and won the victory, and at the christening descended the holy ampulla."¹

In the fourteenth century, however, a change took place; a collection was made of all the principal events of gospel history, and formed into one vast and single representation, no longer played, as formerly, on particular days and festivals, but continuing throughout several days, and sometimes for weeks, and at any period of the year. The most celebrated of these comprehensive dramas was called, the *Mystery of the Passion*: the first portion or act took in one day of the scripture narrative; to the second, extending from the baptism to the crucifixion, four days were allotted; and to the third and concluding portion, six days. On its first performance in 1398, it was received with the greatest enthusiasm, and speedily became a popular favourite; so much so, that it led to the establishment of a permanent theatre, in which daily representations took place.

Amid much that is rude and quaint, this Mystery of the Passion contains some germs of poetry, and delicacies of expression, the more remarkable when contrasted with the rough setting by which they are surrounded. It is, however, somewhat difficult to account for the prodigious favour in which these spectacles were held, devoid as they are of the scenery and decorations which, in the present day, constitute the principal attraction of the drama. Perhaps the superstitions of the age, combined with an unreflecting religious feeling, may have contributed to excite popular admiration for what would now be wearisome to all. The traces of poetry to which we have referred, are found in the scene of the Shepherds, of whom three hold a rhymed dialogue, expressive of the delights and pleasures of a pastoral life, and their superiority to the pursuit of arms, or wealth which bringeth care. Aloris, the first speaker, says:—

"For shepherds now is season sweet,
Heav'n be thanked, as is meet."

To this Ysambert adds:—

"When shepherds meet in reason,
It is ever sweet season."

Pellion, the third shepherd, continues—

"In the house I could not stay,
And behold this joyous day,
Aloris. Fie for care and covetrie,
No life, pampered though it be,
Is worth the life of pastorie.
Pellion. Shepherds, who can happy be,
Fie for care and covetrie."

We have already seen, in the prologue to the Chester

Mysteries, that a little humour was sometimes thrown in, to enliven the solemnity of the play; so here we have Riffard, the wag of the piece, whose name literally rendered signifies *jack-plane*, saying:—

"I grey-bearded crying still—
Shepherds, I with you agree,
When of bread I have my fill—
Fie for care and covetrie.
Pellion. Some vaunt of grand seigneurie,
With donjon towers and weaponry.
Delight is none more true, than yields
The sight of pleasant fields,
Lambs leaping on the glad prairie."

The above quotation displays some appreciation of the real value and beauty of rural pursuits: the scene, however, between Judas and Lucifer in the same play, shows that the old authors could also be serious and tragical when it suited their purpose in the long evangelical dramas. The wrathful demon appears to the despairing disciple, and asks:—

"Wretch, what shall be done to thee?
Whither wilt thou now depart?
Judas. I know not; for eye of mine
Dares not to look upon the heavens.
Demon. Desirest thou to ask my name?
Briefly shalt have demonstration.
Judas. Whence comest thou?
Demon. From the nether hell.
Judas. What is thy name?
Demon. Despair.
Judas. Terribility of vengeance!
Horribility of danger!
Approach, receive my allegiance,
If death will abate my misery."

This passionate and abrupt dialogue was well calculated to make a powerful impression on the minds of the spectators, and bears evident proofs of dramatic genius. The *Miracle of Theophilus* is another of the religious dramas based upon the supernatural and the terrible. Originating in the East about the sixth century, such was its effect upon the popular mind, that the guilds and corporations of every trade painted the walls of their halls, the windows, and panels, with the exemplary details of the legend, in which a priest, seduced by pride and ungovernable ambition, denies his faith, and devotes himself to the service of the evil one: the *dénouement*, however, records his penitence and reconciliation with the church. On some occasions the auditors were entertained by an exhibition of ventriloquism; one of the plays, entitled, "The Discourses of the Three Quick and the Three Dead," was recited by a single actor, who changed the tone of his voice in accordance with the change of characters. In the *Mystery of the Resurrection* we meet with errors similar to those quoted from the Towneley Mysteries. One of the soldiers is made to say that, whether he obtain absolution from the priest or not, he will kill the first who approaches. The solecism of introducing a Romish priest in the days of Herod is not the only one, for in another place Caiaphas is called a *bishop*.

The mystery of the *Wise and Foolish Virgins* is an interesting specimen of the transition state of the language: many of the primitive French words are introduced among the rude and barbarous Latin: it is of the time of Henry I., the early part of the eleventh century. The prologue was originally spoken by one of the priesthood, who afterwards called out in a loud voice the names of the actors, as they successively entered and took part in the proceedings. This personage answers to our modern stage director; when the performance took place inside a church, he stood in the middle of the gallery, surrounded by the musicians. The other characters, priests and monks, clothed in the costume of their parts, sat in the stalls, waiting the moment to rise and advance to the middle of the choir, where they sang or chanted their stanzas. At the opening of the *Wise and Foolish Virgins*, a priest

(1) For a long period it was popularly believed in France, that the ampulla, (vessel of consecrated oil,) used at the coronation of Clovis, was brought down from heaven by a dove.

recites some Latin verses by way of prologue, and to give a general outline of the subject. Then enter the Wise Virgins, whom the angel Gabriel, in old Latin French, warns to "Watch, and sleep not." They continue their share of the dialogue in the same idiom, when the Foolish Virgins enter, deploring their negligence, with moving appeals to the compassion of the others, and ending each of their three stanzas with the choral complaint:—"Dolentas! chaitivas! trop i avem dormit." "Miserable, unhappy ones, too long have we slept!" The Wise refuse, and bid them despatch and buy oil; at the same time retorting upon them the chorus, "Dolentas," &c. After many fruitless and despairing entreaties, the Foolish Virgins go to the merchants, who receive them by saying, "*Domnas gentris.*"—"Gentle ladies, it is not becoming that you tarry here so long; we cannot give what you ask; hasten back to your wise sisters;" and in turn quote the complaint, "Dolentas," &c. The piece finished with the seizure and carrying off of the Foolish Virgins by demons, after their rebuke by the bridegroom. In addition to the characters enumerated, Nabuchadnezzar, the Sybil, and Virgil, are introduced to help out the moral. We shall conclude this brief sketch of the popular religious drama with a specimen of the barbarous Latin text quoted from the mystery above referred to:—

"Venit talis
Solea nobis
Cujus non sum etiam.
Tam benignus
Ut sim nusquam
Solvere corrigiam."

FRANK FAIRLEGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. IX.

THE FORLORN HOPE.

FREDDY COLEMAN was cheated of his walk that afternoon; for an old maiden lady in the neighbourhood, having read in a Sunday paper that the cholera was raging with great fury at Trincomalee, thought it as well to be prepared for the worst, and sent for Mr. Coleman to receive directions about making her will,—and he, being particularly engaged, sent Freddy in his stead, who set out on the mission in a state of comic ill-humour, which bid fair to render Mrs. Aikenside's will a very original document indeed, and foreboded for that good old lady herself an unprecedented and distracting afternoon.

I had assisted Mr. Coleman in placing Clara Saville in the carriage which arrived to convey her to Barstone, and had received a kind glance, and a slight pressure of the hand in return, which I would not have exchanged for the smiles of an empress, when, anxious to be alone with my own thoughts, I started off for a solitary walk, nor did I relax my pace till I had left all traces of human habitation far behind me, and green fields and leafless hedges were my only companions. I then endeavoured in some measure to collect my scattered thoughts, and to reflect calmly on the position I had placed myself in, by the avowal into which the unexpected events of the morning had hurried me. But so much was I excited, that calm reflection appeared next to impossible. Feeling flushed with the victory it had obtained over its old antagonist, Reason seemed, in every sense of the word, to have gained the day, and, despite all the difficulties that lay before me—difficulties which I knew would appear all but insurmountable, whenever I should venture to look them steadily in the face, the one idea that Clara Saville loved me, was ever present with me, and rendered me supremely happy.

The condition of loving another better than oneself,

conventionally termed being "in love," is, to say the least, a very doubtful kind of happiness; and poets have therefore, with great propriety, described it as "pleasing pain," "delicious misery," and in many other terms of a like equivocal character; nor is it possible that this should be otherwise: love is a passion, wayward and impetuous in its very nature,—agitating and disquieting in its effects, rendering its votary the slave of circumstances,—a mere shuttlecock alternating between the extremes of hope and fear, joy and sorrow, confidence and mistrust;—a thing which a smile can exalt to the highest pinnacle of delight, or a frown strike down to the depths of despair. But in the consciousness that we are beloved, there is none of this questionable excitement; on the contrary, we experience a sensation of deep calm joy, as we reflect, that in the true affection thus bestowed, we have gained a possession, which the cares and struggles of life are powerless to injure, and which death itself, though it may interrupt it for a while, will fail to destroy.

These thoughts, or something like them, having entrenched themselves in the stronghold of my imagination, for some time held their ground gallantly against the attacks of common sense; but at length, repulsed on every point, they deemed it advisable to capitulate, or (to drop metaphor, a style of writing I particularly abominate, perhaps because I never more than half understand what it means) in plain English, I, with a sort of grimace, such as one makes before swallowing a dose of physic, set myself seriously to work, to reflect upon my present position, and decide on the best line of conduct to be pursued for the future.

Before our conference came to an end, I had made Clara acquainted with my knowledge of Cumberland's former delinquencies, as well as the reputation in which he was now held by such of his associates as had any pretension to the title of gentlemen, and added my conviction, that, when once these facts were placed before Mr. Vernon, he must see that he could not, consistently with his duty as guardian, allow his ward to marry a man of such character. Cumberland had no doubt contrived to keep his uncle in ignorance of his mode of life, and it would only be necessary to enlighten him on that point, to ensure his consent to her breaking off the engagement. Clara appeared less sanguine of success, even hinting at the possibility of Mr. Vernon's being as well-informed in regard to his nephew's real character as we were; adding, that his mind was too firmly set on the match, for him to give it up lightly. It was finally agreed between us, that she was to let me know how affairs went on after Mr. Vernon's return, and, in the mean time, I was to give the matter my serious consideration, and decide on the best course for us to follow. The only person in the establishment whom she could thoroughly trust, was the extraordinary old footman, (the subject of Lawless's little bit of diplomacy,) who had served under her father in the Peninsula, and accompanied him home in the character of confidential servant—he had consequently known Clara from a child, and was strongly attached to her, so that she had learned to regard him more in the light of a friend than a servant. Through this somewhat original substitute for a confidante, we arranged to communicate with each other.

As to my own line of conduct, I very soon decided on that. I would only await a communication from Clara to assure me that Mr. Vernon's determination with regard to her remained unchanged, ere I would seek an interview with him, enlighten him as to Cumberland's true character, acquaint him with Clara's aversion to the match, and induce him to allow of its being broken off. I should then tell him of my own affection for her, and of my intention of coming forward to demand her hand, as soon as by my professional exertions I should have realized a sufficient independence to enable me to do so. As to Clara's fortune, if fortune she had, she might build a church, endow a hospital, or buy herself a

(1) Continued from p. 236.

ribbons with it, as she pleased, for not a farthing of it would I ever touch on any consideration. No one should be able to say, that it was for the sake of her money I sought to win her.

Well, all this was very simple, straight-forward work;—where, then, were the difficulties which had alarmed me so greatly? Let me see—Mr. Vernon might choose to fancy that it would take some years to add to the 90*l.* 14*s.* 6*d.* sufficiently to enable me to support a wife, and might disapprove of his ward's engaging herself to me on that account—what if he did? I wished for no engagement—let her remain free as air, her own true affection would stand my friend, and on that I could rely, content if it failed me, to—to—well, it did not signify what I might do in an emergency which never could arise.—No! only let him promise not to force her inclinations—to give up his monstrous project of wedding her to Cumberland, and to leave her free to bestow her hand on whom she would, and I should be perfectly satisfied. But, suppose, as Clara seemed to fear, he should refuse to break off the engagement with his nephew—suppose he should forbid me the house, and, taking advantage of my absence, use his authority to force on this hateful marriage! All that would be extremely disagreeable, and I could not say I exactly saw at the moment, what means I should be able to employ, effectually to prevent it;—still it was only a remote contingency—an old man like him, with one foot, as you might say, in the grave, (he could not have been above sixty, and his constitution, like everything else about him, appeared of cast iron,) must have some conscience, must pay some little regard to right and wrong: it would only be necessary to open his eyes to the enormity of wedding beauty and innocence such as Clara's to a scoundrel like Cumberland—a man destitute of every honourable feeling—oh! he must see that the thing is impossible, and, as the thought passed through my mind, I longed for the moment when I should be confronted with him, and able to tell him so.

And Clara, too! sweet, bewitching, unhappy Clara! what must not she have gone through, ere a mind naturally buoyant and elastic as hers, could have been crushed into a state of such utter dejection, such calm, spiritless despair! her only wish, to die—her only hope, to find in the grave a place “where the wicked cease from troubling, and where the weary are at rest!” But brighter days were in store for her,—it should be my ambition to render her married life so happy; that, if possible, the recollection of all she had suffered having passed away, her mind should recover its proper tone, and even her lightness of heart, which the chill atmosphere of unkindness for a time had blighted, should revive again in the warm sunshine of affection.

Thus meditating, I arrived at Elm Lodge, in a state of feeling containing about equal parts of the intensely poetical, and the very decidedly hungry.

On the second morning after the events I have described, a note was brought to me whilst I was dressing;—with trembling fingers I tore open the envelope, and read as follows:—

“I promised to inform you of what occurred on my return here, and I must therefore do so, though what I have to communicate will only give you pain:—all that my fears pointed at has come to pass, and my doom appears irrevocably sealed. Late on the evening of my return to Barstone, Mr. Vernon and his nephew arrived; I never shall forget the feeling of agony that shot through my brain, as Richard Cumberland's foot-step sounded in the hall, knowing, as I too well did, the purpose with which he was come; I fancied grief had in great measure deadened my feelings, but that moment served to undeceive me—the mixture of horror, aversion, and fear, combined with a sense of utter helplessness and desolation, seemed as it were to paralyse me.

“But I know not why I am writing all this,—the penning ceased off without any thing particular taking place.—Mr. Cumberland's manner towards me was re-

gulated by the most consummate tact and cunning, allowing the deep interest he pretends to feel in me to appear in every look and action, yet never going far enough to afford me an excuse for repelling him. This morning, however, I have had an interview with Mr. Vernon, in which I stated my repugnance to the marriage as strongly as possible; he was fearfully irritated, and, at length, on my repeating my refusal, plainly told me that it was useless for me to resist his will,—that I was in his power, and if I continued obstinate, I must be made to feel it. Oh! that man's anger is terrible to witness; it is not that he is so violent—he never seems to lose his self-control—but says the most cutting things in a tone of calm, sarcastic bitterness, which lends double force to all he utters. I feel that it is useless for us to contend against fate; you cannot help me, and would only embroil yourself with these men, were you to attempt to do so. I shall ever look back upon the few days we spent together, as a bright spot in the dark void of my life,—that life which you preserved at the risk of your own. Alas! you little knew the cruel nature of the gift you were bestowing. And now, farewell for ever! That you may find all the happiness your kindness and generosity deserve, is the earnest prayer of one, whom, for her sake, as well as your own, you must strive to forget.”

“If I do forget her,” exclaimed I, as I pressed the note to my lips, “may I — well, never mind, I'll go over and have it out with that old brute this very morning, and we'll see if he can frighten me;” and so saying, I set to work to finish dressing, in a great state of virtuous indignation.

“Freddy,” inquired I, when breakfast was at length concluded, “where can I get a horse?”

“Get a horse?” was the reply. “Oh! there are a great many places,—it depends upon what kind of horse you want:—for race-horses, steeple-chasers, and hunters, I would recommend Tattersall's; for hacks or machines, there's Aldridge's, in St. Martin's-lane; while Dixon's, in the Barbican, is the place to pick up a fine young cart-horse—is it a young cart-horse you want?”

“My dear fellow, don't worry me,” returned I, feeling very cross, and trying to look amiable; “you know what I mean; is there any thing rideable to be hired in Hillingford?—I have a call to make which is beyond a walk.”

“Let me see,” replied Freddy, musing; “you wouldn't like a very little poney, with a rat-tail, I suppose—it might look absurd with your long legs, I'm afraid,—or else Mrs. Meek, the undertaker's widow, has got a very quiet one, that poor Meek used to ride—a child could manage it:—there's the butcher's fat mare, but she won't stir a step without the basket, and it would be so troublesome for you to carry that all the way. Tomkins, the sweep, has got a little horse he'd let you have, I dare say, but it always comes off black on one's trousers; and the miller's cob is just as black the other way with the flour. I know a donkey—”

“So do I,” was my answer, as, laughing in spite of myself, I turned to leave the room.

“Here, stop a minute!” cried Freddy, following me, “you are so dreadfully impetuous; there's nothing morally wrong in being acquainted with a donkey, is there? I assure you I did not mean any thing personal—and now for a word of sense. Bumpus, at the Green Man, has got a tremendous horse, which nearly frightened me into fits the only time I ever mounted him, so that it will just suit you; nobody but a green man, or a knight errant, which I consider much the same sort of thing, would patronize such an animal—still, he's the only one I know of.”

Coleman's tremendous horse, which proved to be a tall, pig-headed, hard-mouthed brute, with a very decided will of his own, condescended, after sundry skirmishes, and one pitched battle, occasioned by his positive refusal to pass a windmill, to go the road I

wished, and about an hour's ride brought me to the gate of Barston Park.

So completely had I been hurried on by feeling in every stage of the affair, and so entirely had all minor considerations given way to the paramount object of securing Clara's happiness, with which, as I now felt, my own was indissolubly linked, that it was not until my eye rested on the cold grey stone of Barstone Priory, and wandered over the straight walks and formal lawns of the garden, that I became fully aware of the extremely awkward and embarrassing nature of the interview I was about to seek. To force myself into the presence of a man, more than double my own age, and, from all I had seen or heard of him, one of the last people in the world to take a liberty with, for the purpose of informing him that his nephew, the only creature on earth that he was supposed to love, was a low swindler, the associate of gamblers and blacklegs, did not appear a line of conduct exactly calculated to induce him, at my request, to give up a scheme on which he had set his heart, or to look with a favourable eye on my pretensions to the hand of his ward. Still there was no help for it; the happiness of her I loved was at stake, and, had it been to face a fiend, instead of a man, I should not have hesitated.

My reflections were here interrupted by a cock-pheasant, which, alarmed at my approach, rose immediately under my horse's nose; an unexpected incident, which caused that brute to shy violently, and turn short round, thereby nearly unseating me. Having by this manoeuvre got his head towards home, he not only refused to turn back again, but showed very unmistakable symptoms of a desire to run away. Fortunately, however, since the days of "Mad Bess," my arms had grown considerably stronger, and, by dint of pulling and sawing the creature's apology for a mouth with the bit, I was enabled to frustrate his benevolent intentions, and even succeeded in turning him round again—but here my power ceased—for in the direction of the Priory by no possibility could I induce him to move a step. I whipped and spurred, but in vain; the only result was a series of kicks and plunges, accompanied by a retrograde movement, and a shake of the head, as if he were saying, No! I next attempted the soothing system, and lavished sundry caresses and endearing expressions upon him, of which he was utterly undeserving, but my attentions were quite thrown away, and might as well, for any good they produced, have been bestowed upon a rocking-horse. At length, after a final struggle, in which we were both within an ace of falling into a water-course, or brook, which crossed the park in that direction, I gave the matter up as hopeless; and, with a sigh (for I love not to be foiled in anything I have attempted, and moreover I could not help looking upon it as an unlucky omen) dismounted, and leading my rebellious steed by the rein, advanced on foot towards the house. As I did so, a figure abruptly turned the corner of a shrubby walk, which ran at right angles to the road, and I found myself face to face with Richard Cumberland!

For a moment he remained staring at me, as if he scarcely recognised me, or was unwilling to trust the evidence of his senses, so confounded was he at my unexpected apparition; but, as I met his gaze with a cold stern look, he seemed to doubt no longer, and advancing a step towards me, said, in a tone of ironical politeness, "Is it possible that I have the pleasure of seeing Mr. Fairleigh?"

"None other, Mr. Cumberland," returned I, "though I could hardly have flattered myself that my appearance would have recalled any very pleasurable associations, considering the last two occasions on which we met."

"Ah! you refer to that unfortunate affair with Wilford," replied Cumberland, purposely misunderstanding my allusion to Dr. Mildman's.—"I had hoped to have been able to prevent the mischief which occurred, but I was misinformed as to the time

of the meeting—I trust our friend Oaklands feels no ill effects from his wound?"

"Mr. Oaklands, I am sorry to say, recovers but slowly; the wound was a very severe one," returned I coldly.

"Well, I will not detain you any longer, it is a lovely morning for a ride," resumed Cumberland; "can I be of any assistance in directing you? the lanes in this neighbourhood are somewhat intricate,—you are not perhaps aware that the road you are now following is a private one."

"Scarcely so private that those who have business with Mr. Vernon may not make use of it, I presume," rejoined I.

"Oh! of course not," was the reply, "I did not know that you were acquainted with my uncle; though now I come to think of it, I do recollect his saying that he had met you somewhere; he seldom receives visitors in the morning;—in fact, when I came out, I left him particularly engaged:—perhaps I can save you the trouble of going up to the house; is there any message I can deliver for you?"

"I thank you," replied I, "but I do not think the business which has brought me here could be well transacted through a third person; at all events I will take my chance of being admitted:—"I paused, but could not refrain from adding, "besides, if my memory fails not, you were a somewhat heedless messenger in days of yore."

This allusion to his embezzlement of Oakland's letter stung him to the quick; he turned as white as ashes, and asked in a voice that trembled with passion, "Whether I meant to insult him?"

"I spoke heedlessly, and without deliberate intention," I replied, "but perhaps it is only fair to tell you, that for the future there can be no friendly communication between us; we must either avoid each other altogether, which would be the most desirable arrangement, or meet as strangers. The disgraceful conduct of the boy I could have forgiven and forgotten, had not its memory been revived by the evil deeds of the man. Richard Cumberland, I know you thoroughly; it is needless for me to add more."

As I spoke, his cheek flushed, then grew pale again with shame and anger, while he bit his under lip so severely, that a red line remained where his teeth had pressed it. When I concluded, he advanced towards me with a threatening gesture, but, unable to meet the steadfast look with which I confronted him, he turned abruptly on his heel, and muttering, "You shall repent this," disappeared among the shrubs.

ERAS OF ENGLISH CIVILIZATION.¹

WHATEVER has imparted beauty, or secured strength to the British constitution, must, directly or indirectly, be traced to the influence of our parliament, in which king, lords, and commons, concur in the work of disciplining a nation for the struggles to which it may be summoned. The civilization of England has naturally arisen out of the peculiar principle of that constitution, which has saved us from despotism, on the one hand, and from anarchy, on the other. Wide, therefore, must his survey be, who takes into one field of view all the vast results of the era we are now contemplating, without which all other periods would have contributed little to the real prosperity of the land. When, therefore, we look on the busy past, or contemplate the coming ages, and ponder over the undeveloped epochs of the world's civilization, let us remember that one marked era, the famous thirteenth century, when the great preservative principle in the politics of England first rose into action. Colonies, in all regions of the globe, have sown, and are sowing, the seeds of other civilizations over the wastes of savage nature; and thus, at

some future period, the historian of the South Sea Isles, or some Australian legislator, may look back to the origin of our parliament as the cause of prosperity and happiness to more than one-half the inhabitants of the globe.

When we consider the extensive regions of the East, the South, and the West, over which the English language is spoken, it is evident that the civilization of the whole world must be shaped, to a great extent, by the peculiarities of English life and customs. The plain conclusion is, that the era of the rise of our parliament must be viewed as operating not only within the four seas of Britain, but over the length and breadth of the Old and New Worlds. The civilization of the greater part of Asia will, probably, be modified by that of India; whilst the progress of the latter in arts and laws must be directed by the agencies of the English constitution. America, again, will probably follow, at no distant time, the spirit of the systems, exhibited in Canada and the United States; in either of which cases English civilization must be regarded as the parent stream from which the fertilizing agencies flow over the earth. What an ever verdant wreath of glory is all time thus preparing for the name which must remain connected with the era of English parliaments! What avails it that the body of the great De Montfort was once brutally mutilated by his savage foes on the field of Evesham, when many nations will preserve his undying memorials in the principles and forms of their national existence?

4. THE ERA OF THE ENGLISH LEGAL SYSTEM.

The last section brought before us an era relating to the *primary* elements of civilization; this claims our attention to a series of details subsidiary to the causes just described. If a well-balanced representative system be compared to some deep spring, ever pouring forth the riches of intelligence and liberty; law may be likened to the channels and dykes which preserve the accumulated waters within their desired course. What would a nicely adapted representative system have accomplished in presence of a feeble, confused, or corrupt jurisprudence? Acts of Parliament are but waste paper until impressed by the seal of the judge, and the decisions of a court. Trial by jury—open courts of justice—the co-ordinate jurisdiction of several independent courts—the constant watchfulness of a trained body of lawyers—and the numerous securities provided for the protection of the subject,—are the defences thrown up in past ages against the encroachments of arbitrary power or the excesses of an undisciplined democracy. How much the civilization of the land has been promoted by *fixed* laws, administered by supreme courts, can only be fully estimated by those who have witnessed the disorganization flowing from a contrary system. Time was when right was at the mercy of an ignorant or malicious baron, who required all disputes within his domain to be tried in his own courts. In such places the will of the lord was law; and thus the feudal baron was absolute within his estate, and mimicked within his petty court the terrors and majesty of the imperial sceptre. All this it was necessary to supersede by the great tribunals of the kingdom, before civilization could dwell securely in the land. But the workings of such courts required the co-operation of a large body of men, trained to the consideration of legal subjects, and versed in the national laws. The rise of such a body, and its confederation in regular societies, must be regarded as the commencement of the era now under consideration.

This happened in the fourteenth century, when the inns of court were formed in the metropolis, under the patronage of the first and second Edwards. The Englishman who walks through the great square of Lincoln's Inn, and passes thence to the Inner and Middle Temple, ending with the Inn named from the Lords Gray of Wilton, would do well to reflect on the almost incalculable

aid rendered to civilization by these great corporations. Without them nothing like a compacted system of national law could have arisen, and we must have suffered all the checks to civilization arising from the absence of a code suited to the peculiar requirements of the country, or from the presence of a foreign system,¹ which, though excellent in parts, must have seriously modified the character of the people of England. The feeling of independence, and of resistance to wrong, which characterize Englishmen, must be traced to the operation during many ages of the national laws on the habits of the people. Deference to authority is one sure means of securing the advance of a nation in prosperity; and Ireland is at this moment a terrible illustration of the prostration which may befall a people who feel the workings of no such principle. But to produce and support this feeling, the laws themselves must be interpreted and administered on principles suited to the wants of the nation; and this England had secured in ages past by the constitution of her courts, and the organization of her bar. If the long line of statutes and the legion of reports terrify the student who is ambitious of grasping the whole of the vast system, the spectacle may, on the other hand, delight the poorest member of the community whose rights are defined and guarded by the provisions of those ponderous tomes. It is the system of English law which has delivered us from the tyranny of a hundred petty codes; which has saved us from the operations of the wager by battle, and the trial by ordeal, whilst no imperious prince can again sport with the liberties and rights of Englishmen, by setting up his proclamations above the laws. The beggar sleeps securely in his poor hut through which the storm may beat, but where not even the sovereign of the land has a right to enter save at the bidding of the law; and it is this firm security for the weak which has made England the refuge of industry, arts, and wealth, and therefore the home of a most vigorous civilization. To trace the growth of our vast legal system, since the period when the inns of court were incorporated, is impossible in this place; our object is not a history of law, but a survey of the causes which have promoted the growth of the British empire in all the essentials of national greatness.

5. ERA OF ENGLISH LITERATURE.

If the fourteenth century was distinguished by the formation of the legal corporations, by which our liberties have been asserted and maintained, the next age was characterised by the uprising of that mighty art which has given power and perpetuity to all the rest. Caxton was born in the beginning of this century, 1410, or 1412, and, having set up on one memorable day his world-famed press in Westminster Abbey, began to teach his country another great lesson in civilization. The mind of England was thus prepared to take advantage of the light shed over Europe by the downfall of Constantinople, and the dispersion of the Grecian scholars through every state and kingdom. Whatever some may think of the works actually published by Caxton, and however lightly the student may estimate their importance, let it not be forgotten, that his books were the pioneers of those which now enrich our noblest libraries, and speak to the soul in the eloquent accents of ancient and modern wisdom. Some who smile at his books on the "Game of Chess," his "Noble History of King Arthur," the "book of the whole Life of Jason," must admit that the old printer did nevertheless good service, by directing the public mind to the important studies suggested by such a work as "The Chronicles of England," and the more general narrative entitled "Polychronicon," the rude style of which Caxton popularised. Great also was the impulse given to the national thoughts by the pub-

(1) Such as the Roman law.

lication of French translations from the classics, by which Englishmen were early familiarised with the bold ideas and elevating sentiments which once fired the hearts of Rome's noblest sons.

But we do not regard Caxton so much for his own doings, as for the results produced in all succeeding ages by his labours. The beginnings of literature in his time may seem 'small; and there were doubtless many who listened with sneers to the crank of the solitary press in the old abbey as it toiled on slowly producing works which seemed, to prejudiced eyes, far less beautiful than the old illuminated MSS., elaborated by the handicraft of patient monk and scribe. But that simple press is the honoured father of the steam-printing machine, which now dispenses the intellectual food of millions in a few hours every morning.

Were Caxton's machine placed by the side of *The Times*' press, how little notice would it attract, save from those who can trace the spreading glories which from his age diffused over the mental firmament the light and warmth of knowledge. From the establishment of that machine in the abbey, knowledge was furnished with wings, not for the purpose of eluding but seeking men. Thoughts long pent up in the form of costly and rare manuscripts emerged from the gloom of their ancient cells, and rose into the pure heavens, where, for ages, they have blazed sun-like before men.

Wynkyn-de-Worde and Richard Pynson, the devoted friends and companions of the first English printer, took up the holy work when Caxton died, and sent, in more than six hundred distinct books, bright forms of truth into the halls of nobles, the parsonage of the priest, and the burgher's home; training up that generation for the great struggle so soon to startle Europe. Then printers and authors began to multiply, and so numerous did the former become that the names of three hundred and fifty are given by Bibliographers between the time of Caxton and the end of the ensuing century, whilst above ten thousand works were published in the same period, attesting the awakening of the nation, and the rapid advance towards civilization, produced by the development of a literary spirit amongst the people. As we proceed to later times, and find ourselves surrounded by the struggles attendant upon the Reformation, and the bitter contests of the civil wars, we see thoughts and books multiplying, as if, amidst the perplexities and shakings of the nations, lights rose up from the trembling earth, or descended from the troubled heavens, to guide bewildered men into paths of peace and homes of rest. It is to be regretted, that so much of this literature should have been devoted to theological and secular strife, and that 30,000 tracts upon such subjects should have been published during the short space of twenty years, from 1640 to 1660. But all this effort was not lost work; something was gained from such an incessant collision of minds by which subsequent times were extensively affected; so that many of our present national habits may be traced to the feelings excited during these long contests. But, amidst the din raised by meaner spirits, three bright forms had risen far above the dusty clouds into the regions of a loftier literature. The stars of Spenser, Shakspeare, and Milton, beamed with a refulgent splendour over the troubled waters, and guided by their gentle influence the spirits of men to nobler objects.

To pursue the course of our literary progress, and its varied operations on our complicated civilization, will be deemed needless. It is enough to have indicated the fountain head whence such waters of life flowed, and by the taste of which a host of ardent spirits, in these ages, have been impelled in the pursuit of a higher good than their fathers knew. Amongst all the eras named in this article none are more important than this concerning which we now treat; for a nation without a literary era must ever remain amongst the rude communities from whose barbarous seats of power little save desolating

lating wars can proceed. To have had the beginnings of such an era, and still to possess its fruits, are the surest omens of a long and triumphant progress upwards, till that point is gained where something resembling the bright visions of the golden age may visit the homes of men.

Amidst these reflections on the past, and anticipations of the future, some observer of things *as they are* may look down into the dark abyss of modern society, and inquire whether civilization is *there*; there, where untutored thousands crouch in pestilential corners of populous human hives, and over whom so little of the pure breezes from a better land has breathed? But stop, and reflect upon the *causes* of this misery, ere you give up, gloomy observer, all hopes of amelioration for those beings. Has not literature, with all its purifying, life-rejoicing truths, been to them a thing unknown? and has not their poverty been thus deepened into a fearful gloom and wretchedness by the thick shadow of ignorance? If *this* could be removed; if for them an era of knowledge were to arise, the results would be as favourable in the dwellings of our mechanics and peasants as upon the surface of England in general. Civilization will not, *cannot* penetrate through the recesses of society, until knowledge prepares the minds of all to appreciate aright their position, and judge aright of their duties. Four centuries of stirring events have passed away since Caxton originated the era of English literature, and yet much remains to be done for the mass of the lower orders. But let us hope this era will go on increasing in brightness and power until the humble and lowly are brought within its lasting influence.

6. ERA OF THE REFORMATION.

The character of a people must partake of the peculiarities of their religious systems, for it is impossible that themes so commanding in their nature should fail to impress the minds of men. This remark will be confirmed and illustrated by a reference to the religious systems of ancient or modern states, of civilized or savage tribes, and is peculiarly exemplified in the history of European nations. The most remarkable religious era in England was undoubtedly that of our Reformation, whether we consider the circumstances attending its birth, the vast results produced by its operations, and their extensive influence on the most distant nations which have been connected with the commerce or politics of England. One of the most decided peculiarities imparted to the English mind by this great epoch is an intense religious earnestness developed *individually*, but limited by the church system of the people, which links them by many of its forms and services with the ancient ages of Christianity. This stern individuality which leads men to set up *some* power within the heart as the final arbiter of all debates, and for which they will zealously do battle as for their liege sovereign, marks the *puritanical* element so strongly developed in the English character. As this moral peculiarity must be noted when reviewing the nature of our civilization, so it is forced upon our attention by some of the most momentous events in our history. The civil wars and the ultimate fall of the Stuart princes, our relations with the Protestant powers of Europe, and the system of foreign policy introduced by William III., are all direct results of the uncompromising religious element infused by the Reformation. And how important have been the consequences of this feeling within the country itself can be fully comprehended only by those who survey with a careful and dispassionate mind the changes in our history since the time of Elizabeth, and the present energies at work amongst the people.

The attitude of *conflict* ever kept up towards Rome, has modified in a remarkable manner the character of English civilization, and stamped upon our laws and manners some of those deeply graven principles and peculiarities which amaze the foreigner. It is difficult

to say how much of the present complication of Irish politics has been caused by the incessant actings of puritanical sternness, but it is evident that the condition of that country has been affected in most important particulars by laws and regulations dictated by this feeling. That such should have been the case was perfectly natural; for it was not in the nature of things for a reflective and determined people to pass through such critical events as the Marian burnings, the attack of the Spanish Armada, the gunpowder plot, the tempest of the great rebellion, the change in the royal succession, when adherence to Rome cost James II. a crown, and the struggles against the partisans of the excited Stuarts, without feeling their whole nature steeled into hardihood towards the system of the papacy. Hence the restrictive laws against the Roman Catholics in England, but especially in Ireland, from which, at the present day, such fruits have been produced as few can contemplate with undisturbed minds. This hostile spirit towards the power of the Italian hierarchy was forced, be it remembered, upon the country by events which arose as clearly from the agency of Providence as any phenomena ever developed upon the face of the earth, and by the unwise, if not wicked, machinations of the men, who in those times directed the workings of Romanism. Whatever evils, therefore, may have followed the unchecked action of the puritanical principle, the feeling itself is not to be classed with the errors, but numbered amongst the characteristics, of our civilization. Much of the practical earnestness, distinguishing the English as a people, must be traced to the spirit roused into such action by the Reformation, and its direct consequences. And for ages to come this same principle will continue to work powerfully in the politics of the nation; for, whatever modifications may result from the eclecticism now pervading a large section of our public men, and so likely to become predominant in some states of Europe, we cannot expect the people of England to abandon views which have become a part of their moral constitution, and are interwoven with the most stirring periods of their annals. The present contests prevailing amongst us indicate the vigour of that determined Protestantism which has survived unbroken amidst the changes and shocks of parties.

The mild and comprehensive theology of the Anglican Church, ever seeking to develop the principles of Catholicism without Romanism, has modified the one-sidedness of the mere reformer, and given to the Englishman a sympathy with the principles of primitive times. English civilization has, therefore, received from the Reformation a mixed character, uniting opposition to Rome with a considerable degree of respect for the practices and teachings of the early church. We are, notwithstanding all our self-reliance, a people disposed to rest upon tradition to a very considerable extent,—a tendency abundantly developed in the practice of our courts of law, and the deliberations of parliament; in both of which precedent is ever held up to view; and woe betide the lawyer or the statesman who should wholly despise the lessons taught by our ancient records: not the genius of a Pollett in the one case, nor the commanding energies of a Pitt in the other, would secure such an one from being borne down by the indignation of his countrymen. This spirit has been to some extent preserved by the formularies of our church; and it is not, therefore, probable that England will ever suffer herself to be carried away either by the violence of abstract puritanism, or the errors of Rome. We are thus placed by the Reformation between two extremes, and our civilization has unquestionably been materially modified by the results of the great religious change through which we passed in the sixteenth century.

Freedom of speculation, limited by practical considerations, is another characteristic of English civilization traceable to the influence of the Reformation. He who considers the speculations of the English philoso-

phers, or even the views of our infidels, will observe a marked difference between their reasonings and those of the continental speculators. Amongst the latter the mind seems released from all respect for authority, and the theorist advances from one delusion to another with the feeling that all things are wrong, and he is born to set them right. Something of this spirit is often seen in our dissenting communities; but in general a considerable degree of caution is exercised by the English mind when treating of the mysterious subjects pertaining to religion and morals. This reticence in of our fiercest spirits, and the consequent effects upon the national mind, must be ascribed to the peculiarly mixed principles of our Reformation. When we consider the important consequences often produced by unrestrained speculation, and the fierce excitement to which the ferocity of a Voltaire, or the theories of a D'Holbach or a Helvetius, may lead a nation, we cannot refrain from rejoicing over the more practical character imparted to our metaphysicians by the religious character stamped upon the land during the era of which we are now treating; therefore it is that we have hitherto escaped the wildness of the German, and the freezing coldness of the French philosophy. Our adherence to records, and reverence for primitive practices, have been the restraining agencies which have given to the freest nation upon earth a moderation so rarely exercised, and so hardly learned by men. The influence of the Reformation must, therefore, be highly prized by those who have learned to estimate national progress aright, and who can note the difference between the feverish movements of a false, and the steady advance of a genuine, civilization.

(To be continued.)

BERTHA'S WALK.

A TALK.

ONCE upon a time there lived near the borders of an extensive forest in the southern part of Germany, a poor widow named Gertrude Hauff, and her little daughter Bertha.

Gertrude supported herself and her child by her spinning, and four times every year she and Bertha went to a small town about two leagues distant, to dispose of the produce of her industry, and to purchase the few articles of food and clothing which their simple habits rendered necessary. These periodical visits were always looked forward to with eager delight by the little girl; they were the great events of her life,—the bright stars in her calm and cloudless sky.

It was the evening of a beautiful day in October, the setting sun shone brightly through the lattices, and rested on the glowing cheek and glossy golden curls of the fair child, as if to set forth, if possible more strongly, the striking contrast between their brilliant beauty, and the dark mourning dress and careworn features of her mother, who sat gazing with all a mother's fondness upon the elastic form and the bright laughing eye of the little maiden, as she bustled herself in tying up, and arranging in large bundles, the skeins of homespun thread, which Gertrude produced from a press that stood in one corner of her neat little kitchen.

"I hope we shall have a fine day for our walk to-morrow, mother," said Bertha, as she finished unravelling a tangled mass of thread, and laid it in triumph on the table. "We shall have a large basket full to take this time, but I can carry it all the way; you know, mother, the last time we went, you were tired, and I was not." She stopped abruptly, for as she looked up into her mother's face she observed the

melancholy smile with which she listened to her daughter's merry prattle.

"Dear mother, you are not well, you would rather not go?"

"I am not well," answered Gertrude; "but I must go, or how could the thread be sold?"

"Let me go alone," cried Bertha, pausing in her employment, and looking earnestly in her mother's face, "I know the way perfectly, and you know I am ten years old; dear mother, please to let me go instead of you," she continued, as she threw her arms round her mother's neck and kissed her pale cheek.

"But the forest, Bertha; you will lose your way, or some harm will happen to you; I cannot let you go alone."

But Bertha urged so earnestly and so tenderly, the necessity of her mother's staying at home till her health was stronger, and explained so clearly the road she was to take through the portion of the forest which she would have to pass, that her mother at last yielded a reluctant consent; and Bertha lay down to rest that night, happy in the consciousness that she was old enough to be of some use, and steady enough to be trusted.

The next morning she rose early, and was soon ready to set forth upon her journey. Gertrude almost repented having given her consent; but she felt her own strength quite unequal to so long a walk, and knowing that for her child's sake it was her duty, if possible, to preserve her own life, she made no further opposition, and, giving Bertha the basket containing the thread, and a small oaten cake to serve as provision on the road, she repeated her injunctions to her, to return early, that she might not be overtaken by the close of the short autumnal day, before she had passed through the forest; and kissing her affectionately, and commending her to the care of Him who is the Father of the fatherless, she watched the little figure, until it became less and less, and finally disappeared amongst the trees; and then she returned to her lonely dwelling, to renew her prayers for the safety of her darling child.

Bertha tripped merrily along; the sun broke gradually through the mist which had hitherto shorn it of its rays, and beamed forth in all its brightness, making the dew-drops glitter like diamonds; and the birds chanted their matin hymns, and hopped from bough to bough, and as their rainbow plumage glanced in the sunshine, they looked down upon Bertha with their bright eyes, till the little girl almost fancied that they were beautiful spirits of the wood, sent to be her companions on her lonely pilgrimage: and unconsciously, she raised her soft, clear child-like voice, and joined in their song.

Bertha walked on for a considerable time, and at last she began to feel somewhat weary, so she sat down on one of the large projecting roots of a lofty tree, which formed a convenient resting-place, and taking her little cake out of her basket she ate a part of it, and put the remainder back, intending to keep it till evening.

It was a pleasant cool spot like a bower, where Bertha had chosen her resting-place; there was a gentle breeze just stirring the leaves on the trees, and softly fanning her cheek; she took off her large straw hat, and, having laid it on the grass beside her, she gathered some of the flowers which formed a carpet at her feet, and amused herself with twining them into a garland.

Bertha had been for some time employed in this manner, when she suddenly observed something moving, near the foot of a tree at a little distance. She watched it for some moments, and then she perceived that it was a squirrel. She approached softly and cautiously, and as she came nearer it moved slowly to a short distance, but it did not hop away, or climb up into a tree, as she expected, so she came still nearer, and then she saw that the little creature was scarcely able to stir; it appeared to be either very ill, or to have received some injury. "Poor little thing," said Bertha, "it is

so weak it cannot run about to get its food as usual, and it is dying of hunger; I wonder if it would eat some of my cake?" and so she ran back and fetched the piece of cake out of her basket, and breaking it into small bits, she scattered it about on the ground, near to where the squirrel lay. She would not go quite close for fear of frightening it; then she retired to her old place under the tree, and she soon had the pleasure of seeing the little animal crawl slowly from one place to another, picking up the crumbs, and eating them with great apparent satisfaction.

Bertha now recollected that it was time to proceed on her journey; so tying on her hat, and taking her basket in her hand, she walked on as gaily as ever, quite refreshed by her long rest under the tree.

Before she had gone very far she observed a little worm lying just in her path. She stepped to one side to avoid treading on it, and walked on; but presently she said to herself "perhaps somebody may pass this way, who may not see that poor little worm, and then it will be killed," so she went back and taking it up very gently, she laid it down amongst the grass at some distance from the path. As she did so, she could not help remarking what a curious little worm it was; she had never seen one like it, it was not an earth-worm, nor a caterpillar, nor a snail, it was about half an inch long, and of a white fleshy colour, quite unlike any other worm she had ever seen—what could it be?

The sun was now high in the heavens, and it penetrated even through the deep shade of the trees, and Bertha knew that it was mid-day, and she walked on rapidly, for she had still some distance to go.

She had not proceeded far, when the shrill note of a bird, loud, and quickly repeated, struck upon her ear; it sounded like a cry of pain or distress. Bertha listened, and looked in the direction whence the sound came, but she could discover nothing; still the note was repeated, louder and more rapidly, as though the poor bird knew that a gentle heart was near, and was appealing to it for aid. After spending some time in vainly pushing aside the thick underwood, and peering up amongst the branches of the lofty trees, Bertha came suddenly upon the object of her search.

It was a beautiful bird; its plumage was of the brightest blue, and on its head was a yellow crest, that glittered like gold. It remained in the same place, only fluttering its wings, and uttering its shrill cry of distress. As Bertha approached, she perceived that it had been caught in a fowler's snare. After many efforts she succeeded in disentangling the wires, and the captive spread its bright wings, and flew high up into the air, with a wild song of joy.

Bertha once again continued her journey, and arrived without further interruption at the town. She sold her mother's thread, executed the other commissions with which she had been entrusted, and some time before sunset she set out on her return.

It was a warm bright autumnal evening, but the rays of the setting sun, glittering through the yellow leaves, warned Bertha to hasten forward, for by the time she entered the forest it had sunk down behind the tall trees, and it had become so dark, that the stout heart of the little maiden began to beat somewhat faster than usual, as she tried, with her bright eyes, to pierce through the gloom which was rapidly gathering in the dark vistas before her. "Was she in the right path?—perhaps not—and yet she felt almost sure—no, she had not seen that lightning-scathed tree in the morning—yet where could she have lost the path?—she would go back and try to find it."

But darker and darker the shades of night gathered around her, and, as she wandered on, now falling over the projecting roots of the trees, now feeling her way amongst their rugged stems, she only became further entangled in the thick and briery underwood. At length, wearied and faint, she sat down at the foot of a tree, and wept bitterly. She thought how her mother

would sit before the cottage-door, watching for her all the evening, and then how she would go in and prepare the evening meal, and the cheerful fire, to greet her darling on her return; and then she fancied her wandering forth into the forest to seek her, and losing her way, and dying of grief and fear.

Bertha knew not how long she had remained in this state. By degrees she became almost stupified with terror; the huge boughs of the trees assumed frightful and terrific shapes, as they seemed to bend towards her, and extend their giant arms, as if to enfold her within their ghastly embrace. The poor child pressed down her hands over her eyelids to shut out the hideous forms that haunted her. She tried to pray, but her thoughts wandered, and became more and more confused, and a deathlike torpor was gradually stealing over her. She was suddenly roused by a slight rustling sound, which appeared almost close to her; she looked up, but she could see nothing. Again the sound was repeated, and then she felt something gently touch her foot; she put forth her hand, and there she felt a small round substance; she took it up, and to her surprise perceived that it was a *filbert*. In a few moments another was laid at her feet, then another, and then a great many more. Bertha ate the nuts, for she was very hungry, and as she did so, her strength returned rapidly, and still more nuts were brought; and presently, as she put out her hand to take them, she felt a soft head thrust into it. "It must be the squirrel!" said Bertha,—"You dear little thing, how kind you are." Then the squirrel nestled close to her, just as if it understood what she said.

Just then, Bertha saw, at a short distance, a bright light shining like a star amongst the green grass. Gradually it approached nearer to her, and then she saw that it was a *glow-worm*, of wonderful size and brilliance. It came quite close to her and lay at her feet; the light it threw around was so bright that it illumined a space of several yards on every side, with a soft radiance like moonlight. "And are you come to help me, pretty glow-worm?" said Bertha. The glow-worm answered by approaching still nearer to her, and the little girl gathered a leaf, and laying the beautiful insect upon it, she held it in her hand. And now, the clear melodious note of a bird burst forth upon the still night air, and with a rushing sound the beautiful blue bird with the golden crest flew by, and alighted at Bertha's feet; then turning its head, and looking at her with its bright eye, and repeating its song, it hopped forward a little way, and then stood still, as if inviting her to follow. Bertha now arose, and fed by the squirrel, lighted by the glow-worm, and guided by the golden-crested bird, she proceeded on her way, full of thankfulness and joy.

After walking for about an hour, Bertha found herself at the termination of the forest, and a few steps more brought her to her mother's door.

When she entered, she found her mother nearly senseless from grief and terror, and some of her neighbours sat round her, trying to support her with hopes which they feared would never be realized; while others had gone forth in quest of the little wanderer.

The sight of her child soon restored Gertrude to life, and with tears of happiness and gratitude she pressed her darling to her bosom.

When Bertha was a little recovered from her fatigue she related all that had happened to her. "And where is the bird, my child?" said her mother. Bertha now, for the first time, looked round for her beautiful guide, but the golden-crested bird was gone. "But here is the glow-worm, mother; I have it safe in this leaf." Bertha opened the leaf, but instead of a glow-worm there lay something, bright and sparkling, but clear, and hard, and colourless, like glass. "Oh, where is my pretty glow-worm?" said the little girl, in a tone of disappointment, this is only a bit of glass,—yet how bright it is."

"Let me look at it," said an old man who was present, "I know more about those things than you do." He examined it carefully for a few moments, and then, he said, "*It is a Diamond.*"

The old man was right; it was a diamond, of marvellous size and brilliance; and when it was sold, it produced a large sum of money, sufficient to support Bertha and her mother all the rest of their lives in ease and comfort.

Bertha never forgot her walk through the forest; and many years after, when her grand-children used to prevail upon her to relate the story for their amusement round the Christmas hearth, she always ended her tale by saying, "*Never neglect an opportunity of doing good, even to the least of God's creatures.*"

M. A. H.

NUREMBERG.¹

THE fame of the painter of Nuremberg was not limited to his fatherland: his name was honoured wherever art was cultivated. In Italy, through which country he made an artist's tour, of which the records yet remain in his letters, he was received with the highest honours in every city; but the most interesting incident of this journey was his meeting with Raphael, his brother in genius. These two great men regarded each other with mutual admiration; and Dürer, on his return home, testified his esteem by sending to Raphael a portrait of himself, accompanied by a letter and several of his engravings—a compliment which was returned in kind by the Italian. To the lover of art there is something very gratifying in the idea of this intercourse between two such persons—each revered in his own land as the master genius of his profession, each imbued with the same noble imagination and vivid perception of the beautiful, though differing, in that each breathed the peculiar spirit of his own country. Their means and their opportunities too were very unequal; bred up under an Italian sky, surrounded by the beauties of Nature in their most luxuriant loveliness, by the numerous relics of all that was most perfect in ancient art, as by the rival glories of the modern school, Raphael enjoyed every advantage for which the poet and the painter might sigh, whilst Dürer, in the uncongenial clime of the north, had to struggle with the comparative inferiority of his models and the deficiency of his instruction; but, though he fully appreciated the greatness of his wants, he was far from being discouraged by them; his sojourn in Italy had taught him much, and he returned home to immortalize his name by still higher efforts. It is not only for his paintings that Dürer is celebrated; his genius excelled in every department of art; his engravings, of which great numbers are left to us, are wonderful both in design and execution; his sculpture is admirable, and he was most successful also in architecture, both civil and military, the fortifications of his native city having been formed, as is said, under his superintendence. Yet, universally as he was honoured, though kings and emperors loaded him with favours, though cities invited his visit, though at Antwerp he was escorted to his house by torchlight, after the fashion of the Roman consuls, he still retained the sweetness and unpretending simplicity of his nature. "He had," says his biographer, "the most agreeable manners, his converse was sprightly and good-humoured; he lived with the great without despising the little, and delighted in praising and encouraging his youthful brethren in art." After all, his mild and gentle disposition was his bane, for it caused him to die of a disease, which, with a different temperament, he would have been able to resist. This fatal affliction was a terminal wife. They say that the late Lord M., who was

(1) Continued from p. 233.

troubled in the same way, whenever he visited his native town in the north, was in the habit of dining with a plain old fellow, who had been his friend in boyish days. On one of these occasions the chancellor, talking over his successes in life, observed—"Well, throughout all I have had one single obstacle to contend with, one thorn in my side, and I never could get over it." "Ah, John," interrupted his matter-of-fact friend, "I'll tell you how to manage the thing: just tie the obstacle, as you call her, to the bed-post one morning, and give her as sound a hiding as we used to get ourselves at school." His lordship, who had not intended any reference to this peculiar obstacle, paused, looked foolish, and turned the conversation. Lawyers, however, are formed of tougher material than painters. The chancellor's constitution was not at all affected by his sufferings, but Dürer, who, even had he known of the sovereign recipe given above, would not have put it in practice, lingered for some time, and at length sank at the age of fifty-seven, a victim to his wife's incorrigible temper. His grave is still pointed out in the churchyard of St. John at Nuremberg.

Close beside Dürer's house stands the church of St. Sebaldus with its two tall and graceful steeples, its pointed gothic windows of beautifully painted glass, and its round hump-backed roof of red tiles. The inside is adorned with paintings and sculpture of the palmy days of Nuremberg, and presents a striking instance of the enlightened manner in which the reformation took place in this city. None of the ornaments which adorned it under the ancient regime have been removed or defaced; the church, though Lutheran in its worship, still retains all the semblance of a Roman Catholic temple, and even the lights, which were vowed to be kept perpetually burning over the tombs of particular families, are still there. In fact, the great religious reformation was attended with far less violence in Nuremberg than anywhere else. (One reason of this moderation no doubt was the superior intelligence of the burghers, which led them to the conclusion, that it was not necessary to destroy all that was beautiful in the old religion when they renounced its errors; but another cause is to be found in the early period at which the reformed doctrines were embraced. Nuremberg was amongst the first cities in Germany which declared in favour of Luther: the bitterness of religious contention had not then inflamed the passions, and blinded the understandings of its votaries; and even then, the way had long been prepared for the change, for even a century before, when Huss was on his road to Constance, there to suffer for the principles of the Reformation, his presence in Nuremberg was hailed with delight by its citizens and magistrates. The principal ornament of St. Sebald's church is the shrine of the saint, a splendid piece of bronze work by Peter Vischer, a celebrated sculptor who was contemporary with Albert Dürer. The design is that of a Gothic chapel in miniature, richly carved and fretted, which incloses the relics of the saint. The base is supported upon six enormous snails, and it is thronged with innumerable figures of the Apostles, the fathers, cupids, and so forth, all most admirably executed, especially the Apostles; at one end in a retired corner is a figure of Vischer himself in his working apron, with his tools in his hand. The artist complained that he was very badly paid for this masterpiece, and indeed, if there be any truth in the tradition, that he was employed on it with his five sons for thirteen years, a very considerable sum would have been requisite to indemnify him.

The great building behind this church is the town-house—a structure which, in size and magnificence, is quite worthy of the town to which it appertains. It is a large pile of massive stone, built round a large square court, not in the Gothic but the Italian style, and was in its day honoured by the visits of emperors. If you choose to enter, you will be shown some fine rooms, adorned with not particularly good pictures, and a re-

presentation in stucco, in one of the passages, of a tournament, which is very curious, as having been executed from the life, and would be well worth looking at, were it not that it is placed on the ceiling instead of the wall, so that in order to examine it, you are obliged to stand with your head bent backwards, in a posture which is liable to give one an unpleasant pain in the nape of the neck. Formerly, they used also to show the subterranean dungeons in which prisoners were confined, and the instruments of torture to which they were occasionally subjected, but the good town has got ashamed of these fine old relics of the olden time, and they are now sealed from the gaze of strangers.

The great market-place, which is near at hand, presents two most characteristic specimens of the Gothic mind in its grotesque and its beautiful aspects. The first is displayed in the church of St. Mary, a Catholic chapel, which looks the very quintessence of antiquity,—a small dingy edifice, more like a wrinkled, shrivelled old woman than anything else, with everything about it extremely plain, except the front entrance, which is by a triangular porch, rising to a point by steps at either side, the whole adorned with carvings and figures, of which it is difficult to say whether they are most remarkable for their quaintness or elegance. Beside it stands the *Schöne Brunnen* (Beautiful Fountain), justly so called, for it is one of the most beautiful specimens of Gothic architecture to be found in any country. It consists of a tall and slender spire, open on all sides, and carved in the most exquisite and fanciful manner, besides being adorned with small figures, also of admirable workmanship, representing the nine worthies, the seven electors of the empire, and various other personages. The Nurembergers have been particularly successful in their fountains; besides this, which is the gem of the whole, they have a very beautiful one, on the other side of the town, supported by female figures of great grace; another in the Town-house, surmounted by a boy in bronze most admirably executed, and several more in different places, all remarkable for their excellence. Behind the principal market, which is nothing more than a large open space, surrounded by plain wooden booths, is the goose market; goose meaning, I suppose, poultry in general, for I cannot suppose that the article of geese should be so important as to justify the allotting a special market to it alone. The peculiar nature of the traffic carried on there is pointed out by a small figure, which stands in the centre, representing a peasant with a goose under either arm. It is a capital statue in spirit and design. Nothing can exceed the admirable effect produced by the bandiness in the legs of the principal figure, and the expression of his face, which would seem to give him quite as good a title to the epithet of goose, as can be put forward by the birds which he carries. This is also a fountain, the water proceeding from the mouths of the two (feathered) geese, and is by the same artist, by name *Labenwolf*, who executed the boy in the Town-house. The chief object of attraction here is, however, the house of Hans Sachs, the cobbler poet. This hero is one of the trio of worthies, of whom the Nurembergers never can talk enough, the other two being Dürer and Vischer, and he is perhaps more characteristic of his age and his city than either of his brethren. His history is thus characteristic, as showing the good burghers of Nuremberg, and of the German cities in general, to have been so completely wrapped up in their own modes of living and thinking, as to have been unable to conceive that anything could succeed, which was not reduced to their own artificial standard, and enveloped in their own peculiar garb, so that even poetry was made a matter of burgher rule, as if it had been a craft, like that of the cooper or blacksmith. Poetry passed in Germany through a stage, to which in our country we have never had anything at all analogous. When the age of chivalry, properly so called, had passed away, and with it the inspiration of

the Minnesingers or Troubadours, who robed poetry in the garb of chivalry, it fell into the hands of the burghers. These excellent people at once constituted it a craft; and the guild of poets was enrolled amongst, and as regularly recognised as any other of, the mercantile brotherhoods, whilst the same forms and regulations applied to it as to the other guilds. The members were divided into apprentices and master poets, and the young aspirant, after serving his time of probation, as in other trades, usually travelled for some time in order to perfect his hand, and then having produced a piece which was considered to warrant his claim to admission, was solemnly inducted as a master workman. All this appears to us sufficiently strange, and the strangest part of the whole perhaps is, that these poetic mechanics should really have turned out what was worth reading. This, nevertheless, they achieved, and, of the whole of this strange race of bards, Hans Sachs, or, as his real name is said to have been, Loutzdorffer, was in his day, as he is still, the most renowned. He was by trade a shoemaker as well as a poet, knocking off his verses to the tune of the hammer with which he cobbled his soles, and from the immense number of his poetical effusions, would appear to have found the stringing a copy of verses no more difficult a matter than the making a pair of shoes. His productions were of all kinds, from the rude comedies and mysteries then in vogue, to drinking and love songs and satirical pasquinades. It was in his bacchanalian lyrics that he was most successful; inspired by his own mirthful genius, and by that good Nuremberg beer of which he was as fond as his great cotemporary Luther, he poured forth without effort that tide of grotesque song, teeming with quaint drolleries and burlesque morality, which has made his name dear to, and his songs sung by, the German toppers even of the present day. Hans, however, had a political object in many of his poems, the principal subjects for attack being the monks, whom he denounced most lustily for their idleness and love of the good things of this world; accusations which might be very well founded, but which did not come with the best possible grace from one so notoriously given to the same gratifications as our jovial cobbler.

Political and religious differences, however, sever all bonds of union, even those between boon companions; and Hans's poems were not without their effect on the great movement which was, during his life, convulsing Germany; so that, as the song of "Lilliburlero" is said to have rhymed the Stuarts out of their throne, the doggerel verses of the Nuremberg shoemaker gave no small assistance to Luther, and the biting satire of Sachs went a long way with many who would not have been affected by the most laboured argumentation of the more prominent reformers. Hans, however, was not always very discriminating in his attacks; his pasquinades occasionally got him into scrapes; and one of them, whether or not it be historically true in all its details, is the foundation of rather a good story, which may one day be presented to the readers of *Sharpe's Magazine*.

I think the title which I have given Nuremberg, of the Gothic Venice, is that which best describes its character. It has been called the Pompeii of the Middle Ages, but it has the advantage over Pompeii, of being a still living city; and again it has been styled the Gothic Athens, but the sober, business-like temperament of the town and its inhabitants scarcely support the claim to such an appellation. It is not only in the character of its citizens, which combined the attributes of the haughty noble with those of the enterprising trader, and the munificent patron of art with the plodding merchant, that this analogy is observable, but even in many respects in the outward features of the town. It is most strikingly exemplified in those streets which border upon the Pegnitz: the river flows deep, smooth, and waveless, more like a canal than a living stream, and the houses rise up direct from its margin,

the basement story washed by the placid water. These houses, indeed, are not marble palaces, rich in all the graces of Italian architecture, but their tall, massive walls, high and pointed roofs, gloomy windows and heavy galleries overhanging the water, have an air of stern and imposing strength, which better betokens the character of the scene. Indeed, I do not know that an artist could anywhere get a more striking street view than is to be seen from some of the bridges which span the Pegnitz; (one of them is built in imitation of the Rialto, and a very good imitation it is, too;) the antique appearance of the houses, most of them many centuries of age, eked out with apartments built on wooden projections, which overhang the river, and apparently dropping to pieces with rotteness—the perfect quiet of the whole, save when a boat pushes from the water-gate of one of the houses and glides silently across the stream,—all this forms no ordinary study. It is, however, only on the river that this appearance of solitude prevails—everywhere else the city is remarkable for its gay and cheerful aspect: the wide and nicely kept streets have an airy and open look which is quite delightful, and this pleasurable feeling is enhanced by the fanciful decorations of the houses, and the bright colours of the blinds in the oriel windows, from behind which a merry face often peeps forth; the ways are thronged with busy passengers, whilst every now and then a loud laugh resounds from one of the numerous beer-shops to be found in each street.

Talking of beer, we may as well step in and have a glass, for this trudging through streets is dry work, and the beer of Nuremberg is excellent, very different to the wishy-washy stuff which the students of Bonn and Heidelberg delight in. The beer-shop you see, is a sort of cellar, but very cool and pleasant in this hot weather. It bears rather a curious name, being styled the "Jacob's Ladder:" the Nurembergers are very much given to these odd titles, for there is another beer-shop called the "Valley of Tribulation," besides many others, the appellations of which smack of the puritan rather than the publican. Cellar though this is, however, everything is extremely neat and tidy. The beer is brought, brisk and sparkling, in bright clean glasses; and nothing can be more faultless of dust and stain than the tables and benches, coarse wooden things though they are. Indeed, this characteristic of cleanliness appears to me a distinguishing peculiarity of Nuremberg, as compared with other German towns of an old date. From what cause this arises I cannot pretend to say, unless, indeed, it be the absence of Jews; for I have observed that the amount of filth invariably maintains an exact ratio to the number of Israelites in a town. Now in Nuremberg there are no Jews: there were a great many in former times, but the honest burghers found that the Hebrews were a great deal too sharp for them, and were monopolizing all the trade; so the whole colony were expelled, not exactly with a fork, as the Latin poet has it, but with a very significant hint that they had better not come back again. Whether they took their dirt with them I cannot say, but they would appear to have left none behind.

The great sight on this side of the town is the church of St. Lawrence, which surpasses even that of St. Sebaldus in grandeur of design and beauty of decoration. The principal entrance is adorned with carving in stone, of a luxuriance and elegance which I have seldom seen equalled, and the interior is quite as remarkable. lofty and spacious as is the rival church of St. Sebaldus, this is still more so, and the noble effect of the whole is enhanced by the height and gorgeous painting of the Gothic windows. As a set-off to the shrine of Peter Vischer, there is here the masterpiece of Adam Kraft, a sculptor almost equally prized by the enthusiastic Nurembergers. It is called the Sakraments Hauslein, the repository for the sacramental wafer, but is so only in name, being in reality an open Gothic shrine of exquisitely elaborate workmanship, supported on three

kneeling figures of Kraft and his two apprentices, the whole being between sixty and seventy feet in height. The entire work is of carved stone; but so delicate is the tracery, and so bold and unrestrained the main design, that it was not till the test had actually been applied, that it was believed not to be merely of plaster moulded; and even yet, looking at the light and airy elegance of this really ponderous structure, one can scarcely conceive that it should ever have been created from such stubborn material. Whether regarded as a work of art, or a mere triumph of mechanical skill, it arouses one's warmest admiration.

(To be continued.)

COUNTRY SKETCHES.

No. II.

A SUMMER'S MORNING AT HEVER.

THE scenery is very beautiful in the neighbourhood of Hever: probably no part of Kent is more richly wooded or less populated. It matters not whether the ride or walk to it is taken from the stations at Edenbridge or Penshurst, both are equally interesting.

From the village of Penshurst the road lies through a long series of lanes, where the hedges are thickly studded with oaks and beeches, whose branches mingle as they meet; yet afford views, on either side, of a country very highly cultivated. Hop grounds, or "gardens," as they are called, are interspersed with corn-fields, and add greatly to the picturesque beauty of the scene. Then there is the village of Chiddingstone, or Chidingstone, with its old-fashioned homesteads, and a group of houses opposite the church, that bear a very old date. They are constructed in the usual solid manner of the old times; and wear still a substantial appearance. Huge masses of timber, quaint carved work, and gable ends, make up an *ensemble* worth stopping for a half-hour's rest to admire. Gossips, too, will point out the stone where the admonitions were bestowed in days gone by, which gave a name to the place. Near, and progressing to the journey's end, there is a pretty wood and some rock to pass through, and a modern castle to leave to the left, which tend very agreeably to diversify the way.

The same kind of farm houses, cottages with black timbers, and gable ends, are to be seen at Hever. It is a very quiet, secluded, out-of-the-world spot; where change with her magical wand seems to have never been. All things wear an old look. It is said on proper statistical authority that the population has decreased within the last twenty years; a fact which, if the present aspect of the place may be taken as a criterion, cannot be doubted. There are no new buildings to be seen anywhere; all is as it might have been years ago.

The village is situate on the brow of a hill, on the summit of which, Henry VIII. is said to have been in the habit of sounding his bugle-horn when he came a-wooing to the fair Mistress Anne. Gallants of that time were wont so to announce their arrival to the lady of their love. Some chroniclers assign to the act a more precautionary meaning, and assert that it was done in order to procure assistance, in consequence of the bad state of the roads.

A very humble hostelry now stands there, whose sign-board is decorated with a portrait of the bluff king. Many a long year has it swung to wind and gale, and bears the sad testimony of its age by rack and rent. Nearly opposite is the church, with taper spire. It is a plain country-looking house of prayer, but has within it some fine monumental brasses. Within the porch,

and under the belfry, is the oldest; it is an inscription to the memory of one of the Cobham family.

On the floor of the body of the church is a full-length female figure, with armorial bearings, and the feet resting on a dog. It has a small tablet to state that it was placed to record the existence of one Margaret Cheyne, a connexion of the Bullen or Boleyn family.

In a recess on the wall near the altar is the figure of a man kneeling: this was the tutor of the Waldegraves. But the gem of all is a recumbent effigy on an altar tomb. This is one of the finest brasses of its era. It represents Sir Thomas Boleyn, in his robes as a Knight of the Garter. It is as large as life, and has the following inscription fixed above the head; the legend is singularly reversed:—

"Here lieth Sir Thomas Bullen,
Knight of the Order of the Garter,
Earl of Wilscher and Erie of Ormonde,
Which deceased the 12 daie of Marche,
In the yere of our Lord 1538."

The costume, heraldic insignia, and general characteristics of the period are most faithfully depicted; and the brass is altogether a most vivid representation of the high personage in honour of whom it was engraved. By means of common heel-ball, and a roll of paper, kept purposely on sale at a neighbouring cottage, a very good impression may be taken. It will be the work though of two, if not three hours, and as that would consume too much of the time of even a summer morning's visit, the visitor is recommended to make a bargain with the clerk, who will let him have one or more impressions of this and the other brasses at a very reasonable rate.

There is a stone close by this tomb, which testifies, by the indentations on it, to have once held a brass cross. Such is the case. It was taken from hence, and laid down in the chancel of the church at Penshurst; why or wherefore is not recorded. The cross is there, about a foot and a half in height, and has this inscription at its base:—

"Thomas Bullayen the sone
Of Sir Thomas Bullayen."

This is an interesting memorial, inasmuch as Sir Harris Nicolas states in his work on the Peerage, that this same Sir Thomas had but one son, George Boleyn, who was attainted and beheaded *vitæ patriæ*. The probability is that this was really and truly a monument to a brother of Anne Boleyn's, consequently son of Sir Thomas; and that he died young. It was often customary to erect on the tombs of the early departed, some religious emblem.

It is time, however, to quit these wanderings among the tombs, and inspect the castle, which stands a very short distance from the church.

It is situate somewhat in a hollow, and is surrounded by a moat formed of the river Eden, a small branch of the Medway. It is in excellent preservation, and affords an admirable specimen of the architecture of the time. It was formerly a manor-house, belonging to William de Hevre, and was embattled by him in the reign of Edward III. It consists of a central keep with two square towers on either side, a quadrangular house with a court paved with red bricks, very fantastically arranged. The keep is pierced with a gate of enormous strength, and three portcullises with doors studded with stout pieces of iron, nails, &c., attest the great pains that were taken to render the place impregnable in case of a siege, or sudden assault. One of these doors is still in a most complete state of order and preservation, and retains its original bolts, latch, &c. On the exterior front of the keep, and over the outer gate, are several machicolations and some elegant stone tracery. Some outbuildings now used as granaries and farm-stores are evidently remains of offices appertaining to the castle. The present entrance to the edifice is through the old dining-hall, now tenanted by a farmer,

and used by him as a kitchen. There are tables, safes, &c. said to have formed part of the original furniture of the Boleyn family. The tables are very long, and of somewhat more massive construction than those of the present day. They were possibly intended for the baron, and those whose privilege it was to sit above the salt; for smaller tables placed crosswise were the proper place of the humble retainers.

The hall is parted from the entrance door by a screen of old oak.

Adjoining this apartment is the staircase; on the walls are many pictures, of most indifferent execution. The visitor will be startled in his recollections of *Rapin and Hume*, if the same amount of historical information is accorded to him as fell to the lot of the writer, who was gravely assured by the attendant cicerone, that a portrait of Edward VI. was Queen Anne Boleyn's son's likeness; and that a veritable resemblance of Garrick as Richard III. was that Protector-man Oliver Cromwell. There are many rooms and sleeping chambers on this first floor.

One of them is shown as the bed-chamber of the unfortunate queen; it is panelled, and contains a bed with old damask hangings; this is, of course, said to be the couch of poor Anne. There are several chairs, tables, trunks, all of which certainly look antique enough to pass muster as having been used by her. In a corner of the room is a dark closet, the window of which is closed up; there is also a small trap, fastened down.

It is rumoured that Sir Thomas Boleyn confined his daughter in this dismal looking place, when the king paid Hever a visit, as he did not wish his amorous majesty to see her; and, by means of this trap, victuals were conveyed to her from the outside. This is one of those old-time tales, which seem to cling to the walls of castles and strong-holds that are famous in story. What is a castle without its legend?—a mere crest without a motto. The top of the building is occupied by a gallery more than a hundred feet long; it has a curiously vaulted roof, is panelled with oak, and the flooring, which is laid down in a very rude manner, is formed of the same species of timber. There are many recesses here, and in one of them a flight of steps, with rough elbowed benches, for the lord of the domain to use on occasions of state. At the end opposite is a trap-door, leading to a chamber, in which fugitives sought a temporary retreat. This is, in all probability, another of the traditions belonging as part and parcel to Hever.

In one of the lower windows of a room on the hall-floor, the family arms of the Bullens appear in stained glass.

After crossing the court-yard, the keep is entered by a winding staircase in one of the towers. There is a small ante-room, which leads from these stairs into the great state hall. This has been restored within the last few years. It is panelled in handsomely carved mahogany, and contains many family portraits; there are none of any interest, save one of no particular merit,—a likeness of Anne Boleyn. A music gallery and a library are attached to this room. In the former are some screens of needlework, of a most venerable and faded aspect.

The hall is decorated with some armorial bearings, whose only fault consists in their looking too clean and new; time will remedy this defect. There is egress from the turret stairs on to the leads of the tower; the view is not of an extensive nature; everywhere a fruitful smiling country. There are no habitations to be seen, and but one symptom of man's vicinity; that one, though, is a formidable evidence of his existence. Between a belt of umbrageous elms, a column of smoke may be seen running, so to speak, past at a miraculous pace. This is the line of the Dover railway. What a contrast!—the past! and the present! Here the strong-hold of a feudal baron, one of those castles of security that an improved and improving state of society has

rendered obsolete. There the steam-engine, a machine with appliances and powers which defy both time and distance.

The album that is kept in a parlour in one of the inhabited rooms, boasts amongst the list of its visitors whose names are recorded, the autograph of her most gracious majesty Queen Victoria, who, with the *Duchess* of Kent and suite, rode over from Tunbridge Wells on the 13th of September, 1834, and minutely inspected the residence of two former queens of England.

The manor and castle of Hever were purchased from the Cobhams of Kent, in the year 1458, by Geoffrey Boleyn, who was at that time lord mayor of London. About the same time he bought Blickling-hall and manor, in Norfolk, from Sir John Fastolf. Both Blickling and Hever have contended for the honour of having been the birth-place of the fair Anne, but the general opinions, founded on various authenticated facts, appear to concur in favour of Blickling. Certainly it is, that upon the death of her mother, Anne resided and was educated at Hever. Letters are still extant, dated from thence, and addressed to her father at court. When the love-match between her and Percy was broken off, she retired to Hever, having left it some few years before to become maid of honour to the queen Katharine, whom she had the great misfortune to supplant in the affections of the king.

It was at Hever where Henry renewed the acquaintance with his lovely subject. It was at Hever where she rejected his proffered admiration, and it was from Hever she departed to a court where she met with her tragical and undeserved end. It is a curious circumstance, and one which may be reckoned as a mystery of history, that her birth-place, the church where she was married, and her last earthly resting abode, are all matters of doubt.

Sopewell nunnery in Hertfordshire, Dover, Blickling hall, and Whitehall, are mentioned by historians, as the spot where she became a wife and a queen. Again, Salle church in Norfolk, Thornden-on-the-hill in Essex, and the Tower church, claim to be the sacred repository of her remains.

There are two rival traditions, which affirm that her body was secretly conveyed from the Tower to Salle on the one hand, or to Thornden on the other. Her residence at Hever, and the king's visits to her whilst there, are beyond all doubt, and give to the old castle a veritable interest. On the death of Sir Thomas Boleyn, Hever and its appurtenances were seized by Henry, and became crown property. When the ruthless monarch was determined to divorce himself from his fourth wife, Anne of Cleves, it was Hever he selected as her residence, amongst many others. Accordingly we find that ill-used and repudiated lady writing to her step-daughter Queen Mary, in the year 1554.

"From my poor house at Hever, the 4th of August.

Your Highness' to command,

Anne the daughter of Cleves."

In sweet and calm retirement, in the small cares and occupations of domestic life, she passed her pleasant days, alternating her residence at Hever, with Blickling and Penshurst.

She died at Chelsea, in the middle of the month of July, 1557, and her death was as tranquil and patient as her blameless life had been. What a forcible contrast to the first Anne! Her excellent sound sense, and the happy tenour of her disposition, found at Hever a congenial home, whilst the restless nature and offended dignity of Anne Boleyn, aided by unfortunate circumstances, induced her to quit its peaceful shades, for a city where she met with a fate whose horrors cannot be dwelt upon here. The Waldo family are the present possessors of this property, and kindly allow every possible facility to tourists and historiographers, who wish to examine and explore the castle. It is to be hoped that the rage of the day for modern improvements will not find its way to this village, and destroy so interesting a

relic of the past. Associated as it is, and ever must be, with the histories of two of the queens of England, it will be ever worthy a visit. The charming scenery, too, which surrounds it on all sides, renders it doubly attractive.

The meanderings of the little Eden, with its mossy banks, the magnificent oaks, and the fertile appearance of the fields and pastures, combine to form landscapes of the most sylvan and gentle character, so that the first glance of the castle is quite startling. This gives additional effect to it, and helps the imagination to invest it with charms, that are the fitting inheritance of localities such as Hever.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE OLD CLERK'S VANITY.

W. BRAILSFORD.

"AMEN," said the clerk, as he closed his book,

With a heavy sigh and groan,

"In Nature's sweet pages I'll try to look

For feelings like my own.

The mavis sings to his young on the bough,

The linnet to its gentle mate I trow,

But I seem all alone.

"Ah! dear my child, in the merry greenwood

Thy form was fair to see;

Full many a prayer in its solitude

Have I offered up for thee.

Full many a prayer, for thou wert so young,

Such a halo of beauty o'er thee hung—

Yet, 'tis all—all vanity!

"My life seems parted from all gentle things,

No joys to me will come,

The thought that ever to my old heart clings,

Is my lone vacant home.

It is as though all kindly natures fled

With the dim shadow of that lovely dead—

So wearily I roam.

"Sweet music have these aged oaks, sweet lays

Are filling earth and air;

Sweet meetings in these pleasant leafy ways,

Sweet thoughts for love to share.

Ah! all too beautiful, ye flowers that seem

As mocking to my sense as some new dream

That wakes me to my care.

"Unclasp, old book, I may not see those trees;

I may not list again

The rich-toned melodies that swell the breeze,

For aye it gives me pain.

Still, all is vanity, the Frenchier saith,

Even that gentle life, that saint-like death,—

The grave where she is laid."

TO —, ON READING SOME OF HER FORMER LETTERS.

BY GRACE.

'Tis not with vain regret I view

These records of our earlier time,—

Unfading violets, with the dew

Still on them, as in morning's prime.

In morning's prime, when future fate

Without its darker shades appeared;

When anger, jealousy, and hate,

Were names we rather shunned than feared.

When all that to our eyes seemed bright

We loved, and never questioned why;

And the quick current of delight

In glad transparency flowed by.

If aught be in those memories fair,
Aught that 'tis well we should recall,
When saddened by some present care,
These cherished records hold it all!

They hold it all,—I read, and swift
As light, my heart with peace is filled;
I read, and feel that Heaven's rich gift,
Our early love, has ne'er been chilled.
Dear! let us to ourselves be true,
That, as we thread life's winding maze,
No bitterness may cloud our view
Of those beloved and happy days!

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

It is the prerogative of genius to confer a measure of itself upon inferior intelligences. In reading the works of Milton, Bacon, and Newton, thoughts greater than the growth of our own minds are transplanted into them; and feelings more profound, sublime, or comprehensive, are insinuated amidst our ordinary train; while, in the cloquence with which they are clothed, we learn a new language, worthy of the new ideas created in us.... By habitual communion with superior spirits, we not only are enabled to think their thoughts, speak their dialect, feel their emotions, but our own thoughts are refined, our scanty language is enriched, our common feelings are elevated; and though we may never attain their standard, yet by keeping company with them, we shall rise above our own; as trees growing in the society of a forest are said to draw each other up into shapely and stately proportion, while field and hedge-row stragglers, exposed to all weathers, never reach their full stature, luxuriance, or beauty.—*James Montgomery*.

CLEVERNESS is like good nature, a point always brought forward when there are others which it is desirable to keep in the back ground.—*Margaret Percival*.

I HAVE observed one ingredient, somewhat necessary in a man's composition towards happiness, which people of feeling would do well to acquire; a certain respect for the follies of mankind; for there are so many fools whom the opinion of the world entitles to regard, whom accident has placed in heights of which they are unworthy, that he who cannot restrain his contempt or indignation at the sight, will be too often quarrelling with the disposal of things to relish that share which is allotted to himself.—*Mackenzie's Man of Feeling*.

THE time for reasoning is before we have approached near enough to the forbidden fruit to look at it and admire.—*Margaret Percival*.

HE who is catching opportunities because they seldom occur, would suffer those to pass by unregarded, which he expects hourly to return.—*Johnson*.

VOL. IV.

THE LIAGH FAIL, OR CORONATION STONE.

"Hail to the crown by Freedom shap'd—to gird
An English sovereign's brow! and to the throne
Whereon she sits! Whose deep foundations lie
In veneration, and the people's love,
Whose steps are equity, whose seat is law."

We suppose that the greater part, if not all, of our readers have visited Westminster Abbey,—that place dedicated to the great, the good, and the gifted, among England's children;—we suppose they have felt the power and strength of human intellect while gazing on the bust of Newton, and called to mind the cutting moral irony of him who asked his country for bread, and received a stone.

We tear ourselves away from this holy spot; and, after admiring that most elegant of female statues, Lady Walpole, and giving a sigh to the memory of the young and royal exile of Twickenham, our attention is requested to an antique, and somewhat clumsy, oaken chair, which our guide, in a tone of mock-heroic dignity, informs us is that in which "all the kings and queens of England have been crowned." He then points to a large misshapen stone under the seat of the chair, and almost hidden by thick old ornaments, acquainting us with the fact that, wherever that stone forms part of the coronation ceremonial, there one of the true race shall reign. We will not question this at present, but assure our readers that the history of this stone, of its adventures and journeyings, is by no means uninteresting, especially to such as love to dive into the dark waters of antiquarian lore.

Toland, in his *History of the Druids*, calls this Liagh Fail, or Stone of Destiny; "the ancientest respected monument in the world; for, though some others may be more ancient as to duration, yet thus superstitiously regarded they are not." The stone is, therefore, an object of no ordinary interest.

When Edward I. wasted life and treasure in vainly endeavouring to conquer the Scottish nation, (for the country he overran, the houses he destroyed, but the people he could not subdue,) he found in the ancient palace of Scone a chair, in which was embedded a sacred block of stone, to which tradition ascribed marvellous virtues. According to Wintown's Chronicle, the Scotch shall reign wherever that stone stands; but the more ancient legend asserts that the stone has the virtue of discerning a prince "of the true line" from a usurper; and that it gives notice of this by a particular sound. Here is a contradiction at once; as the usurper having been crowned, the mere presence of the stone makes him of the true line, although, perhaps, his legitimate right may not be traceable. However, the same subtlety which dictated Edward's conduct towards the Welsh induced him to remove the Liagh Fail to London; perhaps in the hope of thereby acquiring some power over the minds of the Scotch, perhaps in the expectation of renovating the ardour of his almost wearied soldiers. Thus was the Stone of Destiny brought to London, and placed at the shrine of Edward the Confessor. Its miraculous virtues we must suppose to have been left in Scotland, or surely they would have displayed themselves during the disastrous contests of York and Lancaster; by its aid how many disputed points might have been cleared up to

posterity! but we have no record in history that it added its groans to the stings which must have assailed Richard III., whether he were a murderer of children or not; nor have we ever read that it lent a sigh to the foreboding pangs of Lady Jane Grey. In the worthy House of Stuart it would, of course, acknowledge the "true line;" although, at the period of its removal from Scotland, the founder of that unhappy family had not yet deserted his original occupation for the less peaceful task of governing an unruly people. But was it fear of inharmonious music from the stone which led Cromwell to refuse the proffered crown? After the danger of such an indignity, how must the Liagh Fail have exulted in the coronation of Charles II.! But what was its behaviour at the Revolution of 1688? We must suppose either that it had left its faculty of distinguishing right from wrong at its old abode of Scone, or that its virtues had worn out,—virtues do wear out, sometimes; that is, we take so much credit for what we have done, that we think it needless to do more. How exquisitely absurd is the whole story!

We have brought the Stone of Destiny to London, and introduced its present form and office; let us now look back to its earlier history. Shall we alarm our readers if we refer to the traditions of Ireland, going back far, very far, beyond the period of accredited facts, into the darkness, or, as the Irish would say, the brightness of the earliest ages after the deluge? Hollinshed, following these legends, says, that Gathelus, the son of Cecrops, brought the Liagh Fail to Egypt, thence to Spain, where he "sat upon his marble stone in Brigantia," now Compostella. He then passed over to Ireland, bringing the stone with him. Another tradition is, that it was brought by giants from Africa, which touches thus nearly upon modern fact. Some years since, a piece of stone from Stonehenge, highly polished, was shown to an eminent geologist, and he was asked whence he imagined it came: he replied that it looked like African stone, but that, if it were British, it came from Anglesey: the bit of stone was presented to the Geological Society. Other traditions attribute the arrival of our stone to the sea-kings, or to the Phœnicians, who had settlements in the southern part of Ireland: each of these tales becomes probable when we remember that many colonies settled in that country, distinct in their characters, approaching to each other in their religious observances, and almost identical in language. We do not except the African giants in this, as we know that the northern coast of that continent was inhabited by a race proceeding from a very different stock to the Egyptians; and that the habits and customs of the Berbers show them to be of Celtic origin, nearly related to our Cornishmen. Might not the band who recorded on the pillar at Tangier, "We flee from Joshua the robber," have been those African giants, who, driven out of Palestine, fled to their brethren, the "people great, and many, and tall," of the Scriptures! If, pressing westward, as population has always done, these outcasts reached the Sacred Isle of the West, their previous customs would lead them to erect a stone as a memorial of their deliverance. Thus do we read this apparently absurd legend.

As to Hollinshed's derivation of the Liagh Fail, we are scarcely intimate enough with the family of Cecrops to decide upon its truth, but we have evidence that Spain and Ireland had some connexion in early times; we see the foot-steps of the Druids among the recesses of the mountains of Estremadura,—this word carries us very far eastward,—and we find an important remnant of Celtic population in the Basque provinces.

Mr. Moore, quoting the Book of Hoath, says, that the Stone of Destiny was brought to Ireland by the "Tuath-de-Danaans, a colony of people famed for necromancy, which they had learned in Greece." This name is suggestive, and we should rather say that they taught necromancy to the Greeks, as that people had

not yet perfected the arts which they borrowed from Egypt; and on other grounds we must hesitate as to the probability of truth in Mr. Moore's quotation. Buchanan says, that Simon Brech, a Scythian, brought the stone to Ireland, "amongst other princelike jewels and regall monuments;" and that he was crowned upon it, 700 B. C. In all these tales, one thing is certain, that all traditions, however differing from each other in minor points, agree in mentioning the Liagh Fail as a foreign importation; and this is a matter of some importance. Upon the whole, we imagine that it might be either an altar-stone or sacred pillar belonging to one of the many Druidical temples, whose remains are still visible in Ireland; and, consequently, cotemporary with the first influx of Celts, or whatever else we may call them, who left their common home after the Deluge, spreading over the world in compliance with the divine injunction to replenish the earth. Writers upon this subject have divided the bulk of mankind into three grand streams; one proceeding southwards towards Hindostan, where we trace them by their cromlechs, pallas, and rock-worship, and still more by their astronomical terms; another stream proceeding westward to Phœnicia, where we again, independently of the sacred writings, trace the use of stone memorials; and a third stream to the north-west, from which proceeded the Goths, Scandinavians, Huns, and all the barbarous tribes which anciently troubled Europe.

Man is sadly prone to make to himself visible objects of adoration; and the most obvious substances for this purpose were rocks and stones, which were, from the very earliest period, used as memorials both in religious and civil matters: hence they came to be regarded with religious reverence, and gradually to be worshipped. Perhaps, also, the sacred character of rocks and stones arose from their apparent immutability, which rendered them fit objects for the reliance of man. Trees may change or be destroyed, but a rock remains the same through many generations; and the mind which caught but few and confused glimpses of a future world, was but too much inclined to worship the unchiselled block, or the rude cairn which covered the object of its affection; that affection was felt to be eternal, not to be changed by death or time,—how then could it be more fitly commemorated than by the indestructible pillars of the earth? The Liagh Fail may have fulfilled a two-fold purpose; it may have been an altar of adoration, as well as a place of inauguration for the monarch, who, in those early times, was both priest and king.

"In ancient times, when from the west

The star of science sent its ray

To illuminate Erin's sacred isle,

And change her darkness into day,—

Then from the stone the priest-king taught

The assembled multitudes to bow

Before that glorious orb, from whom

The blessings of existence flow.

But yet no idol was there framed,

No knee was bent to wood or stone;

They worshipped, by his glorious type,

The One Invisible, alone.

Soon darkness clouds the scene, a barbarous band

Expel the sons of peace, and subjugate the land;

Beneath the Scythian yoke what monsters rise

To claim the sacred rites of deities!"

The Scythian tribe here mentioned conquered the earlier inhabitants of Ireland, drove some of them into Scotland—hence the name of that country—but retained a part of the priests as the teachers of youth; many sought their brethren the Culdees of Iona, and how far northward they voyaged, the stones of Stennis witness to us. The Tuath-de-Danaans had worshipped the sun and planets, the earliest and purest form of idolatry, the religion of Nimrod and Zoroaster; the Scythians or Scots professed Druidism in its corrupted shape, with its attendant jugglery and cruel sacrifices; and, from this time, Ireland seems to have been retained

under the same debasing yoke. The island became the stronghold of the Druidical religion, and most wonderful are the existing remains of it; indeed it appears to be one of the characteristics of Druidism, that its remembrance shall never be lost to the world. The Parthenon is a ruin,—the Cromlech remains entire. We may imagine, that, under the Scythians, inauguration at the sacred stone was still necessary to render valid the election of the monarch; in all cases of conquest it is the policy of the victor to respect the religious prejudices of the conquered; and mistakes are frequent, in which the customs of the vanquished have, in a short time, become those of the victors. The ceremony of inauguration at the Liagh Fail is by some writers referred to the Scythic colony, which is called the Milesian, from Milesius, king of Spain, whose two sons, Heber and Heremon, (names equally suspicious with our Hengist and Horsa,) were the conductors of the expedition. Heremon became the founder of a long line of monarchs, who have been enthusiastically chanted by the bards, but are dimly shadowed out in history.

Although coming directly from Spain, the bards described this colony, and rightly, as sprung from Phœnician ancestors; they led them into Egypt and Spain, and finally to Ireland, 1300 B. C. In naming Egypt they probably confounded the Scythians with the Tuath-de-Danaans. There is reason to think that Ireland was peopled very soon after the deluge; the number of letters in the alphabet, and the sacred or Agham character, show this probability; the latter so much resembling the Persopolitan inscriptions as to suggest a translation by means of the Irish language, which, with the fact that the shamrock was anciently held sacred to the decoration of altars in Persia, its only natural home, may lead to the supposition that the Irish derived their learning, and perhaps their parentage, from Persia rather than Phœnicia. After Heber and Heremon a thick mist hangs over Ireland; the Simon Brech whom we have mentioned might be one of their descendants, but we find few lights amid the gloom. One of these is the "Royal sage Ollamh Fodhla," who instituted a school of general instruction at Tara; and another is "Con of the hundred fights," celebrated by Ossian. From the family of this hero was descended that race of chieftains, the Dalriads, a demi-tribe of Ulster, who supplied Albany, the modern Scotland, with her first Scottish rulers; Carbre Riada, the grandson of Con of the hundred fights, being the chief who, about the middle of the third century, established that Irish settlement in Argyleshire, which, taking the name of its princely founder, grew up in the course of time to the kingdom of Dalriada, and finally became the kingdom of all Scotland. From the decline of Druidism we hear no more of our Stone of Destiny till the time of Carbre Riada, who is said to have carried it with him to Scotland, and this is countenanced by the fact that a "stone of great import and notoriety" was kept in Dunstaffnage Castle, Argyleshire, where it was much venerated by the people, as late as the ninth century. Buchanan, however, attributes the removal from Ireland to Fergus the son of Erek, who, aided by the Nial family, headed a strong reinforcement to the Dalriadic colony, extending the limits of the former settlement, and giving it sufficient stability to throw off its dependence upon Ireland. From Fergus was descended Kenneth M'Alpin, king of the Scots, whom, according to the well known lines of Cowper, we must designate a hero; his slaughter of the Picts being most unmerciful, amounting almost to extirpation. Some old Scotch verses may be thus translated:—

"When Alpin this king was dead,
He left a son, was named Kyned;
Doughty man he was, and stout,
All the Picts he put out,
Great battles then did he,
To put in freedom his country."

These lines are more true than poetical; henceforth the Scots ruled the hitherto divided kingdom, and Kenneth removed the Liagh Fail from Dunstaffnage Castle, the regal abode of the Scots, transferring the seat of royalty and the sacred stone to Scone, and causing the latter to be enclosed in a chair of wood. After a reign not only of military activity but of civil usefulness, Kenneth died at Fortriot, and was buried at Iona. Holinshed's expression is that Kenneth placed the stone at "Scone, upon a raised plot of ground there, because that the last battle which he had with the Picts was fought near unto the same place." This seems to infer that the stone was placed in the open air. Is this a remnant of the ancient custom of administering justice under the canopy of heaven alone, of which we read in the Bible, and find traces in the graduated mounts of the Druidical hierarchy?

All the Scottish kings till Robert Bruce were crowned at Scone, and Edward I. caused the removal of the stone in 1286. By the treaty of Northampton, 1328, it was agreed that the Liagh Fail should be returned to Scotland, and for this end writs were issued by Edward III., which, however, were never executed.

Such is the romantic tale of our coronation stone. The chair in which it is fixed is very ancient, but it is covered with rich draperies at a coronation, and the antique carving is not seen. What will be said if we declare all this history to be a fiction, authorized by the credulity of ages, and now unveiled by the scientific inquiries of an Irish antiquarian? Suppose Kenneth M'Alpin merely picked up a stone of memorial in Argyleshire, which our Edward eagerly removed to London, and offered at the shrine of the Confessor, either under the supposition that it was the true one, or, not caring much about that, hoping by its means to work upon the credulity of the Scots? Suppose the real Liagh Fail of the Tuath-de-dananns was of a different form to our coronation stone, and that it were still in Ireland?

This has been alleged as a fact by Mr. Petrie, in an elaborate essay on the antiquities at Tara, read before the Irish Academy a few years since. This able antiquary quotes a tract written in the twelfth century, being a description of Tara, evidently by a person who had seen and examined the remains which he describes. In this tract the Stone of Destiny is mentioned as an "obelical pillar stone" then at Tara. It is said now to be standing as a memorial of the interment of a large number of the insurgents who fell there in 1798.

"To what vile uses may we come at last."

The royal Tara is now an assemblage of irregular hillocks, and the sacred stone of kingly inauguration marks the grave of rebels! This pillar is of granular limestone, about four feet in circumference, standing six feet above the ground, and sunk as much beneath it. It certainly appears more probable that the Liagh Fail was an obelical stone than a mere mis-shapen lump like that exhibited in Westminster Abbey to admiring strangers, unless indeed its exertions and sufferings in the cause of royal legitimacy have worn it to its present form. But whether we allow its Irish extraction or not, our coronation stone is an interesting object on account of the part it has taken in so many ceremonials; and, when we think that all the Scottish monarchs, till Robert Bruce, swore to maintain the rights of their people by touching this stone, and when we remember the brave king who brought it to England, we may be excused if we give way to our romantic feelings, and forget for a brief time the less honourable memorial of the hill of Tara.

Of this hill we could say much; it has been a subject of investigation to the learned and exploring, but it is still shrouded in uncertainty. We venture to suspect that any attempt to connect it with the Round Towers will fail, and we are much disposed to agree with Mr. Petrie's observations respecting it, though we by no

means agree with him as to the comparatively modern origin of the Round Towers.

"Men are we, and must grieve when ev'n the shade
Of that which once was great hath passed away."

F.C.B.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

CHAPTER X.

FACING THE ENEMY.

"Is your master—is Mr. Vernon at home?" inquired I of the grim-visaged old servant, who looked, if possible, taller and more wooden than when I had last seen him.

"Well, I suppose not, Sir!" was the somewhat odd reply.

"You suppose!" repeated I; "if you have any doubt, had you not better go and see?"

"That won't be of no manner of use, Sir," was the rejoinder; "I should not be none the wiser."

It was clear that the old man was a complete original; but his affection for Clara was a virtue which in my eyes would have atoned for any amount of eccentricity; and, as I was anxious to stand well in his good graces, I determined to fall in with his humour; accordingly I replied with a smile, "How do you make out that—did you never hear that seeing is believing?"

"Not always, Sir," he answered, "for if I'd a trusted to my eyesight—and it ain't so bad neither for a man that's no great way off sixty—I should have fancied Muster Wernon was a sitting in the library; but he told me he was not at home, hisself, and he ought to know best."

"Tell him I won't detain him long," returned I, "but that I am come on business of importance."

"Tain't of no manner of use, young gentleman," was the reply; "he told me he wasn't at home, and he said it uncommon cross too, as if he meant it, and if I was to go to him twenty times he'd only say the same thing."

"What's your name, my good friend?" inquired I.

"Peter Barnett, at your service, Sir," was the answer.

"Well, then, Peter, we must contrive to understand one another a little better. You have known your young mistress from a child, and have a sincere regard for her—is it not so?"

"What, Miss Clara, God bless her!—why I love her as if she was my own flesh and blood; I should be a brute if I didn't, poor lamb."

"Well, then, when I tell you that her happiness is very nearly connected with the object of my visit—when I say, that it is to prevent her from being obliged to do something of which she has the greatest abhorrence, that I am anxious to meet Mr. Vernon—I am sure you will contrive that I shall see him."

As I concluded, the old man, muttering to himself, "That's it, is it?" began to examine me from top to toe with a critical glance, as if I had been some animal he was about to purchase; and when he reached my face, gazed at me long and fixedly, as though striving to read my character. Apparently the result of his scrutiny was favourable, for after again saying in a low tone, "Well, I likes the looks of him," he added, "This way, young gentleman—you shall see him if that's what you want—it ain't a hanging matter, after all." As he spoke, he threw open the door of the library, saying, "Gentleman says his business is werry partickler, so I thought you'd better see him yourself."

Mr. Vernon, who was seated at a table writing, rose on my entrance, bowed stiffly to me, and, casting a withering glance on Peter Barnett, signed to him to shut the door. As soon as that worthy had obeyed the command, he resumed his seat, and, addressing me with

the same frigid politeness which he had shown on the occasion of my first visit to him, said, "I am somewhat occupied this morning, and must therefore be excused for inquiring at once what very particular business Mr. Fairleigh can have with me."

His tone and manner as he spoke were such as to render me fully aware of the pleasant nature of the task before me; namely, to make the most disagreeable communication possible, to the most disagreeable person to whom such a communication could be made. Still, I was regularly in for it; there was nothing left for me but to "go ahead;" and, as I thought of Clara and her sorrows, the task seemed to lose half its difficulty. However, it was not without some hesitation that I began:

"When you learn the object of my visit, Sir," you will perceive that I have not intruded upon you without reason." I paused; but, finding he remained silent, added—"As you are so much occupied this morning, I had better perhaps enter at once upon the business which has brought me here. You are probably aware that I have had the pleasure of spending the last few days in the same house with Miss Saville." As I mentioned Clara's name, his brow grew dark as night; but he still continued silent, and I proceeded. "It is, I should conceive, impossible for any one to enjoy the privilege of that young lady's society, without experiencing the warmest feelings of admiration and interest. Towards the termination of her visit, accident led me to the knowledge of her acquaintance with Mr. Cumberland, who I then, for the first time, learned, was your nephew. I would not willingly say anything which might distress or annoy you, Mr. Vernon," continued I, interrupting myself, "but I fear that, in order to make myself intelligible, I must advert to an affair which I would willingly have forgotten."

"Go on, Sir," was the reply, in a cold sarcastic tone of voice, "pray finish your account without reference to my feelings: I am not likely to alarm your sensibility by any affecting display of them."

As the most sceptical could not have doubted for a moment the truth of this assertion, I resumed: "From my previous knowledge of Mr. Cumberland's character, I could not but consider him an unfit acquaintance for a young lady, and, on hinting this, and endeavouring to ascertain the extent of Miss Saville's intimacy with him, I was equally shocked and surprised to learn that she was actually engaged to him, and that you not only sanctioned the engagement, but were even desirous that the match should take place. Feeling sure that this could only proceed from your being ignorant of the character of the class of persons with whom your nephew associates, and the more than questionable reputation he has thereby acquired, I considered it my duty to afford you such information, as may enable you to ascertain for yourself, the truth of the reports which have reached my ear."

"Exceedingly conscientious and praiseworthy: I ought to feel infinitely indebted to you, young gentleman," interrupted Mr. Vernon, sarcastically; "of course you made the young lady acquainted with your disinterested and meritorious intentions?"

"I certainly thought it right to inform Miss Saville of the facts I have mentioned, and to obtain her permission ere I ventured to interfere in her behalf."

As I spoke, the gloom on Mr. Vernon's brow grew darker, and I expected an out-burst of rage, but his self-control was stronger than I had imagined, for it was in the same cold, ironical manner, that he replied, "And may I ask, supposing this iniquitous engagement to have been broken off by your exertions, is Virtue to be its own reward? will you sit down content with having done your duty? or have you not some snug little scheme *en petto*, to console the disconsolate damsel for her loss? If I am not mistaken, you were professing warm feelings of admiration for my ward a few minutes since."

"Had you waited till I had finished speaking, you

would have perceived, Sir, that your taunt was undeserved. I have no wish to conceal anything from you—on the contrary, one of my chief objects in seeking this interview, was to inform you of the deep and sincere affection I entertain for Miss Saville, and of my intention of coming forward to seek her hand, as soon as my professional prospects should enable me to support a wife."

"And have you succeeded in inducing the lady to promise, that, in the event of my allowing her to break off her present engagement, she will wait for the somewhat remote and visionary contingency you have hinted at?"

"I have never made the attempt, Sir," replied I, drawing myself up proudly, for I began to think that I was carrying forbearance too far, in submitting thus tamely to his repeated insults, "my only desire is to convince you of the necessity of breaking off this preposterous engagement, which is alike unsuitable in itself, and distasteful to Miss Saville; for the rest I must trust to time, and to the unshaken constancy of my own affection, for the accomplishment of my hopes, as, had I the power to fetter your ward by a promise which she might afterwards be led to repent, nothing should induce me to make use of it."

"Really your moderation is quite unparalleled," exclaimed Mr. Vernon; "such generosity now might be almost calculated to induce a romantic girl to persuade her guardian to allow her to marry at once, and devote her fortune to the purpose of defraying the household expenses, till such time as the professional expectations you mention should be realized; and Clara Saville is just the girl who might do it, for I am afraid I must distress your magnanimity by informing you of a circumstance, of which, of course, you have not the slightest idea at present, namely, that if Miss Saville should marry with her guardian's consent, she will become the possessor of a very considerable fortune:—what think you of such a plan?"

"Mr. Vernon," replied I, "I was aware that the communication I had to make to you was calculated to pain and annoy you, and that circumstances obliged me to urge my suit at a moment most disadvantageous to its success; I did not therefore imagine that our interview was likely to be a very agreeable one; but I own I did expect to have credit given me for honourable motives, and to be treated with the consideration due from one gentleman to another."

"It grieves me to have disappointed such moderate and reasonable expectations," was the reply; "but, unfortunately, I have acquired a habit of judging men rather by their actions than their words, and forming my opinion accordingly, and by the opinion thus formed, I regulate my conduct towards them."

"May I inquire what opinion you can possibly have formed of me, which would justify your treating me otherwise than as a gentleman?" asked I, as calmly as I was able, for I was most anxious not to allow him to perceive the degree to which his taunts irritated me."

"Certainly; only remember, if it is not exactly what you approve, that I mention it in compliance with your own express request—but first, for I am unwilling to do you injustice, let me be sure that I understand clearly:—you state that you are unable to marry till you shall have realized by your profession an income sufficient to support a wife; therefore, I presume, that your patrimony is somewhat limited."

"You are right, Sir; my poor father was too liberal a man to die rich; my present income is somewhat less than £100 per annum."

"And your profession?"

"It is my intention to begin reading for the bar almost immediately."

"A profession usually more honourable than lucrative for the first ten years or so? Well, young gentleman, the case seems to stand very much as I imagined, nor do I perceive any reason for altering my opinion of your conduct. Chance throws in your

way a young lady, possessing great beauty, who is prospective heiress to a very valuable property, and it naturally enough occurs to you, that making love is likely to be more agreeable, and in the present instance more profitable also, than reading law; accordingly you commence operations, and for some time all goes on swimmingly, Miss Saville, like any other girl in her situation, having no objection to vary the monotony of a long engagement, by a little innocent flirtation; these kind of affairs, however, seldom run smoothly long together, and at some moment when you were rather more pressing than usual, the young lady thinks it advisable to inform you, that in accordance with her father's dying wish, and of her own free will, she has engaged herself to the nephew of her guardian, who strangely enough happens to be an old schoolfellow of yours, against whom you have always nourished a strong and unaccountable feeling of dislike. Here then was a famous opportunity to display those talents for plotting and manoeuvring which distinguished Mr. Fairloagh even in his boyish days; accordingly a master-scheme is invented, whereby the guardian shall be cajoled and brow-beaten into giving his consent, enmity satisfied by the rival's discomfiture and overthrow, and talent rewarded by obtaining possession of the young lady and her fortune. As a first step you take advantage of a lover's quarrel, to persuade Miss Saville that she is averse to the projected alliance, and trump up an old tale of some boyish scrape, to induce her to believe Cumberland unworthy of her preference, ending doubtless by modestly proposing yourself as a substitute. Inexperience and the natural capriciousness of woman stand your friend; the young lady is gained over, and, flushed with success, the bold step of this morning is resolved upon. Such, Sir, is my opinion of your conduct. It only remains for me to inform you that I have not the slightest intention of breaking off the engagement in consequence of your disinterested representations, nor, under any circumstances, would I allow my ward to throw herself away upon a needy fortune-hunter. There can be nothing more to say, I think; and as I have some important papers to look over this morning, I dare say you will excuse my ringing the bell."

"One moment, Sir," replied I, warmly, "although your age prevents my taking notice of the unprovoked insults you have seen fit to heap upon me—"

"Really," interposed Mr. Vernon, in a deprecating tone, "you must pardon me; I have not time for all that sort of thing to-day."

"You SHALL hear me!" exclaimed I, passionately; "I have listened in silence to accusations calculated to make the blood of any man, worthy to be so called, boil in his veins,—accusations which, at the very moment you utter them, you know to be entirely false: you know well Miss Saville's just and deeply-rooted aversion to this match, and you know that it existed before she and I had ever met; you know the creditable nature of what you term the 'boyish scrape,' in which your nephew was engaged,—a scrape which, but for the generous forbearance of others, might have ended in his transportation as a convicted felon; and this knowledge (even if you are ignorant of the dishonourable and vicious course of life he now leads) should be enough to prevent your sanctioning such a marriage. I pass over your insinuations respecting myself in silence: should I again prefer my suit for Miss Saville's hand to you, it will be as no needy fortune-hunter that I shall do so; but once more let me implore you to pause—re-consider the matter—Inquire for yourself into your nephew's pursuits—ascertain the character of his associates, and then judge whether he is a fit person to be entrusted with the happiness of such a being as Clara Saville."

"Vastly well, Sir! exceedingly dramatic, indeed!" observed Mr. Vernon, with a sneer; "you really have quite a talent for—gentle comedy, I think, they call it; you would be perfect in the line of character termed

the 'walking gentleman'—have you ever thought of the stage?"

"I perceive," replied I, "that by remaining here, I shall only subject myself to additional insult: determined to carry out your own bad purpose, you obstinately close your ears to the voice alike of reason and of conscience; and now," I added, in a stern tone, "hear my resolve: I have promised Miss Saville to save her from Richard Cumberland; as the fairest and most honourable way of doing so, I applied to you, her lawful guardian and protector; I have failed, and you have insulted and defied me. I now tell you, that I will leave NO means untried to defeat your nefarious project, and, if evil or disgrace should befall you or yours in consequence, upon your own head be it; you may smile at my words, and disregard them as idle threats, which I am powerless to fulfil, but remember, you have no longer a helpless girl to deal with, but a determined man, who, with right and justice on his side, may yet thwart your cunningly-devised schemes:—and now, having given you fair warning, I will leave you."

"Allow me to mention one fact, young sir," returned Mr. Vernon, "which demands your serious attention, as it may prevent you from committing a fatal error, and save you all further trouble. Should Clara Saville marry without my consent, she does so penniless, and the fortune devolves upon the next heir; ha!" he exclaimed, as I was unable to repress an exclamation of pleasure, "have I touched you there?"

"You have, indeed, Sir," was my reply; "for you have removed the only scruple which stood in my way. No one can now accuse me of interested motives; 'needy fortune-hunters' do not seek to ally themselves to portionless damsels; allow me to offer you my best thanks for your information, and to wish you good morning, Sir."

So saying, I rose, and quitted the room, leaving Mr. Vernon, in a state of ill-suppressed rage, to the enjoyment of his own reflections.

On entering the hall, I found old Peter Barnett awaiting me. As I appeared, his stiff features lighted up with a most sugacious grin of intelligence, and, approaching me, he whispered,

"Did ye give it him strong?" (indicating the person he referred to, by an expressive jerk of his thumb towards the library door.) "I heard ye blowing of him up,—but did ye give it him reg'lar strong?"

"I certainly told Mr. Vernon my opinion with tolerable plainness," replied I, smiling at the intense delight which was visible in every line of the strange old face beside me.

"No! Did ye?—did ye? That was right," was the rejoinder. "Lor! how I wish I'd been there to see; but I heard ye, though—I heard ye giving it to him," and again he relapsed into a paroxysm of delight.

"Peter," said I, "I want to have a little private conversation with you,—how is that to be managed?—is there any place near where you could meet me?"

"You come here from Hillingford, didn't ye sir?"

I nodded assent—he continued,

"Did you notice a hand-post which stands where four roads meet, about a mile and a half from here?"

"I saw it," returned I, "and even tried to read what was painted on it, but of course, after the manner of all country direction posts, it was totally illegible."

"Well, when you get there, take the road to the left, and ride on till ye see an ale-house on the right hand side, and stay there till I come to ye."

"I will," replied I; "but don't keep me waiting longer than you can help—there's a good man."

An understanding grin was his only answer; and, mounting my unpleasant horse, (who seemed much more willing to proceed quietly, when his head was turned in a homeward direction,) I rode slowly through the park, my state of mind affording a practical illustration that Quintus Horatius Flaccus was about right

in his conjecture, that care sometimes indulged herself with a little equestrian exercise on a pillion.¹

A LAND JOURNEY ROUND THE WORLD.²

THE words "A voyage round the world," have certainly lost much of their former power to charm the ear, or persuade the reader, careful of his pounds and shillings, into a purchase of two portly octavos, habited in their truly respectable coats of publishers' embossed purple. So many tourists have scaled the Andes, and breakfasted on some peak of the Himalayas, that the bewildered reader is often at a loss whether he should buy the last Voyage to the Antipodes, just published, or wait for the next pleasant excursion to the Chinese sea, advertised as "in the press." Notwithstanding the abundance of such books, and the frequency of travels through each of the three hundred and sixty degrees of longitude, a voyage round the world must still claim the attention of all who believe in the existence of a real world of men and women beyond the boundaries of their own quarter of the globe. Such books are to the quiet residents in our English homes, what the telescope is to the astronomer—the means of bringing remote empires within our view, so that we hear the merry song of the Kamackathlial, enjoy a pleasant chat with the Cossacks on the banks of the Don, and peep into the Red Indian's wigwam on some wide Savannah of the far West. Such knowledge is but "book-learning" it may be said, and can impart but little available information of the regions described;—true, perhaps, if by available you mean the acquisition of opinions necessary for forming a settlement of Irish cotters on the Volga, or for the organization of a railway company to unite lake Baikal with the Caspian sea. But, for the rectification of our petty prejudices, which so often hang over us like thick fogs, and for the enlarging of our sympathies, so that we may appreciate the qualities of other people, these narratives are most useful. The merchant, the lawyer, the statesman, and the divine, may gain from such sources the means of correcting the conclusions drawn from our own limited observations, or too partial studies. A "land journey round the world" is peculiarly adapted to produce such results; as it brings us into contact with a greater variety of races, manners, and institutions than a circumnavigation of the earth can do. In the former case the traveller must keep up a daily intercourse with many people and tribes, in order to procure food for himself and his horses, and this inevitably forces upon his attention a thousand circumstances connected with national habits, language, religion, and government, which the sailor, who traverses a wide ocean, cannot observe. Amongst such voyages, that recently made by Sir George Simpson through the northern regions of America, Asia, and Europe, possesses a high degree of interest for all Englishmen. It was undertaken by the governor of one of our most famous commercial incorporations, the Hudson's Bay Company, and develops the resources of those vast regions belonging to England and Russia, which girdle the globe to the north. The two volumes, therefore, carry us from Liverpool across the Atlantic, through the whole breadth of the American continent, across Behring's Straits, and into the heart of Siberia, leading us through ancient Tartar cities, and the strange swarms dwelling on the wild Asiatic steppes,

whilst the grand panorama is terminated by "Moscow the Holy," and "Petersburg the magnificent." To the first volume is prefixed a map, through the centre of which runs a red line marking out the author's route, and thus fixing the eye of each reader on the very track; whether in forest steppe or mountain, along which Sir George Simpson found the valuable materials of his book. On one side this line branches off from Liverpool to Boston, and on the other it returns through the Baltic to London; thus completing the great circle of adventures which few are permitted to tread.

The governor sailed from Liverpool in the *Caledonia*, a steam-ship of 1,300 tons laden, and 450 horse power, on the 4th of March, 1841, being accompanied by a secretary, and four or five agents of the company.

Although our traveller was compelled to make part of his journey on the sea, we need not describe the incidents of the voyage between Liverpool and Boston. The *Caledonia* was caught, and well buffeted by the very tempest in which the President is supposed to have foundered; and with this bit of information, unvarnished by the slightest attempt to paint mountain waves, the labours of the ship, or the fierce battle of the clouds, we must take the liberty of passing Newfoundland, and its fish, and turning our shoulder upon Halifax, in order to land the reader at once in the streets of Boston, which was entered on the morning of March 20th. Though the people of this town did once throw good tea into the bay for the service of the finny tribes, instead of first gently brewing it in their tea-pots, and fighting afterwards; yet our traveller likes the place well, for it reminded him most strongly of England. He says, "Even before landing, the gently undulating shores of the bay, highly cultivated, and partially covered with snow, had recalled to my memory the white cliffs and green hills of England; and within the town, the oldest and finest in the Union, both the buildings and the inhabitants had a peculiarly English air about them. Moreover, in many respects that do not strike the eye, Boston resembles her fatherland. She is the centre and soul of those religious establishments which have placed the United States next to Great Britain in the divine task of shedding on the nations the light of the gospel."

From Boston he passed to Montreal, which the party reached by crossing the ice of the St. Lawrence, yet fettered by its winter chain. The sight of this metropolis, and the remembrance of its former subjection to France, set Sir George Simpson on a course of reflection upon the differences between the French and English races. "On this flourishing emporium I shall offer only this single remark, that it contrasts, as it in a nutshell, the characteristic qualities of the two races that inhabit it. The French were the original possessors of the city, while the English at first found themselves to be houseless strangers in a strange land. But the latter have found their way by inches from the water's edge, into nearly all that constituted Montreal in the days of Wolfe and Amherst; and the former have been driven from their ancient seats into the newer sections of the city, being gradually jostled out, even there, from every thing like a thoroughfare of commerce."

We shall not detain the reader by entering upon the subject thus suggested; but take for granted that in all matters relating to commerce and colonization, the English race excels the French (the Frenchman will, of course, forgive us). Sir George now prepared for the voyage up that system of lake and river navigation which connects the Atlantic with the regions at the base of the rocky mountains. "By nine o'clock our two canoes were floating in front of the house, on the Lachine canal, constructed to avoid the famous rapids of St. Louis. The crews—thirteen men to the one vessel, and fourteen to the other—consisted partly of Canadians, but principally of Iroquois from the opposite village of Iroquois, the whole being under the

(1) "Post equitem sedet extra Currus."

(2) Narrative of a Journey round the world during the years 1841 and 1842, by Sir George Simpson, Governor-in-chief of the Hudson's Bay Company's territories in North America.

charge of my old and faithful follower, Morin. To do credit to the concern in the eyes of the strangers, the voyageurs had been kept as sober as voyageurs could be kept on such an occasion; and each one had been supplied with a feather for his cap. This was all very fine, but the poor fellows were sadly disappointed that a north-wester which was blowing prevented the hoisting of our flags.

"The canoes, those tiny vehicles of an amphibious navigation, are constructed in the following manner:—The outside is formed of the thick and tough bark of the birch; the sheets being sewed together with the root of the pine-tree, split into threads, and the seams gummed to make them air-tight. The gunwales are of pine or cedar, of about three inches square; and in their lower edges are inserted the ribs, made of thin pieces of wood, bent to a semicircle. Between the ribs and the bark is a coating of lathing, which, besides warding off internal injury from the canoe, serves to impart a firmness to the vessel. These canoes are generally about thirty-five feet from stem to stern, and are five feet wide in the centre, gradually tapering to a point at each end, where they are raised about a foot. When loaded, they draw scarcely eighteen inches of water; and they weigh between three hundred and four hundred pounds."

On one of the silent lakes through which the journey lay, the advance of modern science was marked by a steam-boat, gliding over waters where but a few years since the canoe of the Indian only rode. Thus is civilisation pushing her way into the red man's former home, and beckoning the hardy white emigrant to build his log-house on the site of the banished wigwam.

The timber-cutters, called *lumberers*, are, in their rough way, also preparing a road by which the energies of the Saxon race may force their influence into the hearts of these wilds. The life of a traveller in those regions has not much of "pleasuring" in it, as the reader will readily admit when he reads the following brief description of the mode of encamping:—

"We selected, about sunset, some dry and tolerably clear spot; and, immediately on landing, the sound of the axe would be ringing through the woods, as the men were felling whole trees for our fires, and preparing, if necessary, a space for our tents. In less than ten minutes our three lodges would be pitched, each with such a blaze in front as virtually imparted a new sense of enjoyment to all the young campaigners, while through the crackling flames were to be seen the requisite number of pots and kettles for our supper. Our beds were next laid, consisting of an oil-cloth spread on the bare earth, with three blankets and a pillow, and, when occasion demanded, with cloaks and greatcoats at discretion; and, whether the wind howled or the rain poured, our pavilions of canvass formed a safe barrier against the weather. While part of our crews, comprising all the landmen, were doing duty as stokers, and cooks, and architects, and chambermaids, the more experienced voyageurs, after unloading the canoes, had drawn them on the beach with their bottoms upwards, to inspect, and, if needful, to renovate the stitching and the gumming; and as the little vessels were made to incline on one side to windward, each with a roaring fire to leeward, the crews, every man in his own single blanket, managed to set wind and rain and cold at defiance almost as effectually as ourselves."

"Weather permitting, our slumbers would be broken about one in the morning, by the cry of 'Lève, lève, lève!' In five minutes more—was to the inmates that were slow in dressing! the tents were tumbling about our ears, and within half an hour the camp would be raised, the canoes laden, and the paddles keeping time to some merry old song. About eight o'clock, a convenient place would be selected for breakfast, about three quarters of an hour being allotted for the multifarious operations of unpacking and repacking the equipage; and, while all these preliminaries were arranging, the hardier

among us would wash and shave, each person carrying soap and towel in his pocket, and finding a mirror in the same sandy or rocky basin that held the water. About two in the afternoon we usually put ashore for dinner; and, as this meal needed no fire, or at least got none, it was not allowed to occupy more than twenty minutes or half an hour.

"Such was the routine of our journey, the day, generally speaking, being divided into six hours of rest and eighteen of labour. This almost incredible toil the voyageurs bore without a murmur, and generally with such a hilarity of spirit as few other men could sustain for a single forenoon.

"But the quality of the work, even more decidedly than the quantity, requires operatives of iron mould. In smooth water, the paddle is plied with twice the rapidity of the oar, taxing both arms and lungs to the utmost extent; amid shallows, the canoe is literally dragged by the men, wading to their knees or their loins, while each poor fellow, after replacing his drier half in his seat, laughingly shakes the heaviest of the wet from his legs over the gunwale before he again gives them an inside berth." Those, therefore, who wish to see the least trodden regions of the world, and desire an acquaintance with the magnificence of Nature in her wildness, must give up all notions of a drawing-room life.

The intense cold of the winter in these regions may be estimated from the fact that on the 16th of May Sir George Simpson received intelligence that "the ice of Lake Superior was still as firm and solid as in the depth of winter." The season was, nevertheless, so warm at this time, that the party read and wrote in the open air by moonlight, thus proving the vast amount of caloric absorbed by the ice before it reaches the point of liquefaction. The Governor, after passing through Lake Superior, found himself amongst the Indian tribes, listening to their wild superstitions, and attempting to alleviate the destitution and misery of these little understood races. A belief in magic prevails amongst them, and sometimes leads to slaughter. Their private wars are still numerous; and a savage fury often spreads desolation over valleys which would be beautiful were their wild inhabitants far away. We read of a shipwrecked crew belonging to one of the Company's vessels being murdered; of deep plans laid to cut off travelling parties; and we find the Governor himself compelled on one occasion to take decided measures for repelling a murderous attack from a tribe of these savages.

The Indians are not unfrequently threatened by famine, and many must in severe seasons perish in their trackless woods. Whenever a civilized settlement can be reached, thither the wretched people throng to receive from the white man's hands the refuse of his table. The following passage illustrates these periodical calamities, and also the religious notions sometimes found in the elders of a tribe.

"Some three or four years ago, a party of Sautteaux being much pressed by hunger, were anxious to cross from the mainland to one of their fishing stations, an island about twenty miles distant; but it was nearly as dangerous to go as to remain, for the spring had just reached that critical point when there was neither open water, nor trustworthy ice. A council being held to weigh the respective chances of drowning and starving, all the speakers opposed the contemplated move, till an old man of considerable influence thus spoke: 'You know, my friends, that the Great Spirit gave one of our squaws a child yesterday. Now, he cannot have sent it into the world to take it away again directly; and I would, therefore, recommend our carrying the child with us, and keeping close to it, as the assurance of our own safety.' In full reliance on this reasoning, nearly the whole band immediately committed themselves to the treacherous ice; and they all perished miserably, to the number of eight-and-twenty."

Some of the mightiest tribes, as the Sautteaux, for instance, have dwindled to a few thousands, and though dispersed over a wide tract, can scarcely subsist. These lazy people will rather undergo every privation than till their rich lands, and thus their ultimate extinction seems inevitable.

The Hudson's Bay Company have tried to check one element of ruin by stopping the distribution of spirits to the Indians; and thus rescuing the ignorant savages from the fatal consequences ever following the use of such a poison among barbarous tribes. The following account of a meeting between the Governor and some of the Chippewas will give to the English reader a notion of the customs of those distant dependants, if not subjects, of Britain.

"After traversing Lac la Pluie, and five or six miles of the river of the same name, we reached our post between ten and eleven in the evening, being saluted by about a hundred Sautteaux, the warriors of a band of about five hundred souls; and these savages, after accompanying us to the fort with one of their wild songs, presented me with a letter written by one of their own nation, who had been educated in Canada, and was now acting as interpreter for the Wesleyan missionary of the establishment: the document ran thus:—

"Father,—We the undersigned chiefs, and principal men of the Indians, whom you now see encamped around this fort, do hereby present our good wishes on your safe arrival. It is not known to any of us that you ever was so requested by any of the tribes inhabiting this country, as that which we now humbly request, which is, that you will be pleased to hear the words of your children, who are now waiting to address you on things which concern the welfare of themselves and their children.

"And now, Father, we know that you are the governor of this our common country, and we know that your ear is open to the words of all therein.

"We humbly hope that it may be so to uswards.

"Signed on behalf of our people:—

"NAWAQANNYAN,
MATWAYATH,
KECHENGAH-TE-UX,
MASHONOYA,
WA-NA-HIE."

"In accordance with this request, I invited 'my children' to attend me at four in the morning; and instead of pitching our tents among so many needy friends we made our beds within Fort Frances. But while I was napping, the enemy were pelting away at me with their incantations. In the centre of a conjuring tent—a structure of branches and bark, forty feet in length by ten in width,—they kindled a fire; round the blaze stood the chiefs and medicine-men, while as many of the others as could find room were squatted against the walls; then to enlighten and convert me, charms were muttered, rattles were shaken, and offerings committed to the flames. After all these operations were supposed to have done their best, the hitherto silent spectators, at a signal given, started from their hams to their feet, and marched round the magic circle, singing, whooping, and drumming in horrible discord. With occasional intervals, which were spent by the performers in taking the fresh air, this exhibition was repeated during the whole night; so that when the appointed hour arrived the poor creatures were still engaged in their superstitious observances. True to their time, two processions, one from either side of the establishment, met in the open square of the fort, waving their banners and firing their guns. They had all dressed, or rather decorated themselves for the occasion; their costumes being various enough to show that fashion, as it is called, had not yet got so far to the westward. Their glossy locks were plaited all round the head into tails, varying in number according to the

taste of the owner; at the ends of the different tics were suspended such valuable ornaments as trinkets, coins, buttons, and clippings of tin; their heads adorned with feathers of all sorts and sizes; and their necks encircled with rows of beads at discretion, and large collars of brass rod.

"As to clothing, properly so called, every one had leggings and a rag round the loins, while some of the chiefs, with the addition of scarlet coats and plenty of gold lace, had very much the cut of parish beadies.

"The staple commodities, however, appeared to be paint and chalk. The naked bodies of the commoners displayed an inexhaustible variety of combinations of red and white, often surpassing in brilliancy, as well as in tightness of fit, the dashing uniforms of the grandees; and every face, whether noble or ignoble, was smeared entirely out of sight, the prevailing distribution appearing to be, forehead white, nose and cheeks red, mouth and chin black.

"Meanwhile we had been stirring, to the utmost of our ability, not to be outdone in magnificence. Lord Caledon and Lord Mulgrave had donned their regimentals; and we civilians had equipped ourselves like so many mandarins, in our dressing-gowns, which luckily happened to be of rather showy patterns and hues. After much shaking of hands, about sixty of the Indians squeezed themselves into the apartment, while the others, with the women and children, remained outside. When all were seated each chief in turn sent round his calumet among us, in the costliness of which they appeared to emulate each other. All these preliminaries being concluded, the spokesman of the party stepped forward, and first ostentatiously displaying a valuable present of sundry packs of furs, he commenced his harangue in a bold and manly voice, with great fluency and animation. After a tedious prelude, which I was obliged to cut short, about the creation, the flood, &c., the object probably being to show how, and why, and when, the Great Spirit had made one race red and another white, he plunged at once from this transcendental height into the practical vulgarities of rum, complaining that we had stopped their liquor, though we, or at least our predecessors, had promised to furnish it 'as long as the waters flowed down the rapids.' 'Now,' said he, in allusion to our empty casks, 'if I crack a nut will water run from it?' In reply I explained to the Indians that spirits had been withdrawn, not to save expense to us, but to benefit them. I then pointed out the advantages of temperance, promising them a small gift of rum every autumn, not as a luxury, but as a medicine. In thanking them for their present of furs, I told them that, besides receiving a suitable present in return, they would be paid the usual price for each skin. In conclusion, there was another shaking of hands, and then this grand council between the English and Chippewas broke up about six o'clock, to the satisfaction of both nations."

These savages have also the vices of Europeans added to their own, for gaming is carried on amongst some tribes, to an extent which those alone can estimate who know the craving for rude excitement which animates the untutored man.

In one respect most of our romancers have misrepresented the Indians, having painted them as a taciturn people, who preserve an oppressive silence amidst scenes of extremest peril, and rarely descending to such commonplace matters as laughing or chatting. But what is the real state of the case? That no people excel the Indians in loquacity amongst themselves, or when in the society of whites well known to them; neither Neapolitan nor Parisian lounge has more small talk at command than these children of the West, when indulging the luxury of smoking in their rude huts.

The efforts of the Christian missionary, whether Roman Catholic or Protestant, among these people, have not, we fear, led to any important results. They may be bought over to perform certain services, or

retained in an exterior profession of Christianity by the hope of gifts, but cases of conversion are most rare.

Probably the right mode of reaching these undisciplined hearts has yet to be adopted on a comprehensive plan. The variety of dialects prevailing amongst the tribes may also retard the progress of civilisation and Christianity, for Sir George Simpson describes the diversities of speech in some parts as countless; and races living in the same district are often unable to communicate with each other. This is another sure result of barbarism, which thus tends to perpetuate itself by isolating its victims from surrounding races.

(To be continued.)

ERAS OF ENGLISH CIVILIZATION.*

7. THE ERA OF COMMERCIAL GREATNESS.

Few things are more startling to the historian than the extraordinary contrasts presented by ages separated from each other by wide periods. At one time, the seas round a country are undisturbed by a single keel, excepting a few miserable boats belonging to the rude fishers of the coast; whilst at another, every bay and strait glistens with the sails of vessels hastening from the most distant shores. Such a contrast is presented to the English historian. Could we place ourselves in a small coracle on the Thames, in the time of Cæsar, or Agricola, what scenes should we behold! The river flowing through a swampy district to the sea; the sullen ripple of its wide, sedgy stream unrelieved by sound of heaving anchor or busy oar; save that, at distant intervals, some canoe darts suddenly across the stream, and is as suddenly lost in the dark underwood of the banks. Not even the Arch Druid himself could have imagined a time when the ships of a hundred nations should brighten that stream; when the name of the ancient river would be uttered by the native of either pole; when princes from the four quarters of the earth should visit on its banks a city containing more people than the whole island once held; when stone should span the flood, and iron's hide upon it. When may the era of English commerce be said to begin? Not until *after* the Reformation; whatever trade existed previously, being too limited to deserve our regard when considering so remarkable an era. Through many ages, from the Saxon times to the reign of Henry VII., we can trace a thin stream of commerce, which, though it afterwards widened into a noble river, was once inferior to that which brought wealth and honour within the Italian cities of the middle ages. But when the Reformation brought England into collision with the powerful states of Europe, a spirit of enterprise took possession of our merchants and navigators, by which trading companies were formed, and hazardous voyages undertaken for the discovery of unknown regions. In such attempts the first gentlemen of the land combined, fitting out ships at their own expense, and hazarding both property and life in the attempt to extend the power of their country. In consequence of such vigorous efforts, the shores of the new world soon beheld the sails of England's ships; the northern ocean was penetrated by brave spirits like Sir Hugh Willoughby and Richard Chancellor, and a commerce opened with the interior of Russia; whilst the basis of our Indian triumphs was laid by the establishment of the Turkey company. The voyages of Davis, Hudson, Baffin, and a host of equally daring men, brought vast regions of America into connexion with England, and opened a channel through which the commerce of the West might pour through the gates of the North.

Though our colonial dependencies arose to importance in times subsequent to the period of Elizabeth, it

is to the impulse then communicated, that we must trace the wealth which has long flowed from these sources. The advantages derived from colonies depend upon the peculiar management acquired through long experience by a commercial people; and it is, therefore, to the strong development of the navigating and trading spirit during the reigns of Elizabeth and James, that we must partly ascribe the present greatness of England. The rise of a commercial era involves that of a *manufacturing* one—and we are now surrounded by the ships, mills, mine-works, and town-like factories produced by the mercantile genius of our people. The final results of such a system are concealed from the view of the wisest statesmen; but we may hope that no *necessary* connexion exists between corruption and commerce, and that our land may long continue to use wisely the power conferred by such an extended trade.

The effects of this era upon the civilization of England is, perhaps, more strongly marked than the results of all the other agencies. Our literature, laws, and manners indicate the existence of the incessant operations of a commercial system, which comprehends the region between the Andes and the Chinese sea within its grasp. Hence the ceaseless activity in all matters bearing on the *visible* and *useful*, the worship of what is called the practical, and the too little sympathy with *high art*, and all subjects partaking of the poetic, found amongst the *majority* of our countrymen.

This tendency to the immediately useful and productive, has doubtless in some cases affected the fame of our philosophers, as it has withheld some from that wide and scientific treatment of a subject on its *fundamental* and general principles, which can alone give completeness to scientific researches, though often visited amongst us with the charges of "theorizing," "fanciful," and so forth. It cannot, however, be denied that this very tendency to the practical, produced by our commercial habits, has kept our statesmen and ruling characters within the useful sphere of action, if it has withheld them from the brilliant one of theory. We have, therefore, made good laws whilst other nations were discussing constitutions, and secured liberty whilst our neighbours have been wrangling about its simplest definitions.

The power of political self-government is, therefore, more perfectly exemplified in this country than in any European state, and the vigour thus gained may be deemed more than an equivalent for the loss of the advantages arising from a less utilitarian mode of surveying all things. We have thus slightly dwelt on the political results which have appeared since the commencement of our commercial era, because we feel assured that all the coming changes of the English social system, and the course of our future civilization, must be intimately dependent upon the commerce of England. The state of our manufacturing population, the progress of constitutional changes, and the nature of our relations with other countries, are all matters of the deepest importance, and the essential elements of our civilization. But does not every man see that *these* are the very matters which will be determined for good or evil by the influence of our commercial system? Hence it is that statistics have recently assumed such an importance in the eyes of our leading politicians, and that minds conversant with the speculations of a high philosophy have devoted their powers to grasp the complicated details of so vast a subject. Let no reader, therefore, suppose that we have ascribed too much to the influence of the commercial era, which is now presenting us with some of the deepest problems ever proposed for solution to the human understanding.

8. THE ERA OF THE PHYSICAL SCIENCES.

This is too closely related to the subject just mentioned to be omitted, and its vast influence on our civilization compels us to regard for a few moments the

(1) Concluded from p. 245.

(2) Steam-boats.

wondrous results which in these ages have increased the resources of all Englishmen. This era may be said to have began in the reign of Charles II., when the investigations of the Marquis of Worcester on the steam-engine, and the researches of Boyle in chemistry, ushered in a long series of brilliant discoveries, which are probably but the stepping-stones to others equally important. The peculiarity of these sciences is their adaptation to the common wants of all men, and they thus become civilizing agents of vast influence. Whilst acute experiments are confined to the laboratory of the philosopher, they cannot be enumerated amongst the causes which affect the general progress of men; but the moment some fact in physics becomes the property of the nation, whether it be a new machine, a new metal, or a new dye, that instant the discovery begins to influence the national energies. What effects have not the combination of a metal and heated water, of iron and steam, produced in this island within the last twenty years! The arts of war and peace have undergone a total change since Watt first pondered over his engines, and the whole national mind has received a fresh stamp. The laboratory of the chemist has combined with the art of the engineer, to produce new means of increasing physical good; and from these united causes it happens that our merchants are able to sell their goods in the far West of America, and the villages of China. Not a single vegetable, animal, or mineral substance is now left unquestioned by the crowd of experimentors who look upon the regions of air, earth, and water as the sources of yet undiscovered treasures. Thus the atmosphere is now required to become the winged steed by which a new kind of railway is to supersede the acting of steam; electricity is requested to act the part of smelting furnaces in our copper works; while the same agent is also expected to aid the agriculturist, and develop the fulness of his resources. From a common vegetable substance and an acid, a power is drawn by which the artillery of war receives an increase of power; whilst from ether is extracted an anodyne more perfect than ever appeared to the ancient alchemist in his golden visions. Such an unfolding of the resources of physical science is now acting with extraordinary energy on the character of the English people, leading the multitude into new lines of occupation, and giving fresh employment to the capital of the manufacturer. Bright dreams doubtless flashed upon the view of Bacon when he had completed his great work, "Novum Organon," of grand discoveries which should one day startle the nations, and render the mighty powers of nature the servants of the human race. But some of the results just noticed were surely unimagined even by that high priest and prophet of philosophy; and are we not at this hour on the verge of other discoveries which shall conduct us behind that veil where the mysteries of the universe are working? Are we not trembling on the verge of a new region in philosophy, and awaiting in almost breathless silence the long sought responses from the inner shrines of nature? Are not the old established laws of mind themselves mystified and disturbed by the strange facts undoubtedly connected with mesmerism and clairvoyance? To what is all this physical development tending? What keys will it supply to other mysteries? What secret paths to a deeper science will it bring to view? These are the questions forced from men when surrounded by these great phenomena; to answer them may be impossible; but one thing is certain, that every application of new discoveries to useful arts and practical science will be eagerly grasped at by the English mind. Hence must arise a long succession of causes, forcing us more than ever into the region of utilitarianism, and thus affecting the character of our civilization. Not a machine now moves in England, not an experiment is

performed, not a patent taken out, without influencing, in some indirect way, the tone of the national mind. Thus, to all the agencies above mentioned, and to the eras already described, must be added the multiplied agencies of science.

Such are some of the eras through which the British empire has passed, and under the influence of which it now lives. Other periods might be noticed, did space allow, and a more full discussion given to the different sections, were not the limits of this article fixed. This must, therefore, be the writer's apology to those readers who may have desired a more extended illustration of the great causes of English civilization. The eras already mentioned do, however, comprehend the more important agencies under which our liberties have expanded, our national peculiarities moulded, and the faults or excellencies of our social system developed. To speculate upon the possible results, in ages to come, of the civilization to which we have reached, is of course beside our present purpose, which is rather to present a general outline of the past, than to exhibit the probabilities of the future. Each of the agencies mentioned in this article are still working around us; for, though originated in bygone ages, not one of these causes has ceased to act; and thus upon the present period the powers of all preceding epochs are operating with an accumulated force.

To act well in our own age, it is sometimes necessary to survey the past, and thus qualify ourselves to appreciate the principles now in operation, and to detect the tendencies for good or evil in existing institutions.

Such a view of the national progress is, indeed, the duty of every man who desires to act wisely in the emergencies of these times; and if this brief review of the Eras of English civilization should aid the thoughtful reader, and dispose him to further investigation, one great object of the writer and publisher will have been attained.—W. D.

COUNTRY SKETCHES.

No. III.

THE VILLAGE OF HERTINGFORDBURY, AND PANSHANGER.

THERE is no country in the world that can exhibit to the gaze of a traveller more perfect specimens of rustic life than England. The church, the retired grave-yard, the cottages, the little stream, the mill, the squire's hall, the parsonage, the wood, the common, the footpath, fields,—all these are combined, and, as it were, sorted together; each in its most natural and most picturesque position. England abounds in such pictures.

They are very suggestive, and contain a world of meaning, if he who loiters in them will but strive to find it out.

That they are peculiar to this favoured land, will be soon ascertained by those who migrate annually in countless swarms, to admire the beauties of the Rhine, or the Danube. Surely nowhere is there the same amount of heatness, order, of richly timbered and highly cultivated country, as in Britain.

At a distance of about twenty miles from London, and very approachable therefrom by means of the Northern and Eastern Railway, lies a village, every way worthy to be enrolled as one of the pleasantest spots upon earth. It has its attractions, too, for those whose admiration of beauty is not confined exclusively to the works of Nature. At one end of it rises Panshanger, the seat of the Earl Cowper, whose gallery of pictures is famous for the masterpieces it contains.

The village of Hertingfordbury may bring to mind the writings of a lady who is now, alas! no more—Mrs. Grant of Laggan. Many days were passed at the rectory there by that amiable authoress, in the society of her

(1) We allude to the recent discovery of a mode of smelting copper by means of galvanism.

(2) The use of ether in surgical operations.

friends, Dr. and Mrs. Hook. Many of her letters are dated therefrom, and Hertingfordbury is ever mentioned by her with pleasure and delight. The scenery around is all English. The mill with the stream formed by the river Maran, the trim and orderly post-house, the serpentine street, terminating in a little eminence, which is crowned by the church, whose spire may be seen far and wide; all is thoroughly English. It is impossible to be in the village, for however short a time, without conjuring up a hundred scenes of peaceful happiness and blissful enjoyment. The church is not a very pretending structure, but is ample enough for the requirements of the parishioners.

On each side of the door which faces the principal path, are two corbels of grotesque design; both are uninjured by time or weather.

In the interior, there are two altar tombs, one on the right of the altar, to the memory of a lady of the Minne family, the other consisting of whole-length recumbent effigies in marble, to commemorate the existence of one William Harrington, his wife and daughter.

How quaintly the record is kept, may be seen from the following verses, which are inscribed on two tablets over the figures.

It is perhaps scarcely necessary to remark, that the spelling, etc., of this strange conceit, are all faithfully copied from the original.

"Table tel of her no Wonder,
Do but shew that she lies under;
'Tis only fit from stone to passe
To name her grave, and say she Was.
Let Poet's Prayes have a roome
Where Virtue hath not built a Tombe;
'The story of her blessed Dyes
Needes no such help her fame to Rayse.
The Husband he shall shew his Wit,
The pattered of her spotless Life;
Which, when their Houre is come to die,
Shall be their Daughter's Legacy.
And they shall likewise leave it theirs;
So shall her fame live many Yeares,
And last so long, till thou shalt be
As very Dust thyself as shee.

"The other having told so Much
Of her, do thou give him a touch:
Say but, here lies, and it is done,
What's left of William Harrington:
The rest of him his friends shall speake;
Or, if they do not, thou mayest breake
Dissolved to water, for if here
Can die, what lasting is in thee?
He, the whole practice of whose Life
Was with the world a virtuous Strife,
And of that strife the double End
Was first his God, and then his Friends.
So that he made himself the one
Of many fit for where he's gone.
Who knoweth this and joys not now
For both's a verier stone than Thou."

The meaning is not very obvious at a first reading, and requires some like antiquated train of thought to connect and arrange its peculiarities into tangible substance. There is a curious tribute to Mr. Henry Cowper, who was for forty years clerk assistant of the House of Lords. It consists of a decorated arch and niche with simple inscription. Adjoining the church, and closing entirely one window, is the Cowper Mausoleum. Entrance is obtained through a railed door. It is very small and dimly lighted, and contains only two monuments. These are both executed in marble; the largest came from Italy in 1764. The principal figure is an Angel pointing to a halo surrounded by cherubims, while on one side a boy with wings is weeping and holding a medallion bust of the Earl William. Very little time need be spent on this piece of sculpture, which is of a very different character to its neighbour. To say that this

latter is by Roubillac, is to prepare the beholder for something worth the pausing. It is a small group, but one of high merit, and will reward an attentive examination of its details. It was erected by Theodora, the second and surviving wife of Spencer Cowper, Esq. justice of the Court of Common Pleas. It represents the judge in his official costume, in the attitude of listening to a cause; on one side stands Truth with a mirror; on the other, Justice, blindfolded, holding a sword and scales. The countenance of the chief figure is very fine: the forefinger raised to the cheek, indicates sufficiently the deliberate weighing of evidence, that seems to be dwelling in the very expressive features. The robes are remarkably easy and flowing. The intricacies of some lace-work are most exquisitely real, and look as fragile as the reality. The monument is placed rather too high, and loses somewhat of its beauty in consequence. The darkness of the place militates much against its general effect. It may be remembered, that it was from this branch of the family that the poet Cowper sprang.

Leaving the church, and a very picturesque carpenter's yard, the way to Panshanger lies completely through the village, passing the water-mill and arriving at a small lodge, and so on up an eminence bordered by a hedge-row full of forest trees, and looking down on the windings of the Maran, and every now and then obtaining glimpses of the spire, embosomed in lofty elms. The park abounds in game; and the pheasants, which appear to be of all hues, are met with at every step; very tame, and enjoying to the utmost their sweet liberty.

The garden nearest the house is called the winter-garden, and is laid out in a fantastic manner. There are beds of various forms; some, in shape, heraldic, each of which contains some coloured substance,—coals, red brick, etc., and is bordered with box, in the usual way. The effect is, probably, more singular than pleasing. The American shrubs, interspersed in borders on the grass beyond with the tazas, vases, etc., are much more tasteful, and suggestive of many sweet summer mornings in my lady's pleasure. The other side of the mansion has its Italian garden, and a dairy abounding in antique china. Beyond this, in a mossy declivity, the giant oak rears its majestic limbs. At first sight not realising the full extent of its dimensions, or its grandeur, but gradually, as the eye gets accustomed to its vastness, to the solidity of its trunk, to the healthy aspect it bears, to its wide-spreading branches—many being fully as large as the main body of an ordinary tree—due appreciation of its renown is sure to follow. Through many a new-world wilderness, or carefully-tended plantation, may man's curiosity lead him; but surely he will never stay to shelter from summer's sun, or autumn shower, beneath a loftier or more noble specimen of the forest tribe. Looking as if it had long ago defied all time, it is still vigorous enough to brave the pitiless storm for an hundred years to come. It would be an improvement if the surrounding brushwood and growing trees were diverted from their increasing proximity. At present they form too dense and close a background, visibly interfering with the light and shade that should fall around, in uninterrupted harmony.

The house is a modern edifice, half Gothic, castellated, with nothing particular in its exterior to call for any eulogium; but within most conveniently and comfortably arranged. Nothing sacrificed to grandeur or show, but all disposed in elegant order, and indicative of a tasteful owner. The Library is rich in the possession of a large painting by Vandyke. Like the large spread canvass at Wilton, it is a family group. The Count John of Nassau, his countess, and children, confront the spectator, as if they were on the eve of addressing him. This picture is in the best preservation. There are the usual suite of rooms, ending in a small boudoir, whose walls are hung with miniatures and portraits of

various members of the noble houses of Cowper and De Grey. A head, by Willeborts, Lord Bacon, by Vansomer and a trio of the Lamb family, from the pencil of the classical Sir Joshua, are especially to be commended. Nor is the poet overlooked, being here portrayed in a pose fraught with melancholy meaning. Hoppner's portrait of the present Viscountess Palmerston is graceful and striking. A head, said to be by Lely, is life-like and real.

The late earl, by Lawrence, is in the artist's usual style. Venice has its painter in Canaletti, whose brush must have been dipped in one of its lagoons, so cool the water, and so stately and sharp the piazzas and columns. A curious musical party, by Zoffany, hangs near, and recalls the days of hoops and ruffles, and "the nice conduct of a clouded cane." To pass from all these, however, and to enter the sanctum of the house, will require small effort. The Picture Gallery is admirably adapted for its uses, is lighted from above, and is conveniently fitted up with all sorts of settees, chairs, luxurious appliances, for the quiet enjoyment of the glorious creations of art adorning the apartment. The principal and the most captivating of the entire collection is the "Holy Family," by Fra Bartolomeo. The wonderful repose which characterizes this production, is only equalled by the high religious sentiment which pervades every part of it. Not the least striking merit is the extreme vividness of the colouring, so charmingly modulated and toned down. The face of the Virgin is full of sweet expression, and is regarding the Child in her lap with a half-consciousness of the Divine sufferings.

The background is appropriate to the subject, and helps, with the able management of the shadows, to give an artistic completion to the whole. This master is almost unknown in this country, and indeed has few evidences of his skill out of Italy. It is to his former profession of monk, that we are indebted doubtless to that absence of all mere worldly excellencies in his pictures where sacred subjects are introduced, producing thereby a solemn devotional effect.

The transition from this beautiful gem to its neighbour, a "Madonna and Child," by Raffaele, is easy. The Virgin is beaming with heavenly grace, and the Child seems rapt in the plenitude of enjoyment. This is one of the finest works of the master in this country. It has been noticed by Waagen in terms of the highest possible eulogium. There is a softness and delicacy about the entire composition, that positively makes an adjoining head of Correggio's look coarse and feeble in comparison. To understand the full meaning of that Italian expression, "the Divine Raffaele," this picture should be seen, studied, and ineffaceably remembered. The latter will be attended with no difficulty to those whose admiration of art leads them to seek its highest beauties at the shrines of its chief priests. Close to this Madonna is the portrait of a "Young Student," by Andrea del Sarto; something very powerful in the expression, a manliness in the bearing, and a total absence of all meretricious ornament, will take the visitor again and again to this picture. On the other side of the central painting, hang two more portraits by the same artist, one of himself; he is in the act of looking up from the perusal of a letter, which has conveyed no pleasant tidings to the reader, if the sorrowful face is to tell its tale. The other portrait is of a lady, who might be taken as a model for Cleopatra. Neither of these are so admirable as the student; the simplicity and refinement there exhibited, certainly excel them.

These five paintings are the focus of attraction for all eyes artistical. Not to confine our attention to these only, words of high praise are demanded for another example of Raffaele's best style. Equally lovely is the face of this Madonna, equally perfect in point of grace, to the one before mentioned.

The attitude of the Child, who is seen caressing his Mother, contrasts excellently with the placid quietude

of the Virgin, who looks as if she combined all of meek motherly gentleness with a dignified sense of her glorious possession. Salvator Rosa claims notice in right of a woody ravine, which looms in mysterious blackness in a corner by itself. There is too a sea-piece of his, with mountains, and fishermen, as lastly disposed as the aspect of the air can make them. Carlo Dolce is in full force; the Nativity being a clear and comprehensive composition, full of truth and vigour. The portrait of his wife will arrest the spectator by its earnest expression.

Correggio's head of "Christ crowned with thorns," though a fine painting, is seen to every disadvantage when so near to the chef d'œuvre of the collection. It is kept in a glass case with a small silk curtain before it. "The Return of the Prodigal Son," by Guercino, is deservedly praised by all connoisseurs, for the boldness of the drawing; and the same meed of praise may be allotted to Vandyke's unfinished sketch of the "Rape of the Sabines." In this, he seems to have followed closely the manner of his master. In the disposition of many of the female figures, it is very obvious, and the grouping of the scenes of violence will bring Rubens forcibly to remembrance. There is a Cupid, which has been fathered upon as many masters, as the urchin had arrows in his quiver. Why Annibale Caracci should be selected is difficult to say! It does not possess any of the ordinary attributes of that distinguished man; on the contrary, it bears many evidences of the most opposite qualities to his. The representation of Marshal Turenne on a horse, whose impatience to proceed is strikingly manifest, fills a large space of the wall opposite the bay window, which constitutes the end of the gallery. It is by Rembrandt, and in his boldest manner. The shadows are wrought as he only could treat him. It is a fine picture, and fills its post of honour appropriately and well.

On each side is a pedestal, bearing a bust of two juvenile branches of the family. There are two tables of mosaic work, with landscapes, of the highest state of finish; these bijoux are Italian. But distracted or disturbed from the real beauties of this spot, no true artist, or poet, ever can or will be. Again and again will the "Holy Family" of Fra Bartolomeo, and the Madonnas of Raffaele, appeal for more attention, and well will they pass the ordeal of repeated inspections, each time revealing fresh aims of the grandest artistic finish. Amid the trials and toils of this world of activities, it is a privilege to snatch a few hours of quiet, and enjoy the repose, the sense of all-refreshing rest, that the view of these paintings affords. In no other gallery is so much to be met with, typical of rest. The solitude of the mansion, the beautiful stillness of the woods and lawns outside, unbroken by any fountain's fall or voice of speaking Time, add greatly to the profound impression of repose within.

There is a great comfort attached to the place, and worthy to be noted as a pattern for all the possessors of pictorial value. The visitor is not hurried at a remorseless rate through and past the rooms and gallery; but is allowed to take his own leisure, and behold the treasures calmly, and without fear of interruption. The value of thus witnessing the paintings is enhanced threefold, and enables the memory to digest, as it were, at its own opportunities, all that it has stored up of the beautiful and the sublime. It is difficult indeed to take leave of Panshanger, where Nature and Art go so charmingly in unison; and where so great an amount of liberty and concession is so freely granted.

To those who can afford the time, or who are not travelling by the railroad, having too a horse or carriage of any description for their accommodation, it is recommended to take a ride through the domain; astounding as it does in picturesque forest views, there is much to enjoy. In June, the foliage of the oaks is here intensely green, and the murmurings of the streams, "fretted with their frothy foam," inausibly recall memories of

Creswick, the draughtsman of Nature's "greenest wastes"—subjects for his pencil lie on either hand. The extremity of the park is ornamented with two sensible looking lodges, and the Essendon road is speedily attained. From thence the way to the Hatfield and London road is through lanes redolent of beauty; hedges laden with the wild rose, blooming in graceful festoons, cottages of very trim and orderly aspect, greet the eye, suggesting thoughts of the regular lives of their inhabitants. The nightingale too is in high repute in this part of Hertfordshire, and may be heard singing the summer day through, as if its music were the voice of the Spirit of the villages, hymning their praises, and attesting, in its sweet and mellifluous cadences, "the pleasures of the plains."

Few persons disposed to linger in the footsteps of the ideal, and pass from one of Nature's noblest creations—the mighty oak—to the works of men, glorious masters in their calling, and realising all that men's power and capacity can afford them, will find their day's pleasure wearisome, if that day be spent in and about Panahanger.

Not to lose sight altogether of creature consolations, the White Horse at Hertingfordbury may be conscientiously recommended, where they may take their ease in an inn, whose landlord and landlady are obliging, civil, and moderate in their demands.

NUREMBERG.¹

THE windows of the church are adorned with the arms of various noble families of the city, who were patrons of the edifice—a decoration very characteristic of Nuremberg, than which there is no town the citizens of which had a deeper or more enthusiastic love of their birthplace (another point of resemblance, by the way, to Venice): nothing gave them higher delight than in some way to amalgamate themselves with the being of their city, and Nuremberg was in all respects the best and the most inimitable of all towns. This feeling still exists: every Nuremberger is an optimist so far as his own town is concerned, and the affection he bears it is unbounded. I had a curious instance of this in a girl whom I met in the north of Germany, and who, though she had been absent from her native town but a few months, almost went into hysterics with delight, on finding that we had but lately been in Nuremberg, and could discuss its beauties with her. The best example of this sentiment, however, is the legend which is related here of the pillars of the castle chapel, and which I may tell you as we walk home towards your hotel, which by my advice should be the "Red Horse." It is not the crack inn of the place; and, had I been guided by Murray alone, I should have gone to another, the name of which I forget, but that we luckily heard that a royal personage was staying there. Now, there is but one person for whom I feel greater respect than towards the royalty of England, and that person is myself. This respect led me most carefully to eschew a hotel favoured by any such exalted individual, and I repaired to the "Red Horse," which I can safely recommend as one of the most comfortable inns in Germany, and that is no small praise. But to our story.

Little Father Gregory, the officiating curate of the castle chapel, was a man in whom the peculiarity of the Nuremberg mind which I have alluded to was developed to its fullest extent. His forefathers had for centuries been enrolled amongst the burghers of that city; he himself had been born and bred in it, and his faith in its perfection was unbounded. He believed it to be the cream of all the towns of Europe; whatever was in it was perfect in its kind, and no other place possessed

what Nuremberg had not. It was even said that he carried this opinion to the length of heresy, and believed either that a citizen of Nuremberg could do no wrong, or, at any rate, that his position as such would save him from the condign punishment awarded to inferior mortals; like the French lady under the old régime, who, when a preacher was endeavouring to warn his congregation by reflections on the recent death of a libertine nobleman of very old family, exclaimed, with a dissenting shake of the head, "Ah! depend upon it, God Almighty thinks twice before he dooms a man of such high quality." With these opinions of the unparalleled merits of his own city, it may easily be imagined that the good father frequently got himself into a scrape, when arguing with those who had seen more of the world than himself: the honest monk, having never been a traveller, could only oppose his own assertions to the arguments of strangers; and, though generally favoured with a most partial audience, was very often beaten on his own ground. These defeats, however, only served to root Father Gregory the more firmly in his opinion, so that it at length became a perfect idiosyncrasy with him, and he would sooner have laid down his life than have allowed the inferiority of Nuremberg in any one point, however insignificant. With such sentiments, it may be believed that the curate was not a little annoyed at meeting, one evening, in a village a short distance from the town, a stranger merchant, who announced himself to have recently arrived from Rome, and would by no means concede such unqualified admiration.

"I grant," said he, taking a huge sip of beer, "that your city is a pretty and thriving place enough, and that you brew very good beer; but I have tasted as good liquor elsewhere, and I have seen cities to which this is not to be compared in regard of magnificence of building and extent."

"What cities may you speak of?" replied the monk, drumming on the table with an air of determination not to be satisfied—"what cities, good friend?"

"Nay, then," answered the stranger, "I could name several; but I will give only one—Rome, for instance."

"Rome!" exclaimed Father Gregory, with an expression of disdain: "I do not talk of ruins, but of existing edifices. Some thousand years ago, Rome might have been matched with Nuremberg, but not now."

"Good, now," returned the other, "we will leave the ruins out of the question, although, methinks, you give me but hard measure in requiring that of me; but we will take the newer buildings. What say you to the grand cathedral of St. Peter?"

"We have no cathedral here," returned the monk, "because we have no bishop. Whether in that respect Rome may claim an advantage over us or no, I shall leave it to yourself to decide. But for churches and chapels, we have those may match with any in the imperial city."

"There, now, I cannot agree with you, good father," answered the other. "I leave for the north in an hour, and I was in your town this very day, and have seen most of the finer edifices with which it is adorned. Amongst others I saw your own little chapel, which I dare swear is a neat, old fashioned thing enough; but I saw one, the very model of it, at Rome, which has the advantage over yours."

"In what point, if I may ask?" said the monk drily.

"It requires the four pillars which are in the chapel at Rome," replied his antagonist.

"Pillars!" returned the monk; "you must have had but sorry eyes, if you saw them not in our chapel as well as at Rome."

The stranger stared.

"Do you affirm," said he, "that there are such to be seen in the castle chapel?"

"Of a verity I do so," returned Father Gregory, pertinaciously, whilst the gestures of those around him

(1) Concluded from page 264.

showed their astonishment at his folly, in thus asserting what they knew to be a falsehood.

"Well, then," exclaimed the stranger, rising, "the matter will be easily determined. I had intended to have pursued my journey hence without returning to your city, but since this question has arisen, I will even conclude some business which will detain me here an hour or two, and then proceed straight to the chapel, so that it shall at once be seen whether I am wrong, or whether this assertion of yours be not the offspring of that self-conceit, for which you citizens of Nuremberg are so notorious."

So saying, he departed, leaving the good father in no very enviable state of mind; his companions crowded around, consoling him, as is usual on such occasions, by showing him the extreme folly of which he had been guilty; whilst, to all their arguments, the poor monk could only reply by groans and asseverations, that he had but done his best to maintain the honour of his native town, since he had understood from the beginning that the stranger was not to be in Nuremberg again. Recrimination and repentance, however, were now of no avail, and Father Gregory, who was in no mood for company, set out on his solitary walk to the city. On the road he turned over in his mind all the possible and impossible modes of preventing the dire disgrace which would fall on his beloved Nuremberg, when the insolent traveller should discover his triumph. At times he even thought of waylaying the stranger, and assassinating him; again of burning down the chapel, ere he arrived to see the want of pillars. He called every saint in the calendar to his assistance, and finally, in the bitterness of his soul, exclaimed, that were the devil to proffer him aid, he would accept of it rather than the honour of Nuremberg should be tarnished. Help from the latter quarter was nearer than Father Gregory deemed, when this assertion escaped his lips. As he approached the heathen tower of the castle, on his way to the chapel which was the source of all his tribulation, the monk perceived a figure seated beneath one of the rude figures from which the tower derives its name, and its incontrovertible reputation of being haunted. As he passed, the figure arose, and a tall and very gentlemanly looking man in black, addressed the monk most courteously by name. "You wished for my assistance," said he, "in this little difficulty which you have fallen into, and I shall be most happy to accommodate you."

"I beg your pardon," replied the astonished monk, "I do not quite understand you."

"Pooh, pooh!" returned the other, "I wonder that you should be so slow of apprehension. It was but this moment you were saying, that were I to offer to extricate you from this dilemma, with regard to the pillars, or rather the no pillars of the chapel, you would accept of my aid. Now I both can, and will assist you, for not only shall the chapel be furnished with pillars, but I will fetch for that purpose the identical pillars from Rome, which were the origin of your dispute."

"I am to understand, then," said Gregory, "that you are —?"

"Exactly so," interrupted his new acquaintance, with a graceful wave of the hand, "exactly so; amongst friends there is no necessity for naming names."

The monk was silent for a while. He was neither so much surprised nor terrified as might have been expected, for visits from the angels of darkness were in those days, if we may credit history, not nearly so few and far between as from the inhabitants of a higher sphere; and besides, being a priest, it was all in the way of his profession. Still he paused, not so much to consider whether he should accept the offer, for that in his desperate circumstances he had already determined on, but to reflect on the means of driving the best bargain for himself.

"In case I were to incline to deal with you," said he, at length, "the price of your services would, I suppose, be the same that you usually demand?"

"Certainly!" was the reply, "no other terms can be listened to. Agree to the little transference which I invariably adhere to, and the pillars shall be brought from Rome at once."

"But," persisted the monk, "this plaguy traveller, whom may the saints confound!" his friend winced a little, "will be here immediately; now it is a long way to Rome, and these pillars will be a heavy weight; are you sure that you will be able to bring them here in time?"

"Make your mind easy on that score," returned the other, "the pillars shall be here before you can say a score of litanies, read as fast as you choose, or the bargain shall be no bargain."

"Say you so?" cried the father, eagerly, who being noted for a fast reader, saw in this proposal an opening for escape on his own part, as well as for triumph over the traveller; "then I agree to your terms. Bring the pillars from Rome, ere I can say a score of litanies, and I shall not grumble at your terms."

"Agreed!" cried the gentleman in black, and vanished, as did the monk—the one to Rome, and the other to his chapel to commence his litanies. The devil flew straight to his destination, rested a minute or two to take breath, and then neatly unpacking the pillars, set out on his return to Nuremberg. Meanwhile the monk, now that he had time to reflect on the terms of his bargain, felt anything but comfortable. In a moment of anxiety, and even despair, he had no doubt ratified the contract, but the more he thought of his conduct, the more he repented of his rashness. Rome no doubt was a long way off, and the time allowed to his sable friend was, comparatively speaking, a very short one; but the monk well knew both the surprising powers, and the caution of him with whom he had bargained, and reflecting on the confidence with which he had mentioned the time for the accomplishment of his task, felt that he would never have agreed to it, had he not been certain that it would suffice. These considerations, so far from expediting poor Father Gregory in his litanies, impeded him, for so great was his terror and anxiety, that each sentence, as he stumbled it over, cost him thrice the time it would have required under other circumstances: he stammered, he mistook, repeated unnecessarily, and grew worse and worse, till at length he came to a dead stop, from sheer inability to articulate. At this moment casting a look through the open door of the chapel, he heard a loud rustling sound, and perceived his friend, who, with a grin of satisfaction, was easing his shoulders of the weight of the pillars. The monk was paralysed; his knees shook under him; and he all but fell to the ground;—his own task was not half accomplished, and yet here were the pillars already brought from Rome, and only requiring to be stationed in the chapel. Father Gregory was in despair, and was about to yield himself up to his fate, when a bright thought suddenly struck him. He knew the potency with many persons of a thumping falsehood; and if it be right in the general case to tell truth and shame the devil, he felt that there could be no harm in the present, in telling one to confound the father of lies himself. Snapping his fingers, therefore, with an air of triumph, he rushed out of the chapel, exclaiming, "I have won,—won hollow!"

"How!" inquired his friend, in no small astonishment, "what mean you by this turbulent joy?"

"In good sooth," returned the monk, "simply that I have triumphed! for you have yet to fasten me up these pillars, and I have finished my part of our contract."

"How!" exclaimed the other, "have you finished?"

"Sure enough!" returned Gregory, "the last litany is just at an end: so be quick, I pray you, and conclude your work."

"That," cried the baffled demon, "you may do for yourself, and thank me for having been fool enough to help you half way!" and so saying, he disappeared, with a yell of rage.

The little monk chuckled, and rubbed his hands with delight, and then, to make all sure, retreated again into the chapel, and finished his litanies; thus actually fulfilling his share of the contract first, inasmuch as the pillars had not been set up. They were put up, however, by the monk in a day or two, but the traveller never came to see them, and, indeed, never was heard of more; and the general opinion was, that he was no mortal traveller, but the devil himself, who had assumed this shape with a deep-laid design of tarnishing the honour of Nuremberg, and kidnapping Father Gregory, by means of his well-known foible, in both of which projects he was foiled by the address of the good monk.

Such is the tale of the pillars in the castle chapel, very much as related by our guide. I give it as a specimen of the innumerable legends connected with Nuremberg, over the greater number of which it has this advantage, that there can be no doubt of its truth; for if you require proof before believing, there are the pillars themselves, and what better evidence can you have.

No one should leave Nuremberg without visiting the Rosenau, which is the principal beer and tea garden of the town. It is a great improvement on the usual pleasure gardens of Germany, which in general are anything but distinguished for beauty; whilst the Rosenau is a very pretty little spot, neatly laid out with trees and flowering shrubs, and adorned with a Chinese pavilion, glittering in all the glories of tinsel and bright paint, which the citizens look on as a triumph of picturesque art; but its principal attraction to the tourist is that, in the company to be found there, you see not only the burghers of the present day, but the identical beings who flourished in their stead some centuries back. For in Nuremberg, as I hinted before, it is not only the houses which retain their ancient character, although many of these have been for hundreds of years devoted to the same purposes, (as, for instance, that of Behaim, the chart-maker and navigator, who claims the honour of having discovered America, which house is still a chart manufactory; so that if a Nuremberg Rip van Winkle were to arise, he would have no difficulty in recognising his old haunts,) but the people themselves are unchanged. Many of them reside in the same houses which have been occupied by their families from time immemorial, and follow the same trades as their forefathers in the sixteenth century. Here, in the Rosenau, you have the best opportunity of seeing these original personages collectively, and an interesting sight it is; they converse, and drink, and smoke, with a most characteristic gravity, and their whole appearance and demeanour is as old-fashioned as you would wish: there are staid sober-looking fathers of families, of portly and agreeable mien; smooth, simple-looking young men, and uncommonly pleasant matrons, smiling and tidy; the very children have an air of correctness, which one seldom sees; and the young ladies, sly and coquettish as they are, have a look of simple ingenuousness which renders them ten times more attractive. The amusements are much the same as are to be found in all German gardens; that is to say, the company listen to a band of thumping music, whilst the men smoke, and drink beer, and the women coffee deluged with milk, and sweetened to syrup. In addition to these exhilarating entertainments, there is the still more exciting diversion of paddling about in small punts in the greasy water which surrounds the garden. This appears to be considered a peculiarly delightful recreation,—persons of all ages and sexes engage in it; and I particularly remarked one smart and smiling young lady, who was evidently proud of her dexterity at the paddle, and who glanced at us with *water coquetry*, as she rowed along a young man, evidently a favoured swimmer, in their little tub. Indeed to persons of whom not one in ten thousand has seen the sea, nor one in a thousand a river larger than the Pegnitz, this navigation must appear quite hazardous enough to be delightful. After all, that

which especially pleased me in the company in the Rosenau, as, indeed, in all Nuremberg, is this primitive simplicity of mind and demeanour which pervades the whole. You will say this is the general characteristic of Germany; but the peculiar charm of Nuremberg is, that this spirit is developed heres much more thoroughly than anywhere else. The Rosenau, however, is the resort of the aristocracy only, but if you wander about the town of an evening, you will find many a retreat for pleasure, of a humbler, but equally interesting character;—there are little *al fresco* taverns situated in green arbours, adorned with variegated lamps, and redolent of cheese and sausages; above all there is one most picturesque spot, the name of which I forget, a little green grove by the water side, where booths are pitched for the cooking and vending of mysterious viands, of a coarse, but most savoury nature. In all of them reigns the same spirit of unpretending comfort and decent enjoyment. Talking of these evening amusements, I would advise every one who has the opportunity, to see Nuremberg by night as well as by day; every city should be so seen,—but this one, the principal feature of which is its antiquity, more than any other. On the last night of our stay there, we walked through at a late hour. There was a bright moonlight, and the scene was peculiarly impressive—whether gazing on the worn-out rampart, where the crumbling walls are overhung with creepers, and the massive towers cast gigantic shadows of inky darkness across the deep fosse, or glancing up at the lofty graceful spires of the noble churches, looking down from the silent bridges into the black waters of the Pegnitz, or straying amongst the tall spectral houses, the effect is entirely distinct from, and superior to that of the same objects seen in daylight, amidst the busy traffic of men; there is a congeniality between the place and the hour and atmosphere. The town, unlike our modern cities, is perfectly still; and, as you roam about in that wizard light through the ghostly streets, the full impress of their antiquity comes upon you, and you feel yourself transported to another and unknown age.

And now, reader, we have had enough of Nuremberg. I have not attempted any regular description of it, because it is exactly one of those places of which it is impossible to give a satisfactory description. I have merely attempted to give an idea of the feelings produced in my own mind by my visit to this, to me one of the most interesting of German towns. But it is a place which must be seen to be understood; and to every one who wishes to know what the German burgher life was in olden times, and to view, perhaps, the most uncontaminated German life of the present day, I would say, go to Nuremberg: it is luckily out of the general route of sight-seers, and has, therefore, retained far more of its original simplicity than other cities, with not half the same attractions; but the day will soon come, when its citizens will value their curiosities, not from an honest pride in their excellence, but for the money they will bring, and then the real attraction of their town, the inward spirit of primitiveness, which vivifies the outward aspect of its antiquity, will have departed.

The Butler's Fright on Halloween.

FROM A DRAWING IN THE MANCHESTER EXHIBITION, BY W. D. SCOTT, ESQ.

THE FASCINATING POWER OF SERPENTS.

In the infancy of science the simplicity of truth was warped by superstition, and imagination frequently supplied that which observation failed to detect. From the time of Bacon it has been quite as much the business of philosophy to eradicate error as to enlarge the boundaries of knowledge, and, although the garden of science is becoming every year more and more flourishing and fair, it is still disfigured by many weeds which the multitude esteem as healthful plants. The belief in omens, in weather prognostics, in the preternatural attributes of certain animals, still forms part of the intellectual creed of many educated persons; they have aversions and antipathies which they are not ashamed to own, and they turn with dread or disgust from some of the most interesting of God's creatures.

It is this very dread or disgust which has caused the mind to invest certain animals with attributes which do not belong to them. Thus it has long been supposed that the serpent possesses the power of fascinating its prey, of exciting a certain magical influence, which renders it impossible for the animal to escape when once the reptile has fixed its eyes upon it.

This superstition, for such we must call it, has been adopted by many distinguished naturalists, who hold as it were the book of nature in their hands; by men of learning and genius; by classical scholars grown old in the disbelief of similar fables, heightened and embellished by the charms of poetry; and by the common people in general. In the rural districts of America there is scarcely a man or woman that will not relate some wonderful story as a proof of this fascinating power; they teach their children to believe it, and thus it forms one of the earliest prejudices of the infant mind.

It is remarkable that among the many superstitions attached by the ancients to the actions of animals the reputed fascinating power of serpents should not have occurred to them. It is said to have originated among the North American Indians; this, however, is doubtful, for they only speak of the great ingenuity of the serpent in catching birds, squirrels, &c. A Mohican Indian told Dr. Barton that his countrymen entertained the opinion that the rattle-snake had the power to charm or bewitch squirrels and birds, and that it did so with its rattle, which it shook, thereby inviting the animals to descend from the trees, when they became an easy conquest. A Choctah Indian bore a similar testimony as to the fascinating power of the rattle-snake, but knew nothing respecting the means employed.

Linnaeus in his *Systema Nature* gives credit to this fascinating power of serpents. He says—"Whoever is wounded by the hooded serpent expires in a few minutes; nor can he escape with life who is bitten by the rattle-snake in any part near a great vein. But the merciful God has distinguished these pests by peculiar signs, and has created them most inveterate enemies; for, as he has appointed cats to destroy mice, so has he provided the ichneumon against the former serpent, and the hog to persecute the latter. He has, moreover, given the crocalus a very slow motion, and has annexed a kind of rattle to its tail, by the motion of which it gives notice of its approach; but, lest this slowness should be too great a disadvantage to the animal itself, he has favoured it with a certain power of fascinating squirrels from high trees, and birds from the air into its throat, in the same manner as flies are precipitated into the jaws of the lazy toad."

Linnaeus received his account from some of his many pupils travelling in different parts of the world, probably from Kalm, in whose *Travels in North America* the following details on the subject are given:—

"The snake, whatever its species may be, lying at the bottom of the tree or bush upon which the bird or squirrel sits, fixes its eyes upon the animal which it designs to fascinate or enchant. No sooner is this done

than the unhappy animal is unable to escape. It utters a piteous cry; and, if it is a squirrel, runs up the tree for a short distance, comes down again, then runs up, and lastly comes lower down again. On that occasion," says the Professor, "it has been observed that the squirrel always goes down more than it goes up. The snake still continues at the root of the tree, with its eyes fixed on the squirrel, with which its attention is so entirely taken up that a person accidentally approaching may make a considerable noise without the snake's so much as turning about. The squirrel, as before mentioned, comes always lower, and at last leaps down to the snake, whose mouth is already wide open for its reception. The poor little animal then, with a piteous cry, runs into the snake's jaws, and is swallowed at once, if it be not too big; but, if its size will not allow it to be swallowed at once, the snake licks it several times with its tongue, and smoothes it, and by that means makes it fit for swallowing."

The celebrated comparative anatomist, Blumenbach, also admits, "that squirrels, small birds, &c., voluntarily falling from trees into the jaws of the rattle-snake lying under them, is certainly founded in fact; nor is this much to be wondered at, as similar phenomena have been observed in other species of serpents, and even in toads, hawks, and in cats, all of which to appearance can, under particular circumstances, entice other small animals by more stealthy looks. Thus the rattles of this snake are of peculiar service; for their hissing noise causes the squirrels, whether impelled by a kind of curiosity, misunderstanding, or dreadful fear, to follow it, as it would seem, of their own accord. At least I know from well informed eye-witnesses that it is one of the common practices among the younger savages to hide themselves in the woods, and by counterfeiting the hissing of the rattle-snake to allure and catch the squirrels."

Mr. Barker, in his *Travels in North and South Carolina*, speaking of rattle-snakes, says:—

"They are supposed to have the power of fascination in an eminent degree, so as to enthrall their prey. It is generally believed that they charm birds, rabbits, squirrels, and other animals, and by steadfastly looking at them, possess them with infatuation: be the cause what it may, the miserable creatures undoubtedly strive by every possible means to escape, but alas! their endeavours are in vain, they at last lose the power of resistance, and flatter or move slowly, but reluctantly, towards the yawning jaws of their devourers, and creep into their mouths, or lie down and suffer themselves to be taken and swallowed."

In considering the value of these, and many similar statements which might be cited, it is important to remark that not one of the writers speaks on his own personal testimony. Kalm even admits that he never saw an instance of fascination, but he gives a list of more than twenty persons, "among whom are some of the most creditable people, who have all unanimously, though living far distant from each other, asserted the same thing."

A distinguished scientific writer on serpents, M. de la Cépède, assuming the description of Kalm to be founded in truth, thinks it probable that when an animal has been seen to precipitate itself from the top of a tree into the jaws of a rattle-snake, it has been already bitten; that, after escaping, it manifested by its cries and agitation the violent action of the poison left in its blood, and diffused by the envenomed inoculation of the reptile's tooth; that, its strength gradually decaying, it would fly or leap from branch to branch, till, finally, exhausted, it would fall before the serpent, which, with inflamed eyes and eager looks, would watch attentively every motion, and then dart on his prey when it retained but a small portion of life.

Other writers who are not disposed to admit the fascinating power of the serpent's eyes, adopt the opinion, which was formerly not uncommon, that serpents have the power of diffusing an infectious odour around them,

capable of stupifying small animals, and preventing their escape. On this subject there is much difference of opinion, for, while some contend that serpents have absolutely no odour at all, others contend that they give out a most offensive odour from every part of the body, similar to that of flesh in the last stage of putrefaction, and extending to a considerable distance. It has also been said that horses are sensible of, and greatly agitated by, this odour at the distance of forty or fifty yards from the place where the snake is concealed, and show their abhorrence by snorting and starting from the road, endeavouring to throw their riders in order to make their escape.

In Dr. Barton's memoir on the fascinating power of serpents, published in the Transactions of the American Philosophical Society, the experiments of Vosmaer are quoted; several birds and mice were thrown into a cage where a rattle-snake was confined; the little animals immediately endeavoured to squat in a corner, and soon after, as if seized with deadly anguish, ran towards their enemy, who continually shook his rattles.

Any one looking at this experiment with his mind preoccupied with the theory of fascination, would say that the little animals were fascinated by the serpent; others, who had no particular theory to advocate, would say they were impelled by the strong instinct of fear, first to secrete themselves in corners, and finding these unsafe, would run or fly across the cage in search of a more secure retreat, when they would fall victims to their enemy. So necessary is it, in order to observe facts properly, to keep the mind free from prejudice. Dr. Barton well observes, "Perhaps facts are never related in all their unadulterated purity except by those who, intent upon the discovery of truth, keep system at a distance, regardless of its claims. The strong democracy of facts should exert its wholesome sway."

Experiments similar to those of Vosmaer have been made with different results. Birds put into a cage with a rattle-snake, flew or ran from the reptile as though sensible of their danger. The snake made many attempts to catch them but seldom succeeded. When a dead bird was thrown in he devoured it immediately. He also soon caught and devoured a living mole, an animal much more sluggish than the bird. Dr. Barton confined during several hours a small snow-bird with a large rattle-snake. It exhibited no signs of fear, but hopped about from the door of the cage to its perch, and frequently hopped about on the snake's back. Its chirp was in no way tremulous, but perfectly natural, and it ate the seed put in for it. The snake, it is true, was languid, and had not eaten for a long time, and it was somewhat early in the season for snakes. This experiment proves at least the absence of any mephitic vapour; indeed, if such existed, the natural haunts of serpents would be fatal to other animals which frequent them, such as frogs and many species of birds. The rattle-snake is often known to lurk for days together at the bottom of a tree, or near a small bush, upon the branches of which the thrush or the cat-bird are rearing their young. Birds of the eagle and hawk kind will hover over the spot, and at length dart down upon the reptile, and carry it off to their young. If the animal had the power of generating any mephitic vapour, it would surely do so for its own protection in such a case as this. Persons who have kept rattle-snakes in confinement for months at a time have been quite unable to detect any odour in them.

Some writers suppose the instrument of fascination in the rattlesnake to be the crepitaculum, or set of bells,¹ which the animal rings at dinner-time, and then its prey comes running towards the reptile, as if to say, "eat me!" "eat me!" It is unfortunate for this theory, that most writers state, that the rattle-snake in the supposed act of charming keeps its rattles perfectly still. There

also seems to be some mistake about Blumenbach's statement, that an imitation of the hissing of serpents will lure rabbits, &c. to their destruction. Those best acquainted with the habits of the Indians know nothing of this practice; but they speak of one, which is likely to have originated the idea. The young Indians put arrows across their mouths, and by the quivering motion of their lips, imitate the noise of young birds, thus bringing the old ones near them, so that they can be readily shot at. In like manner the great sharks, lolling in a thicket, and imitating the cry of a young bird, often succeeds in seizing the old ones, which have been solicited by the counterfeited noise to the assistance of their young. It is also said that the titmouse will make a noise, by night, at the entrance of the bee hive; and when a bee comes out to see what is the matter, will seize and devour it. In this way he will secure a dozen in succession.

In endeavouring to trace to its source the origin of this supposed mysterious power in serpents, Dr. Barton was led to inquire, 1. What species of birds are most frequently observed to be enchanted by serpents; and, 2. At what season of the year has any particular species been most commonly seen under this wonderful influence?

Some birds build on the summits of lofty trees; others hang their nests from the extremity of a branch, or even on a leaf; others on the lower branches, among bushes, and in the hollows of decayed and other trees. Some species build on the ground, in cavities in stones, or holes in the earth, among the grass of fields and meadows, in fields of wheat, &c. Now, of all these varieties, those most liable to the attacks of serpents are ground nests, and nests built on the lower branches of trees and on low bushes, especially on the sides of rivers, creeks, and other waters, that are frequented by different kinds of serpents; and, on opening the stomachs of serpents, birds which build in the manner just mentioned are most frequently found in them.

The rattle-snake seldom or never climbs trees; it is found about their roots in wet situations. Upon the lower branches of such a tree, it is very likely a bird or squirrel may have been seen exhibiting symptoms of fear and distress. Is this a matter of wonder? Nature has taught different animals what are their enemies; and, although the principal food of the rattle-snake is the peat frog, yet, as he occasionally devours birds and squirrels, he is to these animals an object of fear. That the terrified creature will sometimes run towards the serpent, then retire and return again, is not denied; but that it is irresistibly drawn into the jaws of the serpent is denied. On the contrary, it is not uncommon for a bird to attack a serpent and chase it away, in doing which, it may get a fatal bite from its enemy. The black snake, whose bite is harmless, has the power of climbing trees, and feasts on the eggs and young of birds. Audubon has given a vivid description of a Baltimore oriole attacking the black snake, which sought to plunder her nest.

In general, serpents attack birds at the seasons of incubation, and of hatching and rearing the young brood, while the latter are defenceless. The cries and fears of birds, supposed to be under the influence of fascination, are but a strong expression of maternal solicitude for their young. So also, when the parent bird is teaching her young to fly, there is great danger from the attacks of serpents. Their flights are awkward and broken by fatigue, and falling to the ground, they often become victims to their lurking enemy. The mother, attempting to save them, will dart upon the serpent, but fear compels her to retire; she returns again, attacks him with wing and beak and claws. Should the serpent succeed in capturing the young, the mother is in less danger, for while engaged in swallowing them, the serpent has no power to seize the old bird; but the appetite of the serpent tribe being great, and the capacity of the stomach not less so, the snake having devoured the young, attempts to seize the parent bird, and in doing

(1) *Serpent à sonnette* is the French term for rattlesnake.

so completes the catastrophe, which crowns the tale of fascination.

An anecdote, related by Mr. Rittenhouse, will further illustrate this view of the subject. This gentleman, walking out in the country, had his attention excited by the peculiar melancholy cry of the swamp black-bird, which led him to suppose that a snake was near, and that the bird was in distress. He threw a stone at the place from whence the cry proceeded, which had the effect of driving the bird away. The poor animal, however, immediately returned to the same spot. Mr. R. now went to the place where the bird alighted, and to his great astonishment, he found it perched upon the back of a large black snake, and pecking it with its beak. The serpent was in the act of swallowing a young bird; and from the enlarged size of the reptile's belly, it was evident that it had already swallowed two or three other young birds. After the snake was killed, the old bird flew away.

These, and similar instances by careful observers, illustrate the method adopted by these reptiles in procuring food, and indeed they often find it very difficult to do so. The rattle-snake lies insidiously in wait for his prey at the water's edge, employing no machinery of enchantment, but trusting entirely to his cunning and his strength. The black snake, which is much more active than the rattle-snake, will ascend the loftiest trees in search of its prey. If gifted with the power of fascination, why take so much trouble? why not remain at the bottom of the tree and practise its enchantments? A trustworthy observer describes a black snake climbing a tree, in order to get at the young of a Baltimore bird in a nest at the extremity of a branch, which was so slender that the serpent found it impossible to come at the nest by crawling along it; he therefore took advantage of another branch which hung above the nest, and, twisting a portion of his tail round it, was able, by stretching the remainder of the body, to reach the nest, into which he insinuated his head, and thus glutted his appetite with the young birds. There is evidently no fascination here, for we see the reptile exerting all his ingenuity to obtain his prey.

If the serpent really possessed this fascinating power, how does it happen that all the American serpents are the food of different kinds of birds? Even the rattle-snake, whose poison produces such alarming symptoms in man and other animals, is frequently devoured by some of the stronger and more courageous birds, such as the swallow-tailed hawk and the larger kinds of owl. Even the hen has been known to leave her affrighted chickens and attack with her beak a rattle-snake, kill it, and devour the greater part of the reptile's body. Nor is this surprising, when it is considered how very small a stroke upon any part of its body disables it from running, and a slight shock on the top of its head is followed by instant death. The skull-bone is so remarkably thin and brittle, that a stroke from the wing of the thrush or robin is sufficient to break it.

In conclusion, we trust enough has been said to show the absurdity of this common superstition. The progress of science and the cause of truth are sadly impeded by the many superstitious notions which prevail in natural history. "Under their influence we fall from our dignity, and are often rendered unhappy. It should be one of the principal objects of science to rear and prop the dignity of the mind, and to smooth its way to comfort and to happiness. The ills and infirmities of our earthly state of being are numerous enough. It is folly, if not vice, to increase them. He who seriously believes that a hideous reptile is gifted from the sacred Source of universal life and good with the power of fascinating birds, squirrels, and other animals, will hardly step here. He may, and probably will, believe much more. He will not, perhaps, think himself entirely exempted from this wonderful influence. He may suppose that the property belongs to other beings besides the serpents; and he will, perhaps, imagine that

it forms a part of a more extensive plan; the effects of which, he will assert, are prominent and unequivocal, though its ways, he will confess, are incomprehensible to mortal minds."

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAPTER XI.

THE COUNCIL OF WAR.

THE place of meeting appointed by Peter Barnett was easily discovered, and having tied my horse up under a shed, which served the double purpose of stable and coach-house, I took possession of a small room with a sanded floor, and, throwing myself back in a most uneasy easy chair, began to think over the interview I had just had, and endeavour to devise some practicable plan for the future. The first thing was to establish free means of communication with Clara, and this I hoped to accomplish by the assistance of Peter Barnett. I should thus learn Mr. Vernon's proceedings, and be able to regulate my conduct accordingly. If, as I dreaded, he should attempt to force on the marriage immediately, would Clara, alone and unassisted, have sufficient courage and strength of purpose to resist him? I feared not; and how was I effectually to aid her? The question was more easily asked than answered. It was clear that her fortune was the thing aimed at, for I could not believe either Mr. Vernon or his nephew likely to be actuated by disinterested motives; and it was to their avarice then that Clara was to be sacrificed—had she been portionless she would have been free to marry whom she pleased. Of all sources of evil and misery money appears to be the most prolific; in the present case its action was twofold,—Clara was rendered wretched in consequence of possessing it, while the want of it incapacitated me from boldly claiming her hand at once, which appeared to be the only effectual method of assisting her.

My meditations were at this point interrupted by the arrival of my future privy counsellor, Peter Barnett, who marched solemnly into the room, drew himself up to his full height, which very nearly equalled that of the room, brought his hand to his forehead in a military salute, and then, closing the door cautiously, and with an air of mystery, stood at ease, evidently intending me to open the conversation.

"Well, Peter," began I, by way of something to say, for I felt the greatest difficulty in entering on the subject which then occupied my thoughts before such an auditor. "Well, Peter, you have not kept me waiting long; I scarcely expected to see you so soon: do you imagine that Mr. Vernon will remark your absence?"

"He knows it already," was the reply. "Why, bless ye, Sir, he ordered me to go out himself."

"Indeed, how was that?"

"Why, as soon as you was gone, Sir, he pulled the bell like mad. 'Send Mr. Richard here,' says he. 'Yes, Sir,' says I, 'certainly, only he's not at home, Sir.' When he heard this he grumbled out an oath, or sumthin' of that natur, and I was going to take myself off, for I see he wasn't altogether safe, when he roars out 'Stop!' ('You'd a said "halt" if you'd a been a officer or a gentleman, which you ain't neither,' thinks I.) 'What do you mean by letting people in when I have given orders to the contrary?' says he. 'Who was it as blowed me up for sending away a gent, as said he wanted to see you on partiklar business, only yesterday?' says I. That bothered him nicely, and he didn't know how to be down upon me, but at last he thought he'd serve me one of his old tricks. So he says, 'Peter, what are you doing to-day?' I see what he was at, and I thought I'd catch him in his own trap. 'Very busy a cleaning plate, Sir,' says I. This was enough for him: if I was a cleaning plate, in course I shouldn't like to be sent out,

so says he 'Go down to Barnaley, and see whether Mr. Cumberland is there.' 'But the plate, Sir?' 'Never mind the plate.' 'But it won't never look as it ought to do if I'm sent about in this way,' says I. 'Do as you're ordered, and leave the room instantly,' says he, grinding his teeth reg'lar savage-like. So I took him at his word, and come away to see you as hard as I could pelt; but you've put him into a sweet temper, Mr. Fairloagh."

"Why, that I'm afraid was scarcely to be avoided," replied I, "as my business was to inform him that I considered his nephew an unfit person to marry his ward."

"Oh! did you tho?—did you tell him that?" cried my companion, with a chuckle of delight; "that was right: I wonder how he liked it!"

"As he did not exactly agree with me in this opinion, but, on the contrary, plainly declared his intention of proceeding with his scheme in spite of me, it is necessary for me to consider what means I can best use to prevent him from accomplishing his object; it is in doing this that I shall require your assistance."

"And what does Miss Clara say about it, young gentleman?" inquired the old man, fixing his eyes on me with a scrutinizing glance.

"Miss Saville dislikes Richard Cumberland, and dreads the idea of being forced to marry him above everything."

"Ah! I know she does, poor lamb; and well she may, for there ain't a more dissipated young scoundrel to be found nowhere than Mr. Vernon's precious 'nephew,' as he calls him, tho' it's my belief he might call him 'son' without telling a lie."

"Indeed! I was not aware that Mr. Vernon had ever been married."

"No; I never heard that he was reg'lar downright married; but he may be his son for all that. Howsum-ever, praps it is so, or praps it ain't; I'm only a tellin' you what I fancies, Sir," was the reply. "But what I wanted to know," he continued, again fixing his eyes on my face, "is, what does Miss Clara say to you? eh?"

"You put home questions, my friend," replied I, colouring slightly, "however, as Miss Saville tells me you are faithful and trustworthy, and as half-confidences are never of any use, I suppose you must hear all about it." I then told him as concisely as possible of my love for Clara, and my hopes of one day calling her my own; pointing out to him the difficulties that stood in the way, and explaining to him that the only one which appeared to me insurmountable, was the probability of Mr. Vernon's attempting to force Clara into an immediate marriage with Cumberland; being thus situated, I showed him the necessity of establishing some means of communication between Clara and myself, as it was essential that I should receive the earliest possible information in regard to Mr. Vernon's proceedings.

"I understand, Sir," interrupted Peter, "you want to be able to write to each other without the old 'un getting hold of your letters; well, that's very easily managed; only you direct to Mr. Barnett, to be left at the Pig and Pony, at Barstone, and anything you send for Miss Clara I'll take care and give her when nobody won't be none the wiser for it; and any letters she writes, I'll put into the Post myself. I'd do anything rather than let that young villain Cumberland have her, and make her miserable, which his wife is safe to be if ever he gets one; and, if you likes her, and she likes you, as seems wery probable, considering you saved her from being burnt to death, as they tell me, and is werry good-looking into the bargain,—which goes a great way with young ladies, if you'll excuse the liberty I takes in mentioning of it,—why, the best thing as you can do, is to get married as soon as you can."

"Very pleasant advice, friend Peter," returned I, "but not so easily acted upon; people cannot marry now-a-days without something to live upon."

"Well, ain't Miss Clara got Barstone Priory, and

plenty of money to keep it up with? won't that do to live upon?"

"And do you imagine I could ever feel content to be the creature of my wife's bounty? prove myself a needy fortune-hunter, as that old man dared to term me!" exclaimed I, forgetting the character of my auditor.

"Barstone Priory to live in, and more money than you know what to do with, ain't to be sneezed at, neither," was the answer, "though I likes your independent spirit too, Sir; but how do you mean to manage, then?"

"Why, Mr. Vernon hinted that if his ward married without his consent, her fortune was to be forfeited."

"Ah! I believe there was something of that nature in the will; my poor master was so wrapped up in old Vernon, that he wrote just wot he told him; if he'd only a lived to see how he was going to use Miss Clara, he'd a ordered me to kick him out of the house, instead."

"Perhaps that pleasure may be yet in store for you, Peter," replied I, laughing at the zest with which he uttered the last few words, and an involuntary motion of the foot by which they were accompanied; "but this power, which it seems Mr. Vernon really possesses, of depriving Miss Saville of her fortune, removes my greatest difficulty; for in that case, if he should attempt to urge on this match, I can at least make her the offer of sharing my poverty: there is my mother's roof to shelter her, and, if her guardian refuses his consent to our marriage, why, we must contrive to do without it, that is all. And now, Peter, if you will wait a few minutes, I will give you a note for your young mistress, and then get to horse without further loss of time;" and, calling for pen, ink, and paper, I hastily scribbled a few lines to Clara, informing her of the events of the morning, and of my unalterable determination to save her from a union with Cumberland, begging her at the same time to continue firm in her opposition, to acquaint me with everything that might occur, and to rely upon me for protection in the event of anything like force being resorted to. I then entrusted my note to old Peter, begged him to watch master Richard Cumberland closely, told him that upon his care and vigilance depended in great measure the happiness of his young mistress's life; tipped him handsomely, though I had some trouble in making him take the money, and, mounting my ill-disposed horse, rode back to Hillingford, on the whole tolerably well satisfied with my morning's work.

I found two letters awaiting my return: one from my mother, to say that she should be at Heathfield Cottage on the following day, and begging me to meet her; the other from Ellis, telling me that at length he hoped Oaklands was in a fair way to recover, it having been ascertained that a piece of the wadding of the pistol had remained behind when the ball was extracted; this had now come away, and the wound was healing rapidly.

As his strength returned, Harry was growing extremely impatient to get back to Heathfield, and Ellis concluded by saying that they might be expected any day, and begging me at the same time to remember, that from the first he had always declared, in regard to his patient, that it would have killed any other man, but that it *could* not kill him.

Days gilded by the absentees returned, and matters fell so completely into their old train again, that the occurrences of the last eight months seemed like the unreal creations of some fevered dream, and there were times when I could scarcely bring myself to believe them true.

Harry Oaklands had recovered sufficiently to resume his usual habits, and, except that he was strictly forbidden to over-exert or fatigue himself, (an injunction he appeared only too willing to obey,) he was nearly emancipated from medical control. Fanny had in great measure recovered her good looks again; a slight delicacy of appearance, however, still remained, giving a tone of spirituality to the expression of her features, which was

not before observable, and which to my mind rendered her prettier than ever: the listlessness of manner which had made me uneasy about her in the autumn had vanished, and her spirits seemed good; still she was in a degree altered, and one felt in talking to her that she was a child no longer. Like Undine, that graceful creation of La Motte Fouqué's genius, she appeared to have changed from a "tricksy sprite," into a thinking and feeling woman.

One morning Oaklands and Ellis came to the cottage together, the latter in a great state of joy and excitement, produced by a most kind and judicious exercise of liberality on the part of Sir John. About a month before, the grave and pompous Dr. Probehurt had been seized with an illness, from which in all probability he would have recovered had he not steadily refused to allow a rival practitioner to be called in, in order that he might test a favourite theory of his own, embodying a totally novel mode of treatment for the complaint with which he was attacked. Unfortunately, the experiment failed, and the doctor died. Sir John, who had been long anxious to evince his gratitude to Ellis for the skill and attention he had bestowed upon his patient, the moment he heard of the event, determined to purchase the business: he had that morning completed the negotiation, and offered the practice to Ellis, stating that he should consider his accepting it in the light of a personal favour, as in that case he would be always at hand, should Harry feel any lasting ill effects from the wound. Ellis's joy was most amusing to witness.

"I tell you what, Sir," he exclaimed, seizing me by a button of the coat, "I'm a made man, Sir! there isn't a better practice in the county. Why, poor Probehurt told me himself, old Mrs. Croaker Crawley alone was worth 100*l.* per annum to him:—four draughts and two pills every day—prescription very simple—*R. Pil. panis compos. ij. nocte sum.—haust. aqua vitæ ʒ, aqua puræ ʒ, sacchar. viij. grs. pro re nata.* She's a strong old girl, and on brandy-and-water draughts and French-roll pills may last for the next twenty years. Noble thing of Sir John, very; pon my word it has quite upset me—it's a fact, Sir, that when Mr. Oaklands told me of it, I sat down and cried like a child; I'm not over tender-hearted, either; when I was at Guy's, I amputated the left-leg of a shocking accident, and dissected the porter's mother-in-law (whom he sold us cheap for old acquaintance sake) before breakfast one morning, without finding my appetite in the slightest degree affected; but, when I learned what Sir John had done, I positively cried, Sir."

"I say, Ellis," interrupted Harry, "I am telling Miss Fairleigh I shall make you take her in hand—she has grown so pale and thin I am afraid she has never recovered all the trouble and inconvenience we caused her."

"If Miss Fairleigh would allow me, I should recommend a little more air and exercise," replied Ellis: "are you fond of riding on horseback?"

"Oh, yes!" replied Fanny, smiling, and blushing slightly at thus suddenly becoming the topic of conversation, "that is, I used to delight in riding Frank's pony in days of yore, but he has not kept a pony lately."

"That is easily remedied," returned Harry; "I am certain some of our horses will carry a lady. I shall speak to Harris about it directly, and we'll have some rides together, Fanny; it was only this morning that I obtained my tyrant's permission to cross a horse once more," he added, shaking his fist playfully at Ellis.

"The tyrant will agree to that more willingly than to your first request. What do you think, Fairleigh," continued Ellis, appealing to me, "of his positively wanting to go out hunting?"

"And a very natural thing to want, too, I conceive," replied Harry, "but what do you think of his declaring that, if I did not faithfully promise not to hunt this season, he would go into the stables, and divide, what he

called in his doctor's lingo, the *flexor metatarsi* of every animal he found there, which, being interpreted, means neither more nor less than hamstringing all the hunters."

"Well, that would be better than allowing you to do any thing which might disturb the beautiful process of granulation going on in your side—I remember when I was a student at Guy's—"

"Come, Doctor, we positively cannot stand any more of your 'Chronicles of the Charnel House' this morning; you have horrified Miss Fairleigh already to such a degree that she is going to run away. If I should stroll down here again in the afternoon, Fanny, will you take compassion on me so far as to indulge me with a game of chess? I am going to send Frank on an expedition, and my father and Ellis are off to settle preliminaries with poor Mrs. Probehurt, so that I shall positively not have a creature to speak to. Reading excites me too much, and produces a state of — what is it you call it, Doctor?"

"I told you yesterday, I thought you were going into a state of coma, when you fell asleep over that interesting paper of mine in the *Lancet*, 'Recollections of the Knife,' if that's what you call excitement," returned Ellis, laughing.

"Nonsense, Ellis, how absurd you are," rejoined Oaklands, half-amused and half-annoyed at Ellis's remark; "but you have not granted my request yet, Fanny."

"I do not think we have any engagement—mamma will, I am sure, be very happy,"—began Fanny, with a degree of hesitation for which I could not account, but, as I was afraid Oaklands might notice it, and attribute it to a want of cordiality, I hastened to interrupt her by exclaiming, "Mamma will be very happy—of course she will—and each and all of us are always only too happy to get you here, old fellow—it does one's heart good to see you beginning to look a little more like yourself again. If Fanny's too idle to play chess, I'll take compassion upon you, and give you a thorough beating myself."

"There are two good and sufficient reasons why you will not do any thing of the kind," replied Oaklands,—"in the first place, while you have been reading mathematics, I have been studying chess, and I think that I may, without conceit, venture to pronounce myself the better player of the two—and, in the second place, as I told your sister just now, I am going to send you out on an expedition."

"To send me on an expedition," repeated I, "may I be allowed to inquire its nature—where I am to go—when I am to start—and all other equally essential particulars?"

"They are soon told," returned Oaklands, "I wrote a few days since to Lawless, asking him to come down for a week's hunting before the season should be over, and this morning I received the following characteristic answer:—'Dear Oaklands, a man who refuses a good offer is an ass, (unless he happens to get a better one), now, your's being the best offer down in my book at present, I say "done, along with you, old fellow," thereby clearly proving that I am no ass. Q. E. D.—eh? that's about the thing, isn't it? Now look here, Jack Bassett has asked me down to Storley Wood for a day's pheasant shooting, on Tuesday: if you could contrive to send any kind of trap over about lunch-time, on Wednesday, I could have a second pop at the long-tails, and be with you in time for a half-past six o'clock feed, as it is not more than ten miles from Storley to Heathfield. I wouldn't have troubled you to send for me, only the tandem's *hors de combat*—I was fool enough to lend it to Muffington Spoffkins, to go and see his aunt, one fine day. The horses finding a fresh hand on the reins, began pulling like steam engines—Muffington could not hold them—consequently they bolted—and after running over two infant schools, and upsetting a retired grocer, they knocked the cart into "immortal smash" against a turnpike-gate, pitching Spoffkins into a horse-pond, with Shrimp a-top of him. It was a regular

sell for all parties: I got my cart broken to pieces, Shrimp was all but drowned, and Muffington's aunt cut him off with a shilling, because the extirpated squadron of sucklings turned out, unfortunately, to have been composed of the picked infants of her own village. If you could send to meet me at the Feathers' public house, which is just at the bottom of Storley great wood, it would be a mercy, for walking in cover doesn't suit my short legs, and I'm safe to be sown up.—Remember us to Fairleigh, and all inquiring friends, and believe me to remain, very heartily, yours, George Lawless."

"I comprehend," said I, as Oaklands finished reading the note, "you want me to drive over this afternoon and fetch him; it will be a great deal better than merely sending a servant."

"Why, I had thought of going myself, but, 'pon my word, these sort of things are so much trouble, at least to me, I mean,—and, though Lawless is a capital excellent fellow, and I like him extremely, yet I know he'll talk about nothing but horses all the way home—and not being quite strong again yet, you've no notion how that kind of thing worries and tires me."

"Don't say another word about it, my dear Harry; I shall enjoy the drive uncommonly. What vehicle had I better take?"

"The phaeton, I think," replied Oaklands, "and then you can bring his luggage, and Shrimp, or any of his people he may have with him."

"So be it," returned I, "I'll walk back with you to the Hall, and then start as soon as you please."

THE DRAMA IN THE MIDDLE AGES.

SECOND ARTICLE.

In a recent notice on this subject, we briefly sketched the history of the drama down to the fourteenth century, illustrated by a few specimens of the religious plays, or *Mysterica*. In the present article, we propose to show the further changes which the drama underwent until it finally merged into the historical plays of the Elizabethan period. With the progress of language, and the spread of intelligence, the people began to grow tired of the grave and tedious *Mysterica*, and a new kind of dramas, called *Moralities*, made their appearance; which, although frequently of a tragic character, were generally interspersed with scenes of gallantry or satire; and, notwithstanding the decrees of the Councils forbidding the employment of any but the Latin language in dramas at all related to sacred subjects, they were written in the popular idiom, and performed on temporary stages, erected wherever an audience could be brought together. The *jongleurs* and minstrels began to take a part in the performances which became the chief attraction at the festivals, and plenary courts of the nobles; and, as the popular element increased in power, and the knowledge of Latin was lost, so did the populace at markets and fairs delight in plays written in the vulgar idiom.

The minstrels and players began to find it as profitable to amuse the rising class of artisans as to divert the nobles. They lent themselves to the growing spirit of the age, and their plays were the vehicle by means of which the lower orders vented their grievances, or satirized the vices and tyranny of their superiors. The laxity of manners among the clergy was made a standard subject of reproach and ridicule: the popular eye was quick to detect any dereliction of principle, and the popular tongue to speak its rebuke. That, in many instances, the public sarcasm was not unmerited, may be inferred from a description of the ceremonial to take place on Easter Sunday, by Father Isla, one of the clerical fraternity. "The Sermon of Pleasantries," he says, "will be preached at 5 o'clock in the morning. In this sermon, it is necessary for the preacher to have all the merry tales, droll fancies, jests, jokes, and witticisms;

all the quips, cranks, bams, busters, and buffoonery he can rake together, to divert the immense concourse who come to hear him. He has no need to be nice and squeamish, let them be of what kind they will, however filthy, beastly, or indecent; for it is well known that every thing passes upon this day.... The Father Preachers who have brought a droll lay-brother with them for their companion (for some have brought such an one) have ordered the lay-brother to get up in the pulpit and preach a burlesque sermon, with all manner of Merry-Andrew tricks. In general, these sermons end with a mock act of contrition, and instead of a crucifix, the lay-brother brings out from under his habit a pye, a hock of bacon, or a bottle of wine, which he addresses with a thousand amorous expressions in the tone of repentant sorrow, making the audience ready to die with laughter."

From this specimen of the character of the clergy, as described by one of themselves, we may well imagine that the popular writers of the period would be unsparing in their burlesque and satire upon the priesthood. The *trouwerre*, a portion of the minstrel class, who composed their poems and plays, as well as sung them, laughed at the edicts issued to prevent the degradation of the Latin language, and wrote numerous pieces, full of life and originality, abounding in bitter personalities and cutting sarcasm. Leaving grave subjects to the erudite, they threw their whole genius with singular exuberance into their plays. These plays were, in fact, what popular lectures are now, a means of communicating information to large numbers of hearers at once, but relieved and highly seasoned with the author's wit. So great was the number of saints' days and holidays in the period of which we write, that it would, perhaps, have been difficult to keep the turbulent population in good humour, without some such recreation as that afforded by the half-serious, half-comic dramas. The holidays were not unfrequently made the subject of complaint: all work being forbidden on those occasions, some of the artisans remonstrated that the loss of so many days' work was a serious injury to them. Voltaire has left on record a curious account of a gentleman-farmer, ruined by the priest for preferring to plough his fields on a saints' day to drinking in a tavern. "The prodigious number of holidays," it was said, "in the contrivance of tavern-keepers: the religion of peasants and artisans consists in intoxicating themselves on the festival of a saint whom they know only by this means. It is on these days of idleness and debauchery that all sorts of crimes are committed: it is the holidays which fill the prisons, and support the guards, notaries, criminal officers, and executioners. Catholic fields are scarcely tilled; while those of the heretics, cultivated every day, produce abundant harvests."

Plays of the character above described, were frequently acted at the festivals of St. Nicholas, the patron saint of children and scholars. This was one of the occasions on which the church relaxed a little of her discipline. From the sixth century downwards, St. Nicholas had been celebrated by songs and games, sometimes of a dramatic character, held either within the convents to which schools were attached, or in their immediate neighbourhood, by the schoolmaster and his scholars. One of these, written by Hilary, is—"Concerning saint Nicholas and a certain Jew." The latter had confided his treasure to the keeping of the statue of the saint; during the absence of the over-confident Israelite, a party of robbers found and carried off the deposit. The Jew on his return, enraged at his loss, lays violent hands on the statue, and overwhelms it with the most opprobrious insults. The saint, to avenge his compromised honour, appears to the thief at night, and forces them to return the money.

The *Jeu de Saint Nicolas*, or Play of Saint Nicholas, is a piece full of life and movement, and boisterous gaiety. The discourse, intermingled with gibes and jests of gamblers and drunkards, now very obscure,

doubtless afforded the greatest amusement to the populace of the day. The following specimen reminds us of the cries of the London apprentices in the reigns of the Edwards and Henrys. The tavern-crier Raoulet, is standing at the door of his master's tap, proclaiming, as was then the custom, the goodness of the wine:—"Here," he cries, "is wine newly-tapped. Full pint, full barrel. Honest wine, drinkable, mellow and full. Lively as a squirrel in the wood. Not rotten, or sour after taste. Wine dry and light, running fair from the lees. Clear as a sinner's tear. Fit for the throat of a jolly fellow, and no other ought to drink it. See how it devours its foam; how it mounts, sparkles, and hisses. Ever so little on the tongue, gives the taste of a famous wine in the heart."

Adam de la Halle, known as the hunchback of Arras, was one of the most popular French dramatists of the fourteenth century. His works, which were written in the Norman dialect, abound in quaint fancies, and display much frankish cunning, and fantastic gaiety, intermingled with simple and graceful pastorals. Among these *Robin and Marion*; and the *Marriage of Adam, or, the Bower*; were the delight of the good citizens of Arras. The characters of this piece are seventeen in number: Adam de la Halle, the author, Maistre Henry, his father, a mercer, physician, innkeeper, monk, fool, and some portly merchants of the city, with women, fairies, and the common people. It is the month of May, the season in which the fairies make their annual visit. A bower, whence the name of the play, has been built for their reception outside the gates of the town, where a knot of citizens are waiting the arrival of the sprightly visitors.¹ The piece opens with a malicious verbal castigation of the most notable inhabitants of Arras, by the author, who enters, dressed as a travelling student, in brown cape and cassock, and approaching the group of bourgeois collected near the bower. "Do ye know, sirs," he asks, "why I have changed my garb? I took a wife; but now I return to the clergy; I am going to revive my ancient dreams, but first wish to take leave of ye all. Don't laugh: I am not so much taken with Arras and its pleasures as to desire to renounce study for them. Since heaven has given me some genius, it is time to set myself to work; I have too long emptied my purse in this place."

Here one of the bystanders inquires what is to become of his young wife Marie, and reminds him that his reflections should have been made before marriage. "By my faith," replies Adam, "that is talking like an oracle; but who can be wise in youth? Love seized me in the first heat; just in the green and ardent season, when it has the most lively season. No one, now-a-days, thinks of what is best, but of what best answers his desires. The summer was sweet and serene, green and flowery, gladdened by the song of little birds; I was seated beneath the branches of tall trees in the wood, near a fountain flowing over pearly sand, when the vision of her who is now my wife, appeared to me; now she seems pale and yellow." He then gives a long and minute description of his Marie, as she first charmed him. Such was the effect of her presence, that he confesses: "I lost all empire over my reason, and was happy only when, instead of clerk, I became husband." He concludes with a farewell to the city. "Arras, Arras, city of lawsuits, hatred and treasons. Farewell, a hundred thousand times and more. I go elsewhere to study the evangel."

As Adam is about to go, comes his old father, Maistre Henry, and greatly applauds his resolution: "Good son," he says, "I pity thee for having lost thy time for a wife; now be wise and depart." But the young man reminds his father that he cannot live in the metropolis unless provided with money. "One can't live at Paris for nothing." The father replies, that he has no money,

and is besides, old, infirm, and full of aches and pains. A physician, who hears these complaints exclaims, "Well know I of what you are ill; it is a disease called avarice," and goes on unsparingly to enumerate all the citizens of Arras afflicted with the same malady. Other personages enter and take part in a dispute that arises out of the physician's censorious remarks, and in the midst of it comes a priest bearing the relics of St. Acarius, on which the disputants cease their quarrel, and join in doing homage, and paying their contributions to the sacred remains. Among others, an idiot presses forward; but, after he has touched the bones, utters greater follies than before, under which, however, are concealed a series of sarcasms against the loose manners of the clergy. The fairies next make their appearance, followed by Hellequin, the prototype of the modern Harlequin. Riquet, a citizen, and Adam, prepare a table for the three fairy queens, Arsile, Maglore, and Morgane; but, unfortunately, no knife has been laid for Maglore, whose anger is greatly excited by the neglect. Morgane, on the contrary, well satisfied, proposes to reward the preparers of the feast; for Riquet she wishes plenty of money, and for Adam, that he may be the most amorous clerk in the world. Arsile promises that the latter shall be jovial, and a good writer of songs, and that Riquet shall buy all his merchandize cheap, and at good profit. But Maglore has not forgotten her anger; she wishes that Riquet may never have a hair on the crown of his head, and for Adam, who boasts of going to the schools at Paris, that he may do nothing but stay in Arras, and forget himself in the arms of his young and loving wife.

The fairies then give a specimen of their supernatural skill, and take their departure, singing a motet, and followed by Hellequin chanting "Say, fits my hat well?" A drinking scene, without which no drama at that period would have been complete, ensues—the monk, with his saintly relics, is unmercifully jeered, and the sitting terminates in a boisterous chorus, "Aia sat on a high tower." After which the crowd disperses; each one returns to his own home: and thus ends this first specimen of early French comedy.

In London, the company of parish clerks were for a long period the only performers. They acted before Richard II. and his queen in 1390; and, as recorded by Maitland, again in 1409, "with great applause, for eight days successively, at Skinner's Well, near Clerkenwell, a play concerning the Creation of the World, at which were present most of the nobility and gentry of the kingdom." We have already instanced some of the mutations of the dramatic art: pageants, morrice-dances, mimes, mummeries, and Christmas carols, are among the more prominent changes. The readers of Scott's novels are acquainted with his description of the Abbot of Unreason and his revels. Of a similar character were the festivals of the Boy Bishop in England, and of the Ass in France. In 1539 Sir David Lyndsay wrote his famous play, *The Thre Estates*, in which the ceremonies and superstitions of the Church are severely criticised and condemned. Religious plays, however, had not ceased to be represented in Scotland so late as 1600; in which year, by the exertions of the Presbyterians, they were forbidden at Perth as a "dishonour of the hault town."

In the sixteenth century the dramatic art made further progress. The first regular English tragedy, *Ferrex and Porrex*, was written in 1561; it contains several passages of great power and beauty. In 1575 appeared, what was long considered to be the first comedy, entitled, *Gammer Gurton's Needle*: late researches, however, give the precedence, by some years, to another play, *Ralph Roister Doister*; a piece full of point and humour, which remains the earliest specimen of English comedy. From this we pass by a succession of writers to the historical plays by which Shakspeare rendered his name immortal—and bring our remarks to a close.

(1) A similar custom prevailed in this country: in many parishes Robin Hood's Bowers were set up on certain holidays in the spring.

A LAND JOURNEY ROUND THE WORLD.¹

AFTER observing the various matters of interest in the Indian territory, Sir George Simpson passed into the Oregon district, or, as it may be called, the Columbia region. Most of the critical debates between Great Britain and the United States have been terminated since the voyage of our traveller; and we must, therefore, pass over the arguments bearing upon the claims of the two countries to this territory. It may, however, be observed, that the region was brought under the influence of English civilisation by the North-western Fur Company, which coalesced in 1821 with the Hudson's Bay association, and thus the whole district came under the control of the latter body. It is a singular illustration of the influence of commerce, that the greater part of North America has been laid open to civilisation by the fur-trade. That the sale of the skins of certain small animals should be the means of changing the destinies of half a continent, does not seem surprising to us, who know the mighty results accomplished by the merchant's footstep in other regions; but it is, nevertheless, a wonderful fact in the history of the world.

Sir George, at last, reached Fort Vancouver, a station on the Columbia, after a journey of five thousand miles across the widest part of the American continent, through lakes and up rapid rivers, in which twelve weeks of constant labour tested the physical powers and patience of the party. Vancouver was an important point in this journey, as from it the governor made first a trip to the Russian settlement at Sitka, and next to the coast of California; after which the determined tourist sailed for the Sandwich Islands; and, having satisfied his curiosity in these fair isles, again returned to Sitka. These voyages to and fro may not seem to be comprehended in the plan of a journey round the world, being rather a deflection from the direct course; but, as more than half the first volume is occupied in these trips, we must not omit some notice of the important places brought before us by this portion of Sir George Simpson's work. The journey to Sitka, we may be certain, was not the result of mere curiosity, for that settlement being the head-quarters of the Russian fur-trade in America, was a place of importance in the eyes of the governor of the great British Company, especially as he holds the opinion, that England and Russia are destined to absorb the whole power of the world. If the reader will examine the north-west coast of America in lat. 57°, he will see a small island forming one of the group once known as George the Third's Archipelago, but now called Sitka, or, New Archangel. The settlement was founded in 1804, by the Russian Baranoff, and is now the centre of the Czar's influence along that coast. Thousands of seals, otters, beavers, and sea-horses, are annually slaughtered to support the constant demand for furs and ivory; and, as twenty thousand teeth of the sea-horse are required yearly, and each horse produces but two, ten thousand of these large animals die yearly to supply the ivory trade alone in these remote seas. The surprise manifested at the sight of a steam-vessel, and the superstitious awe in which a piece of writing is held, prove how little the natives of these regions are conversant with the resources of that civilized world, now pressing upon their most secluded homes.

After the arrival of the emigrants from Red River, their guide, a Cree of the name of Bras Croche, took a short trip in the Beaver. When asked what he thought of her, "Don't ask me," was his reply; "I cannot speak; my friends will say that I tell lies when I let

them know what I have seen; Indians are fools, and know nothing. I can see that the iron machinery makes the ship to go, but I cannot see what makes the iron machinery itself to go."

Bras Croche, though very intelligent, and like all the Crees, partially civilized, was, nevertheless, so full of doubt and wonder, that he would not leave the vessel till he got a certificate to the effect, that he had been on board a ship which needed neither paddlers nor sails. Though not one of his countrymen would understand a word of what was written, yet the most sceptical among them would not dare to question the truth of a story which had a document in its favour. A savage stands nearly as much in awe of paper, pen, and ink, as of steam itself; and, if he once puts his cross to any writing, he has rarely been known to violate the engagement which such writing is supposed to embody or to sanction. To him, the very look of black and white is a powerful medicine.

We must now bear in mind that the Russian government has not expended all its care on the development of trade, but has also provided for the spiritual interests of its people; a bishop, with fifteen priests and other clergy being placed in this remote spot. When the governor had completed his examination of Sitka and its resources, he returned to Vancouver, and, immediately set sail for St. Francisco, on the coast of California. To follow him through this route, would require an undue extension of these articles; but, we cannot help noticing the agreement between the prediction of Sir George Simpson on the fate of California, and its seizure by the forces of the United States, during the present war against Mexico. "English, in some sense or other of the word," says he, "the richest portions of California must become; either Great Britain will introduce her well-regulated freedom of all classes and colours, or the people of the United States will inundate the country with their own peculiar mixture of helpless bondage and lawless insubordination." The corruption of the government, the rapacity of the officials, and the general insubordination of all classes, were forced upon the traveller's attention at every step, and displayed themselves amidst the symbols of republicanism. With such proofs of national demoralization, it was impossible not to see the gloomy issue lowering over the light-hearted, indolent Californians.

Leaving this country the governor sailed for the famed Sandwich islands, memorable for the death of Cook, and remarkable for the indications they afford of fierce volcanic agencies once working in those homes of the Pacific. One fact, mentioned by Sir George Simpson, suggests the probable origin of the term *Pacific*, as applied to that vast ocean which stretches for ten thousand miles across the globe. During a run of two thousand three hundred miles the breeze blew with so gentle and agreeable a force that neither studding nor sky sails were once taken in. "If it was under similar circumstances, as is said to have been the case, that Magellan, the first European that traversed this ocean, and probably the first navigator that spanned it at a stretch, made his way from South America to the Philippines, he could not probably have bestowed upon it a name more appropriate and expressive than that of the Pacific. Nor did his individual experience differ from the general fact. Excepting in its most northern and more southern latitudes, this boundless sea is ordinarily so calm that open boats may cross it with safety, and in fact, its least sheltered portion, lying between the Polynesian islands and Spanish America, and almost equalling the breadth of the Atlantic, has actually been so traversed, Captain Hinckley having carried a number of horses, (rather ugly customers by-the-by, for the occasion), in an undecked vessel from California to Woatool, one of the Sandwich Islands. It is doubtless this characteristic tranquillity of the Pacific Ocean which has been the means, under Providence, of peopling almost every islet that floats on its bosom." Four of

(1) Concluded from page 268.

the Sandwich Islands send up high peaks which are seen far off at sea by the distant mariner; two of these volcanic mountains rise from the island of Elawaii to the height of thirteen thousand feet, being visible at a distance of more than fifty leagues. This strengthens the supposition that the whole group must have been seen by the Spaniards who navigated those seas in the 16th and 17th centuries; indeed *proofs exist* of an intercourse between the natives and the Spaniards at a distant period.

The once active craters of the Sandwich group are all extinct, save one on Mount Loa, which still utters most significant hints of the powers once raging in these beautiful seas. Civilisation may now be said to have fixed her home firmly in these islands; whither science, commerce, and christianity have entered from Europe. A regular government is established, consisting of what we call king, lords, and commons, the nobles being fifteen chiefs selected by the king, forming therefore a species of elective peerage; whilst the commons consist of seven representatives chosen by *all* the inhabitants of Hawaii. Those, then, who are enamoured of universal suffrage might find some gratification from a residence in Hawaii. For the satisfaction of some ambitious ladies in England we must add, that nearly one half of the Hawaiian house of lords consists of the lady peeresses. In the whole group are thirteen islands, of which four alone claim the attention of the navigator, either from their population or the convenient position of their harbours. Hawaii, formerly called Owhyhee, where Cook perished, is the largest, measuring a hundred miles in length and about eighty in breadth where widest; the remains of an extinct crater, or rather volcanic lake, twenty-four miles in circumference, are visible in this former home of subterranean fires. The inhabitants are estimated at about 40,000, being chiefly found on the narrow girdle of land round the coast, for the dry lava-like interior presents few attractions to settlers. Mowee, the island next in size, is about forty-eight miles long, and twenty-eight miles wide. Woahoo, having a surface nearly equal to that of Mowee, is important to the navigator on account of being the seat of government, and possessing the most important harbour called Honolulu, whither numerous whaling ships repair for provisions and repairs. This place, the centre of civilisation for these islands, has a population of nine thousand, of which one thousand are probably English and Americans, or descended from these. Thus have been linked to Europe, by a system of commerce and christianity, these remote lands, the discovery of which, toward the close of the last century, excited the curiosity of our fathers, and may yet draw within the circle of civilisation the far-stretching groups of Polynesia. One fact in the history of these islands is rather startling, and suggests the possibility that, at some future period, the whole native population may become *extinct*. The number on every island *appears to diminish*. Vancouver, the companion of Cook, conjectured that the population had much diminished in the short period of thirteen years which had elapsed between the time of Cook and his own visit; and later observations confirm this melancholy fact in the statistics of these fair islands. A census was taken in 1832, when the population returns amounted to 130,000; four years later another enumeration was made, when the numbers were only 109,000, presenting a most singular instance of decrease, and almost forcing us to suspect some blundering in taking the census. But the same dark item is again presented by the enumeration in 1840, when the whole population was reckoned at 88,000. Even if we distrust these returns, which we have no just reason for doing, there are other circumstances pointing in the same ominous direction. The disproportion in some districts between the births and deaths, in a given period, is so great, that nothing but destruction awaits the people should the same state of things continue.

Thus, in a certain part of Woahoo, the most fertile in

the island, the births for a year were but sixty-one, whilst the deaths in the same period were 132. In the most cultivated part of another island it was found that among 5,541 adults there were only "sixty-eight men and sixty-five women who had more than two children each." Some ascribe this diminution to the trade in sandalwood, which was sold to the idolaters at China to burn as a fragrant offering in their temples. The labours undergone in procuring this from the almost inaccessible mountain heights on which it grew, destroyed hundreds of the natives, unaccustomed to the changes of temperature consequent upon such pursuits. But this cause cannot be operating *now*, for the divinities of the Chinese have long since consumed the fragrant wood; the natives, therefore, no longer die in the wild solitudes of the sandal mountains. Two other causes of depopulation are still at work; one the emigration of the men to other regions, a thousand being supposed to leave the islands every year for the coasts of South America, and in the whaling ships. This, by itself, would sufficiently explain the decrease in the population; some, however, bring in another agency, and ascribe to the Sandwich Islands' women so heinous a neglect of their children as must fearfully increase the waste of infant life. The language of Sir George Simpson is severe on this head. "Speaking of the mass, the females of the Sandwich Islands are worthy representatives of those of their own sex, who, after Cook's death, witnessed with indifference from the ships the slaughter of their countrymen and friends. To say nothing of such things as infanticide, the mothers of the Sandwich Islands indulge in the lesser abominations of *exchanging* children, and of allowing pet puppies to share Nature's food with their own offspring. So far from wondering at the numerical deficiency of the rising generation, we ought rather to be surprised that there is a rising generation at all in a country where women regard their own infants and those of others with equal affection, and lavish on either far less of their fondness than on the progeny of one of the lower animals." What a terrible picture is this for us to contemplate, who have been in the habit of regarding those islands as the most favoured scenes of the Christian missionaries' labour! We cannot avoid suspecting that Sir George Simpson is far too sweeping in his assertions respecting the *present* moral state of the women, and that he has rather drawn his description from things as *they were* twenty years ago. If his account be true with respect to the existing condition of the Sandwich Islands, then have our congratulations been too early and indiscriminate. Our author does, however, intimate his hope of the rising of better times. "The woman have exhibited," he says, "far brighter and more numerous proofs of that change of heart which is the single end and aim of pure Christianity." Still, he cannot help sounding again the knell of the whole population at some approaching period. "Viewed *by itself*, civilisation has been, and still continues to be, a canker worm to prey on the population of the group. There is something truly deplorable in the reflection that in this Archipelago civilisation is sweeping the aborigines from the land of their fathers, without placing in their stead others better than themselves. If there be any truth in the preceding paragraphs, the principal measure for preserving the native population appears to be the elevation of the female character. Now, there are only two instruments by which this elevation can possibly be effected—Christianity and public opinion." It is a sad scene in the history of human progress when a newly discovered people, instead of being added to the old family of nations, is gradually annihilated by a host of sinister influences. We may hope, however, that the natives will soon become so completely identified with the English race, that their decay may be arrested before it passes the critical point.

This amalgamation has proceeded to a great extent, and the increasing prevalence of our language must

tend to bind the natives more firmly to us. English is destined ere long to be the vernacular tongue of the group. It must advance as civilisation advances, and the more rapidly the better; for nothing else is so likely to promote that amalgamation of the European and Polynesian races, which can alone prevent the aborigines—if they are at all rescued from the decay that threatens them—from sinking into the condition of “hewers of wood, and drawers of water.”

Sir George Simpson blames the missionaries for continuing to support the use of the Hawaiian language, and so raising up a barrier to a freer intercourse with the knowledge and civilisation of England. His objections seem sound; but into this point we cannot enter. Perhaps it may receive some attention from the directors of the Sandwich Island Mission. The old native dress has been in most cases laid aside, and the reader who remembers the accounts of the former savage dress—the *malo*, the *pau*, the *kapa*, and the war-cloaks—would be rather surprised were he to arrive suddenly in Honolulu on a Sunday, and see not only shoes and stockings, but a crowd of bonnets and parasols on their way to church. These brown ladies have a decided liking for gay attire,—a satin bonnet trimmed with lace, or a bright coloured silk dress, being especially coveted. This tendency gives the missionaries no small trouble, as they feel bound to oppose the indulgence of such luxuries. The preceding remarks, he it observed, refer principally to the dress of the women; as to the men, many of them keep to the garb of their ancestors. Some of the qualities of these Sandwich Islanders are highly estimated by those who know the people best, and Sir George Simpson, speaking of their courage, says: “They are, without exception, the most valiant of the Polynesians, being perfect heroes, for instance, in comparison with the natives of the Society Islands. In short, with their fidelity and courage combined, the Sandwich Islanders, if officered like our Eastern sepoys, would make the finest soldiers of colour in the world.”

The love of the natives for excitement, finery, and show, is thus hit off:—“In promenading, certain days of the week take the shine out of others. For instance, Tuesday, as every body washes every thing on Monday, brings out the belles like so many new pins, with gowns as clean, and smooth, and stiff, as starch, and irons, and soap, can make them; while the fair wearers, that all things may be of a piece, generally embrace the same occasion of making their fresh wreaths and garlands. For these reasons, Tuesday is a stranger's best opportunity for obtaining a full and complete view of the beauties of Honolulu, for, though never very prudish, yet they are now peculiarly ready to appreciate and return the compliment of being the observed of all observers. Saturday, again, has its own proper merit, inferior to Tuesday in point of show and ceremony, but superior to it in variety and intensity of excitement. On this day, little or no work is done; and all those who can get horses, gallop about from morning till dusk, in the town and neighbourhood, to the danger of such as are poor enough, or unfashionable enough, to walk.”

The reader will not, perhaps, be surprised to find this Polynesian state possessed both of a navy and army; the former consisting, not of the old fashioned canoes beheld by Cook, but of armed decked schooners, manned by native seamen; and the latter of a militia, trained in the European system. Civilisation has also taught the kings the art of extracting a fixed revenue, one item of which is a poll-tax on all above fourteen, at the rate of a dollar for a man, of half a dollar for a woman, of a quarter of a dollar for a boy, and of the eighth of a dollar for a girl. Besides this, a labour poll-tax is exacted from all the men, at the rate of six days' labour on the public works in every month.

The old paganism of these islands was formally abolished in 1819, by the king Lilo Lilo, without, strange as it may seem, adopting another system. This

is a singular instance of a nation of pagans discarding their ancient gods from a pure disbelief, caused by intercourse with civilized people, who laughed the idolaters out of their old religion without creating a belief in a fresh system. Thus, the missionaries, on their arrival, found the land open for their operations.

Into the disputes between the French government, the Protestant missionaries, and the natives, we cannot enter: it must, however, be noted, that Sir George Simpson found three Romish priests in Honolulu, where a bishop was shortly expected. He blames the missionaries for this result. “It was they who introduced secular authority as an instrument of conversion, and sanctioned its merciless abuse. It is chiefly their inflexible austerity that has filled the (Roman) Catholic ranks;—it is their unrelenting code of manners and morals, as enforced by pecuniary penalties, that has driven the people to embrace a new faith.” We must remark, in concluding this article, that the situation of the Sandwich Isles fits them to become the centre of Polynesian commerce, being on the direct route from Cape Horn to the northern parts of the Pacific, and in the path from Mexico to China, accessible to both Chinese and Japanese traders, whether going or returning; whilst their secluded position in the midst of the ocean, prevents the possibility of a rival to their prosperity. The group is also so placed as to be in the centre of the three great whaling grounds, that on the Equator, the one near Japan, and the Russian station. From 1836 to 1839, two hundred and fifty-five whalers entered the harbour of Honolulu, of which all, except five, were American or British.

We must now follow Sir George Simpson through a journey across the Old Continent, a track over which Mr. Murray's hand-books of travel would be of little use. When about to plunge into the wilds of Asiatic Russia, our traveller still feels perfectly at home, having no more consciousness of strangeness than if about to take a summer's trip through Cumberland. He scarcely, indeed, looks upon the Russians as foreigners, bidding us see in the Normans the common origin of the people of Queen Victoria and the subjects of the Czar. Russia and England are, therefore, according to Sir George Simpson, two brothers, or, if the grammarians please, two sisters, who, having gone in opposite directions to make their fortunes, meet, with surprise, on the other side of the globe. The importance of the view here suggested will fully justify the citation of the following passage:—

“Before plunging into that colossal empire, whose length is to occupy an almost uninterrupted flight—for journey I cannot call it—of about five months, let me indulge in a brief retrospect of such portion of my wanderings as I have happily accomplished.

“I have threaded my way round nearly half the globe, traversing about two hundred and twenty degrees of longitude, and upwards of a hundred of latitude; and in this circuitous course I have spent more than a year, fully three-fourths on the land, and barely one-fourth on the ocean.

“Notwithstanding all this, I have uniformly felt more at home, with the exception of my first sojourn at Sitra, than I should have felt in Calais. To say nothing of having always found kindred society, I have everywhere seen our race, under a great variety of circumstances, either actually or virtually invested with the attributes of sovereignty. I have seen the English citizens of a young republic, which has already doubled its original territory, without any visible or conceivable obstacle in the way of its indefinite extension; I have seen the English colonists of a conquered province, while the descendants of the first possessors, however inferior in wealth and influence, have reason to rejoice in the defeat of their fathers; I have seen the English poets that stud the wilderness from the Canadian lakes to the Pacific Ocean; I have seen the English adventurers, with that innate power which makes every indi-

vidual, whether Briton or American, a real representative of his country, monopolising the trade, and influencing the destinies, of Spanish California; and, lastly, I have seen the English merchants and English missionaries of a barbarian Archipelago, which promises, under their care and guidance, to become the centre of the traffic of the east and west, of the new world and the old. In seeing all this, I have seen less than the half of the grandeur of the English race.

"How insignificant, in comparison, are all the other nations of the earth, one nation alone excepted! With the paltry reservation of the Swedish Peninsula, Russia and Great Britain literally gird the globe, where either continent has the greatest breadth, a fact which, when taken in connexion with their early annals, can scarcely fail to be regarded as the work of an especial Providence. Hardly was the Western Empire trodden under foot by the tribes that were commissioned for the task, from the Rhine to the Amoor, when He, who systematically vindicates his own glory by the employment of the feeblest instruments, found in the unknown wilds of Scandinavia the germ of a northern hive, of wider range and loftier aim. At once, as if by a miracle, a scanty and obscure people burst on the west and the east as the dominant race of the times; one swarm of *Normans* was finding its way through France to England, while another was establishing its supremacy over the Slavonians of the Borysthenes; the two being to meet in opposite directions at the end of a thousand years.

"It is in this view of the matter that I have in these pages preferred the epithet *English*, as comprising both British and American, to the more sonorous form of Anglo-Saxon. The latter not only excludes the true objects of Divine preference, but, also, in excluding the Normans, it loses sight of the co-operation of Russia as the appointed auxiliary of England in promoting, perhaps by different means, the grand cause of commerce and civilisation, of truth and peace. Even the very difference of language, while it practically makes me a stranger, serves to confirm my deductions.

"In addition to the permanent conquests already mentioned, the Normans, as a mere episode in their history, rivalled Grecian and Italian fame on the soil of Italy and Greece, and yet, though uniformly victorious in all the climes of Europe, they were never numerous enough to engraft their own speech on that of those whom they subdued. This unparalleled success cannot be otherwise explained than by believing that the Normans were everywhere strengthened by the Almighty to accomplish the universal purposes of his omniscience."

Sir George Simpson arrived at Sittra, from the Sandwich Islands, on Easter Sunday, the 18th of April, according to the Russians, who obstinately keep to the old style, thus being always twelve days behind the rest of Europe. Easter is a great festival throughout Christendom, but the Russians are perhaps the most determined, if not the most refined, in their hilarity; a result which doubtless arises from the exceeding rigour of the six weeks' fast preceding the celebration of the Resurrection. There is sometimes a coarseness in the mere animal festivities attending such festivals amongst a rude people, though in this respect the Russians do not stand alone. "From morning to night, we had to run a gauntlet of kisses. When two persons met, one said, 'Christ has risen,' while the other replied, 'Yes, surely he has risen,' and then came the salutations, some of them certainly pleasant enough, but many of them, even when the performers were of the fair sex, perhaps too highly flavoured for perfect comfort. In plain truth, most of the dames of the village had been more liberal of some other liquids than of clean water."

The grandeur of the event commemorated on such a day is certainly in strange contrast with the intoxication of the celebrants; but we must not exult on this point; our Easter wakes and Whitenside revels might furnish similar cases for the animadversion of a foreigner. The

rigour of the Lent fast, and the consequent natural excesses, are thus described.

"With respect to Lent in particular, not only the priesthood, but also the laity, exhibited the greatest strictness, not *shamming* on beef, like the Californians, but really fasting according to rule." Of the *superior* Russian clergy placed in this remote part of the world, Sir George Simpson held a high opinion, attributable, doubtless, to his intercourse with the Bishop of Sittra, of whom he thus speaks. "On taking leave of this worthy prelate, I cannot refrain from rendering a small tribute of praise to his character and qualifications; and, as he is still in the prime of life, I trust that his widely-scattered flock may long enjoy the benefit of those powers of mind and body which combine to fit him for his important and arduous charge. His appearance impresses a stranger with something of awe, while, on farther intercourse, the gentleness which characterises his every word and deed insensibly moulds reverence into love; and, at the same time, his talents and attainments are such as to be worthy of his exalted station. With all this, the bishop is sufficiently a man of the world to disdain anything like cant. His conversation, on the contrary, teems with amusement and instruction, and his company is much prized by all who have the honour of his acquaintance."

The policy of the Russian government in religious matters shames our statesmen, who have so frequently neglected the spiritual interests of the most important colonies, thus weakening the ties which should ever link remote dependencies to the mother state.

"The presence of a bishop, and a complete body of ecclesiastics in this corner of the empire, is merely in accordance with the long tried policy which has amalgamated so many uncongenial tribes into a compact people, by means of one law, one language, one faith,—a policy which England, perhaps through the freedom of her institutions, has too much neglected. Through this policy, Russia, though apparently the most unwieldy state on earth, is yet more decidedly one and indivisible than any other dominion in existence, as is more than proved by the fact, that a single one of the three principles of cohesion which cement her parts into a whole, vests in her an almost direct sway over the foreign professors of her creed."

The religion of the vast majority of the Russians is more surrounded with ceremony than that of the Roman Catholics, and the highest veneration is always manifested towards every symbol of an ecclesiastical character. A circumstance of this kind led Sir George Simpson and one of his friends into a laughable mistake. A female servant was always observed, when she entered the sitting room, "to bow down to the ground at every step, crossing herself reverentially. Whether she meant to exorcise him, or worship him, or, in default of a cap, to set her rosy cheeks at him, he could not tell; but by means of signs he kept entreating her not to trouble herself on his account. In spite of my maturer years, the pretty maiden behaved towards me in the same extraordinary way; and, what was far more mysterious, she still continued, when I slipped away to try her, to rehearse her obeisances before the empty chair."

"While I was speculating on her proceedings, I happened to cast my eyes on the grim visage of an image which occupied a niche in a dark corner of the room, behind the position which I had just left. The bubble was now burst, and my young predecessor was, of course, mortified to find on my return to head quarters, that the maid's conspicuous attentions had been directed over his head to a musty old saint."

Such reverence for the externals of religion may be of great service in the management of a rude people, whose feelings would be little affected by a higher species of teaching.

Leaving Sittra, the traveller sailed direct for the southern point of Kamtschatka, which, though it possesses an area as extensive as the surface of the British

Iales, and lies in the same latitude, can but just feed its miserable population of four thousand persons. Keeping on through the land-locked and shallow sea of Ochotsk, Sir George Simpson reached the town which gives a name to this sea. This is a station of the Russian Fur Company, and was a few years since a penal settlement. The eight hundred inhabitants of Ochotsk, have, it must be admitted, few facilities for studying the beauties of the landscapes, for "a more dreary scene can scarcely be conceived. Not a tree, and hardly a green blade, is to be seen within miles of the town; and in the midst of the disorderly collection of huts, is a stagnant marsh, which, unless when frozen, must be a nursery of all sorts of malaria and pestilence. The climate is at least on a par with the soil. Summer consists of three months of damp and chilly weather, during great part of which the snow still covers the hills, and the ice chokes the harbour; and this is succeeded by nine months of dreary winter, in which the cold, unlike that of more inland spots, is as raw as it is intense. In summer, in fact, nobody goes out of the house without necessity. If the weather be fine, then the noxious vapours of the stagnant marsh are to be dreaded; and if the weather be not fine, then the rain and wind are to be avoided. In winter, again, the cold is too severe for much exposure, being of that raw, damp, disagreeable kind, which no clothes can keep out."

At Ochotsk, the long overland journey to St. Petersburg begins, being performed partly on horseback, and partly in the boats of the Lena. Neither four-horse coaches nor railway engines offer their services to convey the traveller; but the richer natives keep large caravans of horses, and with one of those drovers named Jacob, a petty prince of the Yakuti tribe, Sir George Simpson contracted for a conveyance to Yakutsk in eighteen days. Some of these caravans present a singular spectacle, when six hundred horses, laden with valuable merchandize, pass in long file over the solitary wastes. The horse may indeed be said to be the life of the Yakuti. "The horse is to the Yakuti, what the walrus is to the Aleutians, their best friend in a great variety of ways. Besides being sold for a price, his labour earns money for his owner; his flesh is used as food; the hides of the inner part of his thigh make water-proof boots, while the rest of his skin is formed into cap, shirt, and trousers; and lastly, as we have just seen, his mane and tail become the means of drawing fish out of the water."

The traveller found his title of "Governor," the highest in those regions, of essential use. "Our military guardian, who rode on a-hed, had represented us as very great men indeed, in spite of our plain clothes; everybody was more obsequious than words could tell. The commissary, who met us in full uniform, talked to us for half an hour, uncovered in the open air, while all the subordinates doffed their caps at least a hundred yards before they reached us." At length, after seventeen days hard riding, the party entered Yakutsk, the capital of Eastern Siberia, and the monument of Cossack valour and perseverance,—for Russia owes Siberia to the daring courage of a Cossack chief in the sixteenth century. This rude soldier of the Don, who thus opened Western Asia to Europe, was named Yermac, and a monument in the ancient city of Tobolsk preserves the memory of his deeds. Far around Yakutsk stretches a lonely region, the dreary monotony of which is only broken by the footsteps of the hunters and ivory seekers. Whence does this ivory come? no animal is destroyed to enrich civilized man with the precious substance, for the bones of huge fossil creatures, of the extinct mammoth species, cover the plains of Eastern Siberia.

"Providence had seen fit, in some distant age, to deposit in the very coldest region on the face of the globe, an inexhaustible supply of an organic substance, which all previous experience would have expected to discover only in tropical climes. The bones of the

mammoth were found in the greatest abundance throughout all the north-western parts of Eastern Siberia. Spring after spring, the alluvial banks of the lakes and rivers, crumbling under the thaw, give up, as it were, their dead; and beyond the very verge of the inhabited world, the islands lying opposite to the mouth of the Yana, and, as there was reason for believing, even the bed of the ocean itself, literally teemed with these most mysterious memorials of antiquity." How such bones were scattered over these wastes we cannot stop to inquire, for such a course would lead us within the fascinating circle of geological speculation. Yakutsk is a striking illustration of the effects produced by human wants and human industry; for this city of the waste is wholly dependent on the trade in ivory and fur, which are sold at a vast annual fair, whither troops of dealers flock from all parts of Siberia and Russia.

From Yakutsk Sir George Simpson departed for Irkutsk, the party being conveyed in boats up the magnificent river Lena, which is six miles wide at Yakutsk, though it is there eight hundred miles from the sea. The route ran through the countries of the Yakuti and the Tungust, two Siberian tribes, of which the latter are the most determined and courageous race. The total number of the Yakuti is estimated at somewhat less than 250,000, which, being spread over an immense tract, are but lonely dwellers in a desolate land.

In Yakutsk are about four hundred houses, seven churches, a monastery, an hospital, and a barrack. The varieties of the temperature in different seasons at this place are astonishing. "The extreme temperature of either season is almost incredible. The thermometer has stood in the shade at thirty-three degrees of Reaumur or one hundred and six degrees of Fahrenheit, while it has fallen in due time to fifty-one degrees of Reaumur or eighty-three degrees of Fahrenheit below zero, the difference being one hundred and eighty-nine degrees of the latter standard, or nine degrees more than the whole distance between the freezing and the boiling points of water." The sub-soil is subjected to an eternal frost. "During the whole year the cellars are said to be in a frozen state, and the wells to send up newly formed ice, for the heat of the summer, excessive as it is, never lasts long enough to dissipate the effects of winter, to a depth of more than two or three feet." "There is, on the whole, little reason for doubting that the ground is frozen to an immense depth; for under the uppermost yard, the frost never loses in summer what it has gained in winter; even the ice of the sea, subjected as it is, every summer to the action of the sun and the water, grows thicker from year to year, the first winter producing about ten feet, the second about five, and so on."

The Cossacks are the great people—the nobility, in fact, of these regions—one of whom it is generally necessary for a traveller to have in his train, to rouse the indolence of the natives, or quicken the zeal of postmasters. This the Cossack is always ready to do by the summary application of his whip to the offender's body, a chastisement which the victim receives with due contrition, calling the castigator "his worship." The following little scene on the banks of the Lena, will illustrate the above remarks.

"Next day, being our seventh from Bostach, our Cossack gave us a specimen of his summary discipline. As the progress of the boat was not equal to the desirability of his temper, the man of office went ashore in a small canoe to quicken the pace; and having made six of the miserable drivers, Russians and Yakuti, dismount at the word of command, he belaboured them in turn with a thick stick, apparently distributing his favours with impartiality. The unresisting wretches seemed to feel the wanton outrage far less than ourselves; they took the whole thing, in fact, as a matter of course. They were, perhaps, conscious of having in some degree deserved what they got; and I certainly

found, as Captain Cochrane had found before, that, under the system of corporal chastisement, the people had become so degraded as hardly to appreciate, at least within the limits of a traveller's patience, the force of any other motive." After a twenty days' voyage up the stream, Sir George Simpson found carriages waiting for him at a place bearing the musical name of Figolofskaya, whence he travelled to Irkutsk, over the Bratsky stoppe along a "whirling, jolting, thumping road." This city, though presenting signs of magnificence and wealth, and having a population of 20,000, gave, nevertheless, proofs of decay; the wide streets being almost deserted, and many of the houses tumbling into ruins." Want of space prevents us from following the governor to Lake Baikal, to which vast inland sea he made a visit before leaving Irkutsk, and for the same reason, we can but glance at his journey of 4,000 miles, from Irkutsk to St. Petersburg. He was now accompanied by an officer of police, to secure all necessaries for the journey, and therefore dashed along to Tomsk, a flourishing town on the Tom, having a population of about 20,000. Thence he crossed the vast Barabinsky steppe with the utmost speed, fearful of being caught, like Napoleon, by the winter. So rapidly did he advance, and so readily were horses provided at the post-houses, that he was amazed at the unusual alacrity of the people. "The secret soon oozed out; our friends a-head, as much, perhaps, for their own convenience as for our glory, had insinuated that I was an ambassador from the Emperor of China to the Czar; while the simple peasants, according to the natural growth of all marvellous stories, had, of their own accord, pronounced me to be the brother of the sun and moon himself, pushing on to the capital with my interpreter and mandarins, in order to implore the assistance of the Russians against the English. Private accommodations were prepared for us at every station, and we were decidedly the greatest men that had ever been seen to the east of the Uralian mountains. As the roads were excellent, we enjoyed the joke, whirling at the rate of twelve or fifteen versts an hour."

With such helter skelter driving, the whole party reached Tobolsk in nineteen days from leaving Irkutsk. The author here takes a review of the history of Russia in Asia, the deeds of the Cossacks, the trade with China, and the gold mines of Siberia, which are the richest in the world. But, for all these digressions, we must, unwillingly, refer our readers to the book itself.

Moscow and St. Petersburg, through which his journey now lay, are too well known to need remark here; it is only necessary to say, that Sir George Simpson reached England in safety, having performed his voyage round the world in nineteen months and twenty-six days.

Such travels undertaken by judicious and influential men, like Sir George Simpson, would soon open channels for that intercourse of nation with nation, which would, in the end, unite the world in one great family, and promote the civilisation of all people.

W. D."

HENRI DE NEMOURS;

OR,
FRATERNAL AFFECTION.

THE French people having in 1789 taken possession of the Bastille, that ancient state prison, where so many political crimes had been committed, where such fearful vengeance had been summarily and secretly executed, the whole edifice was ransacked, and totally destroyed. On that occasion, a great iron cage was found, which proved to be that in which the Cardinal de Baluc, minister of Louis XI., had expiated for eleven years the atrocious guilt of being the inventor, but for other victims, of the instrument which thus served for his own punishment. In another dungeon was discovered a second iron cage, smaller, in the shape of a bowl, wide at

top, and terminating at the bottom in a point so narrow, that any one shut up in it could neither sit nor lie nor stand upright. The last mentioned cage was the only one now remaining, of two, which had served, three centuries before, as the prison of two young princes, Henri and François de Nemours, sons of Jacques d'Armagnac, who in the reign of Louis XI. was Constable of France. It is well known to any who have read French History, that d'Armagnac had leagued with the Dukes of Burgundy and Brittany (Bretagne) to deliver up France to the English. This plot, which would have snatched the sceptre from the hands of the French monarch, was discovered to Louis when just ripe for execution, and Jacques d'Armagnac was instantly arrested, and sentenced to be beheaded. He had two sons so young at the time of his treason and its punishment, that when these poor children were asked if they had not been the accomplices of their father, they might have answered with the lamb in the fable: "How could I, when I was not born?" Nevertheless, by a refinement of cruelty, which even the barbarism of the age cannot palliate, much less justify, Louis XI. ordered white robes to be put on the two boys, and thus attired, they were placed under the scaffold on which their father was standing, and when he received the fatal blow, the executioner sprinkled the white robes and their innocent heads with the blood of the criminal. Nor was the vengeance of Louis satiated by the punishment of the Constable. The two orphans, dyed in a father's blood, were taken to the Bastille, dragged to the subterranean dungeons, and there put into the two iron cages described before. Henri de Nemours was then eight years old, and his brother François very nearly seven.

The unhappy children, thus condemned to continual torture, had no other consolation but putting their hands through the bars of the cages to grasp each that of the other. And all day long, and all night long the young brothers were hand in hand.

François, the younger of the two, was the most desponding. "I am so much hurt here," said he, "surely we cannot live long this way." And he wept.

"Come, come," replied Henri, "a pretty fellow to cry at your age; besides you know papa never liked that we should cry. You see they are treating us like men of whom they are afraid, so we must not behave like children. Instead of crying, let us talk of poor dear mamma."

And then the poor victims of the cruel policy of Louis XI. talked of days gone by, and of the beautiful domain of Loctour, where they had passed the first years of infancy. Once again did they climb their own hills of Armagnac, once more wander in its thick woods, once more run races in the broad walks of the baronial park. But alas! it was only in imagination—yet the young prisoners found a momentary oblivion of their sufferings in that blessed magic of memory which makes the present cease to exist for us, by bringing us back into the past.

One other slight alleviation to their wretchedness was afforded to these infant martyrs by a very little mouse, which, having crept out of its hole one day, was at first so terrified by the sight of the young princes, that it ran back as fast as possible to its hiding-place. In vain did the children try to coax it; it was not till the next day that, pressed by hunger, she ventured out to pick up some of the crumbs which they had purposely let fall from the cages. By degrees, however, she became accustomed to the voices of the children, and a few days after her first appearance, she grew so tame, that she climbed up to the cages of her patrons, and at length used to go from one to the other, and eat out of their hands.

But it was a small thing to the vindictive Louis that the blood of d'Armagnac had stained the fair hair and white robe of his children. He heard that the two little prisoners of the Bastille were enduring their

sufferings with fortitude, that, through custom's wandrous power they had learned to sleep soundly in their iron cage, nay, even to awake with an almost cheerful "good morrow" on their lips. He heard it—can any heart that responds to one human feeling believe that it but impelled him to devise fresh torture for them? He issued orders that a tooth should be extracted every week from each of the children.

When the person appointed to this office, a man too long accustomed, as the minister of the king's savage cruelty, to the sight of suffering, to shrink from inflicting it, was introduced into the dungeon, he could not suppress an exclamation of pity at the spectacle of the two unhappy, yet patient little creatures. He was, however, obliged to tell the object of his visit, and when the brutal order of the king was announced, the little François uttered piercing cries, and Henri endeavoured to plead with the executioner. "Mamma," said he, "would die of grief if she heard of my little brother suffering so much. Oh! pray, Sir, spare him—I entreat of you not to put him to such pain; you see how weak and ill he is already."

The executioner of the king's cruel purpose could no longer restrain his tears. "There is no alternative," he said, but he sobbed as he spoke, "I must obey; I risk my life even by delay. My orders are to hand the two teeth to the governor of the Bastille, in order that he may lay them before the king."

"In that case," said Henri, "you must only take two from me. I am strong and can bear it, but the least additional suffering would kill my brother."

And now a long and touching contest arose between the children as to which should suffer for the other. Surprised and affected, the man hesitated for a few moments, and might, perhaps, have finally yielded to the dictates of pity, and have shrunk from executing his revolting office, had not a messenger come from the governor to inquire the cause of his dilatoriness. The messenger knew that longer delay would be regarded as a crime—he approached Henri and extracted a tooth: the child repressed every expression of pain, and seeing the man moving towards his brother's cage, he cried, "Stay, you are to take another from me—you know I am to pay for us both." And the heroic child obtained his wish, and his self sacrifice gave to the governor of the Bastille the two teeth he was required to lay before the king.

The cruel order was executed in its utmost rigour; every week the minister of his barbarous will repaired to the dungeon, and every week Henri paid his own tax and that of his brother. But the strength of the noble boy was at last exhausted; a violent fever raged in his young veins; he gradually grew weaker, and his legs being unable to support him he was obliged to kneel in the cage. At length a day came when he felt that he had only a few minutes to live, and making a feeble effort to extend his hand once more to his brother, he said, "All is over, François, I shall never see mamma again, but, perhaps, you may yet be taken out of this horrible place. Tell my darling mother that I often spoke of her, and that I never loved her so much as now that I am dying. Farewell, François," gasped he, as his breath failed him, "you will give our poor little white mouse her crumbs every day. I depend upon you to take care of her; will you not, dear François?"

He heard not the answer of his brother, death snatched him from his sufferings, and he passed into that place "where the wicked cease from troubling and the weary are at rest." It may be presumed that Louis was softened in favour of the last of the Nemours, for, after the death of Henri, François was released from his iron cage and transferred to one of the ordinary dungeons.

At length the soul of the cruel monarch was required of him, and the reign of Charles VIII. began. His first act was to set at liberty all the victims of the suspicious and hateful policy of Louis XI. Among the rest, François de Nemours was released, permitted once

more to behold the sun, once more to lay his drooping head on the bosom of his mother; but the torture he had undergone in the horrible cage left him all his life lame and deformed.

AN INCIDENT AT SEA.

For the first few days our voyage was remarkably prosperous; our ship, the barque *Robert*, of some 800 tons, was well found; her captain, an experienced hand, had been in the West Indian trade for upwards of twenty years, and the crew were as fine a set of men as could be desired; all hardy and thorough-going seamen. It was towards the end of February, and the weather had been for some days dry and open, with the wind at due east. We had a famous run down the channel, and were well clear of the Bay of Biscay on the fifth day, fully calculating to make Madeira on the twelfth.

However, the rapid falling of the glass, and certain atmospherical indications, led us soon to expect a change in these prospects, nor was it long before it was realized. Every thing had been done, in anticipation, to make the ship snug, by lowering our lighter spars, reducing the sails, and by shaping our course so as to have an abundance of sea room, so that, in fact, we were well prepared for the worst. The wind had entirely dropped, and the sails flapped heavily against the masts, as the ship rolled and pitched under the influence of a long and uneasy ground swell; the sun set angrily, and a low moaning sound, as of wind, created a feeling of discomfort, which was not allayed by an observation of the captain, that we should "catch it before morning."

I had retired to my berth, but I could not sleep, and so much from positive apprehension as from that fever of doubt which is more distressing. I soon felt that the captain's prognostication was about to be realized; the whistling of the wind through the rigging sounded like funeral wailings; the creaking of the masts, the straining and groaning of the bulk-heads, as the ship laboured in the weltering sea, were frightful. As I heard the waves rushing along the side of the ship, and roaring in my very ear, it seemed as if death were raging round the floating prison, seeking for his prey; the mere starting of a nail, the yawning of a seam, might give him entrance. Suddenly I was alarmed by the loud cry of the watch, "A sail ahead!" I was on deck in a moment, and saw distinctly a small schooner close a head of us, with her broadside towards us; escape was hopeless, we struck her just a mid-ships. The force, the size, and weight of our vessel bore her down below the waves, we passed over her, and were hurried on our course. As the cracking wreck was sinking beneath us, I had a glimpse of two or three wretched-looking beings, who, with frantic gestures for help, and shriek of terror, were swallowed by the waves. I heard their drowning cry mingling with the wind, as the blast that bore it to my ear swept us out of all further hearing. I shall never forget that cry! It was some time before we could put the ship about, she was under such head way. We returned, as nearly as we could guess, to the place where the schooner had gone down; we cruised about for some time, and fired several guns, listening through the gale if we might hear the halloo of some survivor, but all was silent; we never saw nor heard any thing more of them.

The storm increased with the night. The sea was lashed into tremendous confusion. There was a fearful, sullen sound of rushing waves and broken surges. Deep called unto deep. At times the black volumes of cloud over head seemed rent asunder by flashes of lightning, that quivered along the foaming billows, and made the succeeding darkness doubly terrible. The thunder boomed and bellowed over the wild waste of waters, and were echoed and prolonged by the mountain wave. As I saw the ship staggering and plunging among those rearing caverns, it seemed miraculous that she regained

her balance, or preserved her buoyancy. Her yards would dip into the water; her bow was almost buried beneath the waves. Sometimes an impending surge appeared ready to overwhelm her, and nothing but a dexterous movement of the helm preserved her from the shock.

Morning at length broke, but the gale was unabated, and, with the exception of a mere storm stay-sail, we were scudding under bare poles. Heavy, leaden clouds hung like a dome over us, while a lighter fleecy scud was borne, as if on wings, beneath them. The aspect without was not cheering, and within it presented nothing but discomfort; the dead lights had been shipped, making the cabin, wet and slimy from the seas we had shipped, still more cheerless. For three days did this state of things continue, and we were driven helplessly along, our bulwarks stove in, our boats dashed to pieces, and leaving mere fragments hanging to the davits; the caboose gone, and the decks completely cleared. On the morning of the fourth day the weather moderated slightly, and the captain ventured to get a trysail set; but we were occasionally struck by some frightful seas, and many a time were the men saved by a life line.

I was, however, less fortunate, for a mountain wave striking us abaft the mizzenmast, knocked down the man at the wheel and carried me overboard with resistless force. Fortunately, I was immediately missed, and as I rose on the top of a sea, on which I was labouring, after having recovered from the first plunge, I was caught sight of. My shoes were soon kicked off, but my jacket, clinging to me from the wet it had imbibed, resisted all my efforts to strip it off. I felt that my chance was a small one, though not hopeless, for I had ingratiated myself with the men, and the captain was a fellow-townsmen, and, therefore, I was persuaded that they would use every effort to save me; but, at the same time, I feared that they might not dare to wear the ship amidst so much danger. A moment's reflection convinced me that it would be useless to fatigue myself by swimming, and that my only chance lay in husbanding my power, by keeping myself collected, and by floating with the least possible exertion. I was soon far, far astern, anxiously watching the receding ship, when, borne to the crest of a giant wave, I caught a momentary glimpse of her; and I must confess, that when I was carried down again into the deep trough of the waves, I was assailed with the most painful qualms as to the possibility of succour being afforded to me in such a sea. Minutes seemed lengthened into interminable hours, but still I floated on, sometimes "carried up to heaven, and down again to the deep; my soul melting away because of the trouble." The sight of the ship always cheered me, and I waited anxiously for the wave that would bear me up and bring her within view, as it dispelled for the instant the dreadful feeling of desolation which oppressed me as I lay in the hollow seas. These snatches of her were so momentary that I could form no idea whether any change had taken place in her position, yet once I thought I saw her broadside to me, and my heart bounded with delight; I hugged the idea, although the next glance at her did not bear out my hopes. Yes! it was no mistake; the distance between us was lessening, and they had succeeded in wearing the ship. But fresh doubts grew upon me; our positions were altered by the course she was forced to take to bear down upon me, and as I was sure that they could not have seen me for some time, they could neither tell where I was, whether I survived; and then I thought they might miss me, and I knew my voice could not be heard; and then I began to calculate as to the utility of further exertion on my own part, and how much longer I could keep myself afloat. The look-out was, however, most vigilant, and a couple of men had stationed themselves in the fore-top to gain a wider field, and by them I was discovered. The course of the ship was shaped to me, and as she passed within a few yards,

a plank with a line attached to it was thrown overboard. I soon reached it; and, clinging with difficulty to it as it pitched and rolled, I succeeded in making the line fast beneath my shoulders. A loud shout from the ship proclaimed the delight of the crew, who began hauling me towards them with a good will that left me little to complain of beyond the stifling sensation of being dragged rapidly through the water, and the pain of the rope across my chest. Luckily they understood my signal, as the two latter causes prevented my speaking, and hauled me in over the stern, for in their zeal they would have pulled me up the side of the ship, against which, as she rolled and surged, I must infallibly have been killed. The congratulations of all the hands were most sincere; they refused all rewards, and would accept nothing but my thanks; they said they had given me up, being certain that no man could have kept himself afloat amidst such heavy seas for the hour and a half I had been exposed to them. We had a glass of grog all round; and, after I had changed my clothes and spent a short time in my cabin, I could have fancied the whole had been a dream, but for a painful stricture across the chest, which lasted for some days. In a week we were at Madaira, where we refitted before we proceeded on our voyage to the West Indies. E. P. T.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE SUMMER IS OVER.

[* * * * *]

THE Summer is over,
Too soon it is sped,
Its joys scarce returning
Before they are fled.
The leaves that once shaded
Our pathway, are o'er,
And the flower that is faded
Will blossom no more.

But past joys in remembrance
Still dwell in the heart,
Like the scent of sweet flowers,
They do not depart;
And the Robin is singing
Still on the bare bough,
A glad message bringing
Of joy even now.

Though the lost sun no longer
Shines through the long day,
And the leaves and the flowers
Are faded away:
Though the warm winds of even
No longer blow soft,
And the bright stars of heaven
Look cold from aloft:

Still, still in the bosom
Shall joy find a home,
And the heart shall look forward
To pleasures to come,
And the soul shall still cherish
Glad hopes of the Spring,
When the flowers shall all flourish
The birds shall all sing.

THE MEANING OF UNDINE.

"THE meaning of Undine!" We fancy we can see the air of scornful disgust wherewith some readers will close the book when this obnoxious title meets their eyes. It is strange with what a natural antipathy to the allegorical some persons are born; it is unto them as "a gaping pig, or a harmless, necessary cat;" they scent it at the distance of miles, and close their doors hastily, lest their thresholds should be polluted by its passage. They resist its interpretations as a species of torture, a *peine forte et dure* inflicted upon helpless authors by inquisitorial critics, constraining them at length, however innocent, to confess themselves guilty of the meaning imputed to them. And truly, when we recall the afflicting exercises of senseless ingenuity which have annoyed this country under the name of allegory and allegorical interpretation, we cannot be greatly surprised at the horror of a reader of ordinary humanity when he encounters the word. We are a people whose nature it is to speak plainly; we deal not in hidden meanings; symbolism in its higher grades and finer texture is a mystery we care not to penetrate. Our literature, when it does venture to commit an allegory, generally works it out in a practical, business-like manner, regularly personifying a certain number of qualities good and bad, carrying them steadily through an appropriate series of evolutions, and setting them finally, with an unobjectionable moral, to live "happy ever afterwards," or miserable, as the case may be. The allegorical meaning, and the story which thinly veils it, are thus kept comfortably distinct, and the reader may occupy himself with either, as the humour takes him, without being obtrusively annoyed by the other. Thus, since the genius of our land seldom assumes the garb, or, assuming it, wears it not easily, it has come under the treatment of a lower class of minds, and fallen into disgrace among us. The inquisitive critic who hunts for a meaning and a message in the poetry of the day (in truth often a hopeless search!) is reckoned, perhaps not unfairly, with the gossip of daily life, who spends his time in attributing motives to his neighbours which it never entered their heads to conceive,—and the judicious reader turns from his "fantastic tricks" with contempt, and never admitting the idea that the absurdities of the monkey counterfeit the dignity of the man, which is, when it can be found, a real, genuine dignity, takes to himself the common, and most attainable comfort of looking down upon that which he cannot understand. He forgets that the heaven which seems to him to lie beneath his feet, is as much heaven—impenetrable, unattainable, incomprehensible heaven—as that which stretches visibly above his head. Nocturnal we can understand; and there is no mistake about the darkness of midnight; but for the pale, shadow-haunted twilight, where the seen is for ever passing into the unseen, where the distance is thronged with phantoms, and the air voluble with sounds that are in the voice of a spirit, speaking to us in no articulate language, yet awakening thoughts by every note of its low music, we have neither eyes nor ears; yet in this strange cloud-land do the Germans live, move, and have their being. We say not that in this they are better off than ourselves; we pronounce no sentence whatever upon the matter; but admitting the fact, (and we believe that, whether in scorn or in love, the fact will generally be admitted,) we ask the candid reader whether there be any hope of his forming a just estimate of the scenery of the spiritual region, if he persists in denying that such a region exists? whether, in short, it is a fair mode of proceeding, to make up your mind in your closet that the Germans shall speak English, and then go out into the street and quarrel with the first *Deutschlander* you meet because he accosts you with a polite "Guten morgen?"

For, let us consider a little. Who, and what, is this

Fouqué, whose writings are now so widely read, so generally admired, and (we beg the public's pardon) so little understood among us? Was he a man who looked only at the outsides of things? receiving them in their external bearings into his mind, and reproducing them in like manner in his art? sometimes hitting by accident upon a truth, resident in the eternal form, and, indeed, inalienable from it; but scarcely perceived, and by no means appreciated by him? Or was he not rather in very deed a poet,—that is to say, (be the word received as it is spoken, in reverence!) in some sense a priest of the Invisible;—a man on whose soul a charge has been laid, in whose heart a word has been spoken, and who must needs acquit himself of that charge, and give utterance to that message as he best could, at all hazards? For this is the true definition of the poet,—though few, very few, attain, or even approach to mastery over their mysterious gift. For the most part they labour and tremble beneath the burthen; speaking, half unconsciously, words which they scarcely apprehend themselves; troubled, dubious, wondering; often absolutely powerless in practice, needing help, guidance, and counsel at every moment; but enabled by a most inexplicable law to shed that light on others which their own darkened and wandering steps need, and cannot find, and grateful with a gratitude which no eloquence can express to those stronger minds on whom they are sometimes permitted to lean for a little while, and by whose aid they are enabled to give body to the vague and vivid ideas which are for ever floating before them! Not of this stamp, however, was Fouqué. He had attained to that higher elevation at which clouds and vapours are a spectacle beneath the feet, and not a difficulty in the path. He had, or believed that he had, the truth within him,—distinct, tangible, imperative. How could he choose but give voice to it? Yet, not as a preacher, observe;—the difference is great and important. His vocation was to teach truth by means of beauty; not dogmatically, and as it is in itself. That beauty became his art, and the very element of his life; but while sporting in it with the buoyancy of a child,—while studying the picturesque and wooing the graceful with his whole heart,—these all became to him, and must become to us, if we would understand him rightly, symbolical;—and were for ever converting themselves, sometimes, perhaps, even to his own surprise, into vehicles for the message which it was given him to utter. It was not that, like common allegory-manufacturers, he wanted to teach one particular doctrine, and set himself to make an allegory to fit it; but that his soul was thrilling and quivering with intense convictions, and that the romance, the fairy tale, the chivalrous adventure, beautiful as they were in themselves, and complete and independent, were but as shadows and garments of the sublimity of Truth. If this view of him be correct, two conclusions must at once be admitted. First, that it would be absurd to expect to find in "Undine" a kind of "Pilgrim's Progress," where every particle has its distinct and unmistakable office, right or wrong, in the working out of the intention of the writer; secondly, that it would be equally absurd (and this is speaking mildly) to consider it as a mere fairy-tale, valuable only for its exquisite originality, and the ethereal beauty of its conceptions,—destitute of deeper meaning, and higher aim. This would be simply impossible to such a man as we have attempted to describe Fouqué. Without, therefore, distorting or degrading this loveliest of fictions, we may allowably look for a living soul to animate the movements of its matchless form. We may expect to find that its general outline is symbolical, and in many of its minor touches we may hope to discover a significance, real and not to be disputed, but appreciable only by the loving student. And it is only to the loving student that these pages are addressed. Him we fearlessly invite to endeavour with us so to tune his heart in accordance with the heart of the great

minstrel, that the notes of this delicious harmony may not speak to thankless silence, but may awaken an echo and an answer, feeble, indeed, but still in unison with themselves.

Far be it from us to attempt anything so rash as a sketch of the great temple which Truth had reared for herself in the mind of Fouqué. Our business is with one little cool and solemn chapel, with its delicate sculptures, and mellow many-tinted light; bearing, doubtless, its relation to the whole fabric, and echoing, ever and anon, the choral harmony which swells along the distant nave; and rich in ornaments, whose meaning can be but dimly perceived by one who knows not the symbolism of the entire structure;—but still exquisite and perfect in itself, and capable of being considered separately and for itself. We shall pre-suppose a knowledge of the story of Undine in our readers, which will enable them to follow us through the few remarks which we are about to offer; and, ere we begin, we would once more earnestly entreat them not to object to us the very fact on which our whole theory of the German genius rests—namely, that there are scenes and parts of scenes which cannot be fitted into one plan, and that the various characters frequently talk and act inconsistently with the principles which we suppose that they are intended to embody. The personality wherewith Fouqué invests his ideas is a real living personality, not an unsubstantial vapour—his story is framed artistically *as a story*—but the prophet-voices from time to time, speak through it, and to these we are about to listen. We protest vehemently against that captious and flimsy judgment, which, when you assert that the child is like its mother, shall answer you by pointing out a difference in the curve of the nostril, or the line of the eyebrow, as though resemblance could not exist unless every line and feature were strictly copied—as though, indeed, it did not really exist rather in expression, gesture, and character, than in bones and muscles.

Nevertheless, we are afraid. Were we to tell the patient reader who has followed us thus far, what the lesson is which we believe that Undine teaches, we assuredly think that he would follow us no farther. We will defer it therefore—we will not announce it at the beginning, but will rather lead to it through the progress of the tale, buoying ourselves up with the fallacious hope that some one or two may perhaps then anticipate us, and utter of themselves the words which we have not courage to speak.

In Huldbrand then—the character for whose especial benefit the story appears to have been constructed, for whose happiness or misery the other personages seem to have been called into existence, we have at starting a mind of great capacities and generous feelings, but utterly undisciplined, moulded and sullied by the world to which it has abandoned itself; without faith, and unconscious of the miserable want. This man knows nothing of the reality of life—he has hitherto done nothing in earnest—he has existed among stage lights and painted pasteboard, and he cares not even to contrast them with the holy moonbeams and majestic forests whereof they are the ineffectual mimicry. He lives in willing and perpetual subjection to the pride of Intellect, and the frivolous enjoyments of the world, (symbolized as we believe by Bertalda,) and he has not, as yet, made one effort to escape from them—nay rather he defies them, and considers them the only good. Suddenly, for the first time, he awakens to a desire after Truth, and begins to seek for it. Not indeed as a penitent, striving humbly, tearfully, and laboriously to return, if it may be, to the bosom of a scorned and forsaken mother, but gaily, and in a spirit of bravado. He has been piqued into making the effort, and he undertakes it without a doubt of victory. Like the French girl in the memoirs of Madame de Staël, he can talk very well of other things, and he will now talk a little of religion.

What befalls him? how does the insulted divinity avenge herself? We shall see. He withdraws for a while from the world, and begins his study in earnest. The act is good, be the motive what it may, and the fruits are immediately apparent. The light, scoffing, satisfied spirit which has hitherto lived only in the present and the visible, wakes up in a moment to a perception of the mystery of life, and the wonders of the world. A finer nature would be appalled and saddened—a higher temper would be transformed and inspired; he is neither the one nor the other. *In pride, not in humility*, he began his task, and in the same spirit he continues,—puzzled, bewildered, it is true, nay, sometimes well-nigh frightened, but still in nowise discouraged. He falls under the scourge of superstition—fit punisher of unbelief: a thousand grotesque and mocking forms crowd around him; a thousand inconsistencies, inexplicable but real, torment him. Evil in her myriad shapes, from the terrible to the disgusting, the mean, or the simply ludicrous, besets him on every hand, and he has no key to her riddles—no defence against her attacks. He cannot escape from her by returning—he cannot become what he was; he has plunged into the dark forest, and he must needs go on ward, till he arrives at light of some sort, whether true or illusory;—he has once discovered that the world is not made up of money, food, and clothing, and there is no rest for him till he has found out, or fancied that he has found out, of what it is really made.

He takes refuge in the religion of nature, and the simplicity of country life. (Now, pray, reader, do not imagine that the dear old fisherman and his wife are purely allegorical; they have a meaning, it is true, in the history of this mind, whose perplexed wanderings we are trying to unravel. But they are in themselves genuine and substantial—simple, untaught, but kindly characters, with whose doings and sayings we may fairly delight ourselves, without straining our eyes to discover in them a mystical double sense which we shall often have to invent for ourselves before we can pretend to detect it.) For a little while the wandering Huldbrand believes that he has found rest; and truly, the merest glimmer of natural religion falling upon the heart, is a relief from the dark, dreary, practical scepticism of the worldling. For the image of God is everywhere, though, alas! defaced and disguised, and it is, if we mistake not, one of the offices of grace to discern that glorious image in all things, and release it from the fetters of sin and garments of falsehood wherewith Satan has been permitted to encumber it. Therefore, to the mere lover of nature, for her own sake, a path is open, if he would but see—a guide ready if he would but follow. Upon this path Huldbrand is beginning to enter, and the first vision which he encounters there is Beauty—the most eloquent of all the voices wherewith God has gifted the earth, that it may utter his praises. But he has now less chance of rest than ever. The bewitching phantom beckons him a thousand ways, and eludes his grasp at every turn, now mocking, now coming, for ever attracting, and for ever unintelligible. He is enamoured of the form, but for him it has no soul; he knows not whence it is; he can discover no rule, and obtain no guidance, but he is subjected to an irresistible fascination, and he knows not whether it is for good or evil. In the system of an undisciplined mind Beauty has neither place, office, nor purpose, but is simply an influence to which he submits for the sake of the pleasure which it bestows upon him; nevertheless this Beauty is of a very different class from that of his former enjoyments—they were sensual, she is spiritual, and the more incomprehensible for that very reason—he cannot recall them while communing with her, little as he is able to understand her, without a sharp and sudden pang, telling him that he must not have both together.

Strange and mysterious is this soulless shape of Beauty to him. He cannot follow her movements, or

guess at her designs: she seems to him wayward and lawless as she is lovely, and when she is loveliest in outward aspect, he is least able to guess what manner of spirit she may be of. Strange is it ever, when the eternal form is the subject of our contemplation, while the spirit which evolved it has passed away, and is undiscoverable. We are reminded of the sentence fearlessly passed, not many years since, upon the grandest of all the shapes which the true spirit of beauty has ever assumed on earth—gothic architecture. That, too, was a form, from which the soul, alas! was absent, and therefore, the men who gazed upon it could discover neither rule whereby to judge, nor principle wherefrom to deduce it. They were oppressed by its vastness—they were offended at its mystery: if the idea was grand, said they, the details were grotesque, meaningless, unpardonable; so they rejected the testimony of their senses, and decided that it was nought.

And it is at this epoch of a man's mental history that he is in danger of falling into the spirit of the Puritans. Angry with this perverse and unintelligible Beauty, he is tempted to ask with the old fisherman, "whether she has really been baptized or not?" whether she be not in fact a fair ambassador from the Evil One?—and then he flings her away altogether, and sets himself to lead a dreary, miserable half-life without her, which would be simply pitiable if it were not the result of pride and impatience. There was no such danger for Huldbrand, though his safeguard lay in his weakness, rather than in his strength. He was not sufficiently in love with Truth to make a sacrifice in the hope of obtaining her; on the contrary, had he made that unhappy, but common mistake of supposing himself called on to decide between Beauty and Truth, (oh, most unnatural divorcement!) he would assuredly have forsaken the latter, that he might cleave to the former. Therefore, he continued to woo, and to chase the enchanting vision without attempting to understand her, without advancing to grasp her, till there came a change,—and here we will begin a new paragraph, and counsel our readers in all charity to part company with us here, unless they be men of mettle, for we intend to go very deep indeed before we have done.

Let us for a moment, refer to the story itself, which in the reader's mind has, we trust, kept pace with our observations. Huldbrand has achieved a certain mastery over the wilful and captivating Undine, without even approaching to a right comprehension of her. The old man and his wife, who, in so far as they influence the mind of Huldbrand, may, perhaps, symbolize nature and prejudice, are as little able to manage her as he is; they are perpetually in trouble about her, endeavouring to restrain her,—indignant at her frolics, yet perpetually returning to love her by an impulse which they cannot explain. There is a great storm. All the elements are in commotion, they cannot agree with each other, or with mankind. Suddenly, there is a low knock at the door,—it is opened, and "they behold an aged priest."

The seeker encounters for the first time the Idea of the Church of Christ,—of the only system wherein Truth is able to reside without parting with some of her lustre; of the only power which conquers all things, not by crushing and annihilating, but by subduing and transforming them. What follows? The place and rule of Beauty is at once found—her form receives a soul, and her union with the soul of man is sanctified. Huldbrand may clasp her fearlessly to his heart; she is now his guardian angel, pure, placid, lofty, and submissive; not mocking him by her caprices, but rather soothing and ennobling him by her constancy: not disdaining the details, and shunning the trials of daily life; but rather leading him among them, and softening them into harmony with herself, as even the hard substantial rock grows transparent in the purple light of sunset. It is true that, for the wayward heart of man, the soulless Undine, with her sweet petulances and

graceful lawlessness, may sometimes be more captivating than the same Undine when the burden of a soul causes her to tremble, to walk warily and softly, and to hide her exuberant fancies under the mantle of a holy reserve; but, though this be true and natural, no one will contend that it is right. It is an illustration of the same law which operates in actual life, making the frank, light, joyous character, which neither seeks nor needs concealment of its emotions, so attractive—the quiet, withdrawing, sensitive temper which lacks the power and the will to express its secret enthusiasm, so repulsive, even to a refined and penetrating observer. But, nevertheless, Undine and Huldbrand have found their home and their rest together, and "whom God hath joined, let no man put asunder."

And here the tale might end: but does it end here? Not so! The *lesson* is yet to come; the wonderful truth and beauty of the conception are yet to be vindicated. Smooth and easy indeed would be the passage from darkness to light, were it such as has been here described. But we are to be taught that the soul which has forsaken truth, and lived among vain shows, and delighted in false and sensual pleasures, finds not Beauty as the appointed angel to lead it softly back to the old path, but must rather seek that way, if haply it may be found, in toil, and tears, and penitence. Beauty is no guide to truth, except for the comparatively innocent: she opens not the gate of the temple, but stands within, ready to bless the faithful and fervent worshipper. The faith which Huldbrand has obtained is indeed pure and lovely, but powerless to influence his conduct; a sweet melancholy voice, full of loving reproof, for ever whispering in his ear,—but the whisper is unheeded, and the voice grows fainter and more mournful, till it dies into a silence yet more reproachful than its words. "This is an 'aesthetic religion,' living in the imagination and the intellect, not in the heart and the life. Pure, spiritual vision of beauty! How camest thou to be wedded to this earthly and trivial soul? Alas, for thee! Thou must needs droop and fade, speaking only a few times through the conscience which thou hast awakened, withdrawing thyself further and further from an intercourse in which every word is a wound, and departing at last, wronged, helpless, and weary—departing, not to return till thou shalt be sought for aright!"

Our space will not allow us to follow out the idea (or what we believe to be the idea) of this latter half of the story, into its minuter expressions. If the reader accept our key, he can use it for himself, and we think that he will wonder not a little to find how exactly it fits, and how many are the treasures which it is able to unlock. A few only of these can we indicate ere we conclude.

How pathetic is the haste with which Fouqué passes over the wrongs of Undine, omitting the details as if too painful to be dwelt upon—lingering upon the feeling which they awaken, in sentences of which every word is pregnant with exquisite meaning. The fickle Huldbrand goes quickly back to his old love, and his old life, carrying with him the bride whom he wooed and won so strangely, but whose presence, lovely as she is, becomes gradually a burden and a reproach. He yields once more to the blandishments of Bertalda,—the pride of life and of intellect, the gross and earthly part of his nature resumes its sway, the pure and imaginative part is shunned and resisted. "Huldbrand and Bertalda," say Fouqué, "were afraid of the gentle Undine, and ashamed before her!" We need not do more than point to the application. But they are not at rest in their sin, so long as that fair and speechless vision stands beside them; strange fears and spectral thoughts encounter them at every turning,—"such," observes Fouqué, "as they had never seen before!" How indeed should they have seen them before? We know not the hideousness of sin till we have begun to see, however dimly, the beauty of holiness. The sad history of degradation proceeds; lower and lower does the unhappy

Huldbrand sink, till Undine herself closes the stream, and sets her seal upon it. Strange and most mysterious state, where the feeble remnant of good within a man leads him to flee from privileges which he knows that he shall abuse, and so convert into judgments! Bertalda resists this; the pride of intellect is not content to be divorced from faith and imagination; she sees not, in her blind self-confidence, that they contain that which will destroy her, but strives to use them as servants, and convert them to her own purposes, and fails, as she ever must fail, in so unhallowed an effort. After this, however, the guilty pair are, for a time, happier; one step more has been taken in the hardening of the heart, which seems not far from its final and hopeless induration. How shall we interpret Undine's piteous entreaty, "that he will not chide her upon the water?" What is that last little safeguard, which, when withdrawn, leaves the sinner to pursue his course unchecked by warning, untroubled by remorse? May it not, perhaps, signify reverence,—that instinctive shame of the soul in the presence of truth, which has in it the germ of repentance and the hope of restoration? However this may be, the final offence is committed—the cup is full—and the guardian angel departs! Undine leaves the faithless Huldbrand, with love and grief in her last farewell.

The loud, uncanny revel of guilt succeeds; and on this we need not dwell. Neither shall we attempt to describe in words the awful beauty of the conclusion, when the rash Bertalda causes the stone to be removed—when some sin more atrocious, some profaneness more glaring, than the habitual sins and profanenesses of the soul, startles the conscience into activity—and Undine returns; returns in her beauty, her sadness, and her holiness; returns in her love, to slay the penitent by tears! So only could they be reunited, so only can we admit a trembling hope for the miserable Huldbrand. But the subject is too solemn to be dwelt on here, or by us.

In conclusion we would say one word upon a part of the story which seems to us deeply significant, but the interpretation of which we offer with some doubt—the origin of Undine, and that of Bertalda. Yet surely it can scarcely be accidental, that Bertalda, whom we have supposed to typify the human part of man's soul, the intellect and passions, is born of nature, and has her natural home upon earth, while the origin of Undine, the pure, the spiritual, the imaginative, is wrapped in mystery. She is no natural product of the heart of man; she is a gift and a revelation, and she is born of water!

And now, reader, if you be weary and indignant, we beseech you to call to mind that couplet of Burns—

"What's done ye partly may compute,
But know not what's resisted!"

For every conjectural interpretation of our author's meaning wherein we have indulged ourselves, we might easily have presented you with ten, and, when you contemplate the alternative, we think you will, on the whole, be disposed to regard us with gratitude.

S. M.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. XII.

LAWLESS'S MATINEE MUSICALE.

I SCARCELY know any excitement more agreeable than driving, on a fine cold day, a pair of spirited horses, which demand the exercise of all one's coolness and skill to keep their fiery natures under proper control. Some accident had happened to one of Sir John's old phaeton horses, and Harry, who fancied, as he was not

allowed to use any violent exercise, that driving would be an amusement to him, had taken the opportunity of replacing them by a magnificent pair of young nearly thorough-bred chestnuts; and these were the steeds now entrusted to my guidance. Not being anxious, however, to emulate the fate of the unfortunate Muffington Spoffkins, I held them well in hand for the first three or four miles, and as they became used to their work, gradually allowed them to quicken their pace, till we were bowling along merrily at the rate of ten miles an hour.

A drive of about an hour and a quarter brought me within sight of the little roadside public-house appointed for my rendezvous with Lawless. As I drew sufficiently near to distinguish figures, I perceived the gentleman in question scientifically and picturosqully attired in what might with great propriety be termed *an end* of a shooting jacket, inasmuch as its waist, being prolonged to a strange and unaccountable extent, had, as a necessary consequence, invaded the region of the skirt to a degree which reduced that appendage to the most absurd and infinitesimal proportions. This wonderful garment was composed of a fabric which Freddy Coleman, when he made its acquaintance some few days later, denominated the Mac Ommbus plaid, a gaudy repertoire of colours embracing all the tints of the rainbow, and a few more besides, and was further embellished by a plentiful supply of gent's sporting buttons, which latter articles were not quite so large as choisee plates, and represented in bas-relief a series of moving incidents by flood and field. His nether man exhibited a complicated arrangement of corduroys, leather gaiters, and waterproof boots, which were, of course, wet through; while, to crown the whole, his head was adorned with one of those round felt hats which exactly resemble a boiled apple pudding, and are known by the sobriquet of "wide-awakes," "cos they avn't got no nap about 'em." A stout shooting pony was standing at the door of the ale-house, with a pair of panniers, containing a portmanteau and a gun-case, slung across its back, upon which was seated in triumph the mighty Shrimp, who seemed to possess the singular property of growing older, and nothing else; for, as well as one could judge by appearances, he had not increased an inch in stature since the first day of our acquaintance. His attitude, as I drove up, was one which I must would have delighted in perpetuating. Perched on a kind of pack-saddle, his legs stretched so widely apart, by reason of the stout proportions of the pony, as to be nearly at right angles with his upper man, he held aloft (not a "snowy scarf" but) a pewter pot nearly as large as himself, the contents of which he was transferring to his own throat with an air of relish and *savoir-faire*, which would have done credit to a seven-foot-high coalheaver. The group was completed by a game-keeper, who, seated on a low wooden bench, was dividing some bread and cheese with a magnificent black retriever.

"By Jove! what splendid steppers!" was Lawless's exclamation, as I drove up. "Now, that's what I call perfect action; high enough to look well, without battering the feet to pieces—the leg a little arched, and thrown out boldly—no fear of their putting down their pins in the same place they pick them up from. Ah!" he continued, for the first time observing me, "Fairleigh, how are you, old fellow? Slap up cattle you've got there, and no mistake—belong to Sir John Oaklands, I suppose. Do you happen to know where they got hold of them?"

"Harry wanted a pair of phaeton horses, and the coachman recommended these," replied I; "but I've no idea where he heard of them."

"Rising five and six," continued Lawless, examining their mouths with deep interest; "no do there—the tush well up in one, and nicely through in the other, and the mark in the nippers just as it should be to correspond: own brothers I'll bet 100!—good full eyes,

(1) Continued from p. 279.

small heads well set on, slanting shoulders, legs as clean as a colt's—feet are a *leetle* small, but that's the breed—whereabouts was the figure, did you hear?—five fifties never bought them, unless they were as cheap as dirt, eh?"

"That was about their price, if I remember correctly," replied I. "Harry thought it was too much to give, but Sir John, the moment he saw his son would like to have them, wrote the cheque, and paid for them on the spot."

"Well, I'll give him all the money any day, if he's tired of his bargain," rejoined Lawless, "but we won't keep them standing now they're warm—here, Shrimp, my great coat—get off that pony this instant, you luxurious young vagabond. Never saw such a boy in my life to ride as that is—if there is any thing that can by possibility carry him, not a step will he stir on foot—doesn't believe legs were meant to walk with, it's my opinion—why, this very morning, before they brought out the shooting pony, he got on the retriever, and he has such a seat too, that the dog could not throw him off, till Bassett thought of sending him into the water: he slipped off in double-quick time then, for he has had a regular hydrophobia upon him ever since his adventure in the horse-pond. What, not down yet? I shall take a horse-whip to you, Sir, directly."

Thus admonished, Shrimp, who had taken advantage of his master's pre-occupation to finish the contents of the pewter pot, tossed the utensil to the game-keeper, having previously attracted that individual's attention by exclaiming in a tone of easy familiarity—"Look out, Leggings,"—then, as the man, taken by surprise, and having some difficulty in saving himself from a blow on the nose, allowed the pot to slip through his hands, Shrimp continued, "Catch it, clumsy! well, I never—now mind, if you've gone and bumped it, it's your own doing, and you pays for dilapidations, as we calls 'em at Cambridge. Coming, Sir—d'rec'ly, Sir—yes, Sir!" So saying, he slipped down the pony's shoulder, shook himself to set his dress in order as soon as he reached terra firma, and unbuckling Lawless's driving coat, which was fastened round his waist by a broad strap, jumped upon a horse-block, and held out the garment at arm's length for his master to put on. The gun case and carpet bag were then transferred from the pony to the phaeton, and resigning the reins to Lawless, who I knew would be miserable unless he were allowed to drive, we started, Shrimp being installed in the hind seat, where, folding his arms, he leaned back, favouring us with a glance which seemed to say, "you may proceed, I am quite comfortable."

"It was about time for me to take an affectionate farewell of Alma Mater," observed Lawless, after he had criticised and admired the horses afresh, and at such length that I could not help smiling at the fulfilment of Oakland's prediction,—"it was about time for me to be off, for the duos were becoming rather too particular in their attentions. I was in a regular state of alarm the other day, I can tell you—I was fool enough to pay two or three bills, and that gave the rest of the fellows a notion that I was about to bolt, I suppose; for one morning, I was regularly besieged by them. I taught them a trick or two, though, before I had done with them: they won't forget me in a hurry, I expect."

"Indeed! and how did you contrive to fix yourself so indelibly in their recollections?" asked I.

"Eh! 'though lost to sight to memory dear,'—rather that style of thing, you know. So you want to hear all about it, eh? well, it was a good lark, I must say; I was telling it to Bassett last night, and it nearly killed him. I don't know whether you've seen him lately, but he's grown horridly fat. He has taken to keeping prize bullocks, and I think he has caught it of 'em; rides sixteen stone if he rides a pound. I tell him he'll break his neck some of these days, if he chooses to go on hunting—the horses can't stand it. However, he went into such fits of laughter, when I told him about it, that he

got quite black in the face, and I rang the bell and swore he was in an apoplexy, but the servant seemed used to the sort of thing, and brought him a jug o' beer, which resuscitated him. Well, to return to my mutton, as the Mounseers have it—the very day I intended to leave Cambridge, Shrimp came in while I was breakfasting, with a great coarse-looking letter in his hand.

"Please, Sir, Mr. Pigskin has called with his little account, and would be very glad if you would let him have the money."

"Pleasant, thinks I. 'Here, boy, let's have a look at this precious little account—hum! ha! hunting saddle, gag-bit for Lamplighter, head-piece and reins to ditto, racing saddle for chestnut mare,' &c., &c., &c.; a horrid affair as long as my arm—total, 96*l.* 18*s.* 2*d.*; and the blackguard had charged every thing half as much again as he had told me when I ordered it. Still I thought I'd pay the fellow, and have done with him, if I had got tin enough left; so I told Shrimp to show him into the rooms of a man who lived over me, but was away at the time, and there let him wait. Lo! and behold! when I came to look about the tin, I found that, instead of having ninety pounds at the banker's, I had overdrawn my account some hundred pounds or more; so that paying was quite out of the question, and I was just going to ring the bell, and beg Mr. Pigskin to call again in a day or two, by which time I should have been 'over the hills and far away,' when Shrimp made his appearance.

"Please Sir, there's ever so many more gents called for their money. There's Mr. Flanker, the whip-maker, and Mr. Smokem, from the cigar shop, and Trotter, the boot-maker, and—yes, Sir, there's a young man from Mr. Tinsel, the jeweller; and, oh! a load more of 'em, if you please, Sir!"

"This was agreeable, certainly; what to be at I didn't know, when suddenly a bright idea came across me.

"What have you done with 'em?" asked I.

"Put 'em all into Mr. Skulker's rooms, Sir."

"That's the ticket," said I. "Now, listen to me. Look out, and see if there are any more coming;—if there are, show 'em up to the others; take up a couple of bottles of wine and some glasses, and tell them I must beg them to wait a quarter of an hour or so before I shall be quite ready to settle with them, and as soon as the room is full, come and tell me."

"In about ten minutes Shrimp reported that he could not see any more coming, and that he thought 'all the gents I dealt with, was up-stairs.'

"That's the time of day!" exclaimed I, and taking out the key of the room, which Skulker had left with me, in case I might like to put a friend to sleep there, I slipped off my shoes, and creeping up-stairs as softly as possible, I locked the door. 'Now then, Shrimp,' said I, 'run and fetch me some good stout screws and a screw-driver.' He was not long getting them, and in less than five minutes I had them all screwed in as fast as if they had been in their coffins, for they were kicking up such a row over their wine that they never heard me. Well, as soon as I had bagged my game, I set Shrimp to work; we packed up the traps, and sent them to the coach-office,—found a coach about to start in half an hour, booked myself for the box, and then strolled back to see how the caged birds were getting on. By this time they had come to a sense of their situation, and were hammering away, and swearing, and going on like troopers; but all to no purpose, for the door was a famous strong one, and they had no means of breaking it open. Well, after I had had a good laugh at the row they were making, I tapped at the door, and 'discoorsed' 'em, as Paddy calls it. I told them that I was so much shocked by the want of refinement and proper feeling and all that sort of thing which they had shown, in coming and besieging me as they had done, that I felt it was a duty I owed to society at large, and to themselves in particular, to read them a severe lesson; therefore, on mature deliberation, I

had sentenced them to imprisonment for the term of one hour, and to wait for their money till such time as I should further decree, which I begged to assure them would not be until I might find it perfectly convenient to myself to pay them; and I wound up by telling them to make themselves quite at home, entreating them not to fatigue themselves by trying to get out, for that they had not a chance of succeeding; inquiring whether they had any commands for London, and wishing them a very affectionate farewell for some time to come. And then down I ran, leaving them roaring and bellowing like so many mad bulls,—got to the office just in time, and tipping the coachman, drove three parts of the way to town, feeling as jolly as if I had won a thousand pounds on the Derby."

"And what became of the locked-up tradesmen?" inquired I.

"Oh! why they stayed there above two hours before anybody let them out, amusing themselves by smashing the windows, breaking the furniture to pieces, (one of them was an upholsterer, and had an eye to business, I dare say,) and kicking all the paint off the door—However, I have written to Skulker, to get it all set to rights, and send me the bill, so no harm's done,—it will teach those fellows a lesson they won't forget in a hurry, and the next time they wish to bully a Cantab, they'll recollect my little 'matinée musicale,' as I call it.—Oh! they made a sweet row, I can assure you, Sir."

The chestnuts trotted merrily on their homeward journey, and the noble oaks of Heathfield Park, their leafless branches pointing like giant arms to the cold blue sky above them, soon came in sight.

"You are a great deal too early for dinner, Lawless," said I, as we drove up; "suppose you walk down to our cottage, and let me introduce you to my mother and sister; you'll find Oaklands there, most likely, for he talked of going to play chess."

"Eh! your mother and sister! by Jove I never thought of them; I declare I had forgotten there were any ladies in the case—I can't go near them in this pickle, I'm all over mud and pleasant feathers, they'll take me for a native of the Sandwich Islands, one of the boys that ate Captain Cook,—precious tough work it must have been, too, for he was no chicken; I wonder how they trussed him—No! I'll make myself a little more like a christian, and then I'll come down and be introduced to them if it's necessary, but I shall not be able to say half-a-dozen words to them: it's a fact, I never can talk to a woman, except that girl at old Coleman's hop, Di Clapperton; she went the pace with me, no end. By the way, how's the other young woman, Miss Clara Sav—"

"If you really want to dress before you come to the cottage," interrupted I hastily, "you have no time to lose."

"Hav'n't I! off we go then," cried my companion; "here, you lazy young imp," he continued, seizing Shrimp by the collar of his coat, and dropping him to the ground, as one would a kitten, "find my room, and get out my things directly—brush along."

So saying, he sprang from the phaeton, and rushed into the hall, pushing Shrimp before him, to the utter consternation of the dignified old butler, who, accustomed to the graceful indolence which characterised his young master's every movement, was quite unprepared for such an energetic mode of proceeding.

Forgetting that politeness required me to wait for my companion, I threw the reins to a groom, and started off at a quick pace in the direction of the cottage.

Lawless's concluding words had aroused a train of thought sufficiently interesting to banish every other recollection. Sweet Clara! it was quite a month since I had parted from her, but the soft tones of her silvery voice still lingered on my ear,—the trustful expression of her bright eyes—the appealing sadness of that mournful smile, more touching in its quiet melancholy

than many a deeper sign of woe, still presented themselves to my imagination with a vividness which was almost painful. I had received a note from her about a week before, in which she told me that Cumberland had been absent from the Priory for some days, and as long as this was the case, she was comparatively free from annoyance, but that Mr. Vernon's mind was evidently as much set upon the match as ever; nothing, however, she assured me, should induce her to consent, for much as she had always disliked the scheme, she now felt that death were far preferable to a union with a man she despised; and she ended by saying, that whenever she felt inclined to give way to despair, the remembrance of my affection came across her like a sunbeam, and rendered her happy even in the midst of her distress.—Oh! what would I not have given, to have possessed the dear privilege of consoling her, to have told her that she had nothing to fear, that my love should surround and protect her, and that under the hallowing influence of sympathy our happiness for the future would be increased twofold, while sorrow shared between us would be deprived of half its bitterness. In fact, long before I arrived at the cottage I had worked myself up into a great state of excitement, and had originated more romantic nonsense than is promulgated in a "seminary for young ladies," in the interval between the time when the French teacher has put out the candle, and the fair pupils have talked themselves to sleep, which if report does not belie them, is not until they have forfeited all chance of adding to their attractions by getting a little beauty-sleep before twelve o'clock.

"Ah, Frank! back already! what have you done with Lawless?" exclaimed Oaklands, raising his eyes from the chessboard as I entered our little drawing room.

"He will be here shortly," replied I, "but he positively refused to face the ladies till he had changed his shooting costume, so I left him up at the Hall to do so; but how goes the game? who is winning?"

"As was certain to be the case, I am losing," answered Fanny.

"Well, I won't disturb you," returned I, "and perhaps you will have finished before Lawless makes his appearance; where is my mother, by the bye?"

"She only left the room just as you returned," replied Fanny quickly, "she has been sitting here ever since Mr. Oaklands came."

"I do not wish to know where she has been, but where she is," rejoined I, "I want to tell her that Lawless is coming to be introduced to her;—is she up-stairs?"

"I believe she is," was the reply, "but you will only worry her if you disturb her; mamma particularly dislikes being hunted about, you know; you had better sit still, and she will be down again in a few minutes."

"There is no such thing as free will in this world, I believe," exclaimed I, throwing myself back in an easy chair; "however, as you do not very often play the tyrant, you shall have your own way this time. Harry, the chestnuts did their work to admiration, Lawless was delighted with them, and talked of nothing else half the way home."

"I don't doubt it—your queen's in danger, Fanny," was the answer.

Seeing that my companions appeared entirely engrossed by their game, I occupied myself with a book till I heard the ominous sounds. "Check! excuse me, the knight commands that square; you have but one move—checkmate!" "Who has won! though I need not ask. How dare you beat my sister, master Harry?"

"I had some trouble in doing it, I can tell you," replied Oaklands, then turning to Fanny he continued, "had you but moved differently when I called my king to get out of your way, the game would have been entirely in your own hands, for I was so stupid, that up to that moment I never perceived the attack you were making upon me."

"Really I don't think I had a chance of beating you; Frank must take you in hand next, he is a much better player than I am."

"Indeed I am not going to be handed over to Frank, or any one else, in that summary way, I can assure you; I intend to have another game of chess with you to-morrow, after we come in from our ride.—I forgot to tell you that Harris says the little grey Arab carries a lady beautifully—however, I left orders for one of the boys to exercise her well this afternoon, with a side-saddle and a horse-cloth, to enact the part of a lady. At what hour shall we ride to-morrow? it is generally fine before luncheon at this time of year, I think."

"Oh! you are very kind," replied Fanny, hurriedly, "but I am afraid I cannot ride to-morrow."

"Why not? what are you going to do?" inquired Oaklands.

"I am not going to do anything particularly," returned Fanny, hesitating, "but I don't know whether my habit is in wearable order, and—well I will talk to mamma about it—by the bye, I really must go and see what has become of her all this time," she continued, rising to leave the apartment.

"I thought there was nothing my mother disliked so much as being hunted about," rejoined I; "I wonder you can think of disturbing her."

A playful shake of the head was her only reply, and she quitted the room.

AN ADVENTURE IN THE GULF OF FINLAND.

MIDWINTER in the higher latitudes has not only its beauties but its enjoyments, and certainly, in many particulars, a residence in the north of Europe during that season is infinitely more agreeable than in the more southern parts, where rain, wind, damp and fog constitute so great a portion of the winter months. Cold, however intense, when unaccompanied with wind, is far more bearable than a higher temperature with a searching blast, penetrating to the very bones, and the humid air which hangs heavily around. Within doors in the north the whole house is warmed to an agreeable and even temperature, and the inclemency without is defied, but here we find drafts assailing us from every crevice, ill-constructed fire-places which convey no warmth to the rooms, and sleeping rooms which make bed a penance and rising an ordeal, and to say nothing of the injury of those chilly chambers to the health.

We occasionally, but not often, see in miniature some of the glorious winter days of the north, which exhilarate the spirits, brace the nerves, and fill us with enjoyment. A bright sun tinges the whitened surface of the ground with a thousand prismatic colours, sparkling and glittering like the jewelled gardens of the fabled east; the window panes, as if touched by the wand of enchantment, exhibit in a thousand different devices of the most delicate tracery the graceful foliage and vegetation of the tropics, imprinted by the power whose breath would blight and destroy the beautiful realities in nature, while here it brings new wonders to our view. The heretofore dark and barren-looking trees, naked and harsh in their outlines, glance in the sun with every minute spray and shoot, alivered over with the most exquisite frost-work. Every thing is bright and cheerful: the fresh snow, crisped with the severe frost, lies on the ground, glittering radiantly like silver sand, piled sometimes in tiny waves, like the sea shore when the rippling waters of the ebb tide have left it dry, and sometimes heaped in drift beneath the hedges in wreaths and billows arched as if prone to fall, but arrested in their course. The stillness of the air, the absence of all sound, the noiseless tread of the feet, and

the visible glow of the breath, realizing in itself, as it settled on the hair and clothing, the beautiful phenomenon which envelop the trees and shrubs, create sensations which such a moment alone can produce.

It was on such a morning, with the sun shining brightly as in midsummer, but clear and cold, that I left St. Petersburg with a few friends, with the intention of skaiting down to Cronstadt. The frozen surface of the Neva was passable by carriages, and the ice on the Gulf of Finland was said to extend unbroken for ninety miles; thus we apprehended no danger, and started on our expedition in the highest spirits. The ice on the Neva, and at its mouth, where it expands as it enters the Gulf, is not formed in an uniform surface by the action of the frost, but is rough, and piled up by being composed of the vast masses, which floating from the Ladoga lake become arrested by some turn or angle in the shores, and packing together remain firmly united, leaving at intervals little pools, or open places, which freeze subsequently with a smooth transparent face. Among these obstructions it is necessary to pick the way, and select the most favourable course.

For several miles we careered gaily along, and already the distance, and the grey neutral tint with which extreme frost envelops remote objects had dimmed the glittering steeples of the city behind us, when a catastrophe occurred, which mercifully was not fatal in its effects.

We had passed over so many of these transparent frozen pools that we had no misgivings as to the treachery of their surface, but rather sought them out as affording the clearest field for our progress. One of larger extent than usual lay in my path, and I dashed fearlessly on it, but I felt the ice bend beneath me, and long star-like cracks, splitting with a sharp report, marked my progress. I perceived my danger, and endeavoured to propel myself without striking out or allowing my weight to become stationary for a moment, but my precautions were fruitless. The ice was giving way beneath me, and I immediately threw myself flat on my face, hoping that by distributing my weight over the surface I might yet save myself; such was not, however, my good fortune, for after bearing me up for an instant, it gave way on all sides, and I was floating in the water entangled with the broken fragments. The intense cold cut me through the middle as with a knife, depriving me of breath, but there was not a moment to lose. I saw my companions tie their handkerchiefs together, and endeavour to slide them to me with a stick, but I felt that the attempt was hopeless, and that my safety must be gained by my own exertions. I was collected enough to know that I must face the stream to avoid being sucked under the ice, so I struck out with my feet to swim, and clutched the margin of the ice with my hands, which broke and splintered before me as I bore upon it, cutting and tearing them most severely, a circumstance which I was not aware of till afterwards. At last, after the most violent and exhausting exertions, I succeeded in reaching the thick and solid body of the ice, and with the assistance of my companions gained its surface. The thermometer stood at twelve degrees below zero, and in a moment my wet garments encased me as if in armour. We were far from the shore, and farther from any human dwelling, and thus, as assistance was out of the question, there was nothing left but to hasten homewards with all possible speed. A few gymnastic-like movements of the limbs restored the clothing around the joints to a more supple state, so that I was able to move without difficulty, and the natural warmth of the body returned by the exertion of skaiting. I soon reached my home, thankful indeed for my preservation, and not the less so that I did not even suffer the inconvenience of a cold.

E. P. T.

READINGS IN HISTORY.

THE COURT OF STAR CHAMBER.

It has been observed that the tide of research in the present day flows towards the investigation of mediæval history and customs; and some of the brightest names of our literature have stirred the waters of early English history, laying open many a time-fostered prejudice, and bringing forth from the dark mud of party misrepresentation many a bright gem of neglected fact. It is well occasionally to look back to the times in which the foundations were laid, or the superstructure raised of our present state: to endeavour to understand, not merely how the passions of men worked upon the unceasing stream of events, but how that stream also fashioned forth the men who were to control and direct its force. Thus, also, with our laws. They were framed not only in furtherance of the views of their makers, but in accordance with the spirit of the age; it is not the laws which have made the people, but the people who have made the laws, or at least the necessity for them. We have been struck with this while studying that period of our history in which the government first took the semblance of an hereditary monarchy; for till Henry VII. laid the foundation of the Tudor power, our sovereigns were in truth elective; and even at the death of Edward VI. the ambitious Northumberland was undecided to which of the royal heiresses he should present the crown of England. The pretensions of Henry could not be legal, on account of the illegitimacy of his grandfather, John Beaufort, Duke of Somerset: and though his own instruments claim an hereditary right, the Act of his parliament ordaining "that the inheritance of the crowns of England and France, and all dominions appertaining to them, should remain in Henry VII. and the heirs of his body for ever," merely asserted that right for the future; it did not claim it for the past; seeming rather intended to create a parliamentary gift of the crown, and place Henry as the revolutionary founder of a new dynasty.

The period from Henry VII. to James I. forms, perhaps, the most suggestive portion of our history; the seed was sown, and was then beginning to spring, which afterwards shed so baleful a poison over the land: in the selfish rapacity of Henry we behold the germ of his son's tyranny, whence grew the bright flower of Protestantism in England; and in the venal corruption of his court we see the gathering clouds of that tempest which broke upon the unhappy Charles I. When Henry planted his blood-soiled foot upon the throne of England, the kingdom was prostrated by the ruinous waste of the civil wars; her nobles were destroyed or impoverished; her cities were ruined; her fields devastated; but in the midst of this ruin, and greatly caused by it, there was steadily rising into notice and influence, if not to power, that numerous class, the burghers, whose dominion over events,—and through them, over sovereigns—never again waned. Nor were the people deficient in a constitutional spirit, which showed itself in combinations and associations to resent, more frequently than to repel, injustice; but the nobles, decimated by the field and the scaffold, and impoverished by attainders, were but too glad to purchase safety by the sacrifice of what it would have been difficult to retain. Henry could scarcely be termed his people's choice; he could not have held his crown in safety had he not at length yielded to their demands, and associated Elizabeth of York with himself in the regal dignity. His first policy obviously was, to reduce the power of those nobles whose intimate connexion with the crown by marriage or descent had been one great moving spring of the wars of the "Roses." Enough of feudality still remained to render these nobles equally formidable in peace as in war, by means

of their large number of retainers, wearing the livery or badge of their lord; by the power given by the feudal laws of redressing private grievances, and by the disrepute into which the tribunals of the country had fallen through civil war and party oppression, thereby giving rise to those associations among the people which set law at defiance. In fact, the intimate connexion which still existed between lord and tenant, left the sovereign scarcely more than a choice of evils as to the method of combating so many difficulties.

Hallam says, that the policy of Henry VII. has been overrated. That as changing the line of descent, and as coinciding with the commencement of what is termed modern history, his accession is an *æra*; but that he did not carry the authority of the crown much beyond the point at which Edward IV. had left it. His statute giving the power of alienating entailed lands,—a permission evidently tending to weaken and impoverish the aristocracy,—is, with little variation, a transcript of a statute of Richard III. By it, entailed estates were rendered liable to forfeiture by treason or felony;—an important matter to the crown in times when the frequent revolutions and changes of rulers laid in turn almost every noble of the kingdom under the ban of treason and forfeiture. Under these circumstances, and remembering Henry's disposition, it is not surprising that in his reign we should find an irresponsible tribunal, exercising a hated and dreadful, but unopposed, despotism. Such was the Court of Star Chamber, which meets us at every turn in our civil wars, whether of the Roses, or the Stuarts; standing in its shadowy terror, not only as an alarm to evil doers, but as an instrument by which the innocent man was robbed of his fortune, while the guilty rich one bought indemnity for crime. The term "shadowy terror" does not intimate that the inflictions of the Court of Star Chamber were unreal or nominal; but that, though not recognised by the law of England, this tribunal—by constant usage, and gradually assuming fresh power—had so strengthened its usurped authority as to become an efficient instrument of royal rapacity. To understand the growth of this jurisdiction, we must look back to an earlier period of our history.

The *consilium ordinarium* was a court held before the king in his palace; it was composed of the members of his privy council, with the spiritual and temporal peers; it was a court of jurisdiction, and the members of it were not necessarily members of the privy council; while the latter were the advisers of the Crown, and had a right to sit in the ordinary council. We constantly find traces of the interference of the king and his council in the litigations of the people, and from the latter all our superior courts of justice originated. Press of business, convenience, and other causes led to the establishment of separate tribunals, each having its judicial office; hence arose the courts of King's Bench, Common Pleas, and Exchequer; but the king's council still remained, as a court of appeal from inferior tribunals, exercising the authority of supervision over writs and proceedings in common law; determining matters not thus cognisable, and cases which seemed to demand special interference. According to Lord Bacon the Star Chamber took notice of "middle acts towards crimes, capital or heinous, not actually committed or perpetrated." Sir T. Smith specifies scandalous reports of persons in power, and seditious news, as offences which it was accustomed to punish. This was in violation of many ancient laws, statutes against the jurisdiction of the *consilium ordinarium* having been frequently enacted. Here was truly a broad basis whereon to build arbitrary power; but even so early as Edward II. we find the equitable jurisdiction of the Court of Chancery growing out of the wide surveillance of the king's council; a custom having then sprung up of referring the petitions of suitors aggrieved at common law to the Chancellor. In the reign of Edward III. the people, or rather the Commons, were

beginning to feel their own weight; as an evidence of which, the parliament of Northampton, in 1328, laid the foundation of the resolution of the Long Parliament, and the act of George II. which forbade the presence of the military at an election, by prohibiting in the writ of summons the tumultuous retinues of armed men which usually attended upon these occasions. This declaration of independence was followed by the enactment of the first statute of Northampton, in which provision was made for the better administration of justice both in criminal and civil cases, and restricting the jurisdiction of the king's council to cases not determinable by common law. The influence of the nobles was checked and limited; the rights of the people were declared and guarded, especially with respect to commercial monopolies, which were abolished by this statute. In the same reign the power of the king's council to issue special commissions was petitioned against by the Commons, and gradually relinquished; but the point was combated by Richard II. Henry IV. and Henry V.; and in the reign of Henry VI. regulations were passed for the management of causes before the council, allowing its decision in cases where the complaint was against a man of great influence, or where the suitor was too poor to prosecute in the inferior courts, or in which the council saw "other reasonable cause." This seems most excellent; as in those unsettled times, when might often prevailed over right, even without a struggle, and when the poor man often possessed neither pecuniary means nor legal opportunity of confronting his oppressor, a court to which the people might fly for relief, and obtain it without paying money, was needful, and likely to be of great utility; we shall see presently how it was abused.

In the reigns of Henry VI. and Henry VII. the business before the council increased; the old restrictions upon its power were more and more disregarded; and the latter king passed an Act, giving the council authority over cases which might be determined at common law, a usurpation which afterwards hastened the downfall of the Court of Star Chamber. The council held their sittings in a chamber of the palace at Westminster, known as "the council chamber near the Exchequer," and the "Chambre des Estoilles;" which chamber is said to have been situated in the outermost quadrangle of the palace, next the bank of the river, and was consequently easily accessible to the suitors. The name is supposed to have arisen from the coiling of the apartment being anciently gilded with stars, perhaps in imitation of the old Jewish and oriental practice of dispensing justice under the canopy of Heaven only. However this may have been, in the reign of Henry VII. we find the phrase "The Council in the Star Chamber" merged in the designation "Court of Star Chamber." The course of its jurisdiction was either by personal summons, or by bill; the former often arose from secret information given to the council; or "by the curious eye of the State and King's council prying into the inconveniences and mischiefs which abound in the commonwealth." The accused, or suspected person was apprehended, dragged from home in ignorance of the charge against him, and, without friend or counsel, subjected to a rigorous examination "before the members of a tribunal which was bound by no law, and which itself created and defined the offences it punished." There was no previously declared accusation against which the defendant might prepare himself; he was confronted with no accuser, but "in the presence of a secret assembly, comprehending some of the most dignified persons of the realm,—an assembly calculated to overawe the boldest offender, and utterly confound a person of any timidity, he was interrogated upon points of his conduct, respecting which the council had received information through the trustworthy channels of common rumour, or secret intelligence." If the accused would not confess, he was detained in custody while the council proceeded against him by bill; and

if, dreading such confinement, he submitted to examination, he was liable to hear his ignorant and careless words misconstrued, or tortured to suit the preconceived ideas of his judges. This was indeed an "exuberancy of prerogative," as Hudson terms it. A striking feature of the time was that the process of the Star Chamber might be served any where, and the church was frequently the place chosen for this purpose. The nature and manner of the interrogatories put to the accused person by this inquisitorial tribunal may be imagined, when we read, that Lord Chancellor Ellesmere forbade any interrogation respecting any crime not charged; —; as whether a man be honest? or of a knight, "whether he had not hedged and ditched in his time? to disgrace him;" but the examination was still secret, and no assistance or advice allowed to the defendant, he being obliged to answer each question separately without knowing its nature before hand. The examination of witnesses for the prosecution was likewise taken privately; they were not allowed to be questioned by the defendant as being "for the king," and it was alleged that, were they allowed to be so examined, they would be fearful of coming forward in such cases; this with the fact of such witnesses being richly rewarded, shows very clearly the system upon which the court proceeded.

The court sat for the hearing of causes twice, and sometimes thrice, a week; and after the sitting, the lords dined at the public expense: the number of those judges in the reign of Henry VII., and Henry VIII., was nearly forty; in the time of Elizabeth, about thirty; but afterwards, the Peers who were not Privy Counsellors desisted from attendance, thus lessening the number still more. The Chancellor proceeded to the sittings of the court in great state, with his mace and seal carried before him; he was the supreme judge, and alone sat with his head covered. Every punishment except death was claimed by the court, which generally imposed a heavier punishment than was authorized by the statute which the accused person had violated;—fines, whippings, were added to the punishments ordained by the common law; and often the inflictions were as absurd and degrading as they were tyrannical.

During the reign of Henry VII. the Court of Star Chamber comes prominently into notice, that monarch himself preading at no less than twelve sessions in the court within the first two years of his reign. Henry was clear-sighted in perceiving the low state of consideration and respect into which the ordinary courts of justice had fallen; while the combinations of the nobles increasing their power at the expense of the crown, could not be tolerated by a king of so despotic and jealous a temperament. The first act of his reign was calculated and intended to lessen the power of the barons. He administered an oath to his first parliament, that they should not receive or aid any felon, give any livery or token contrary to law, nor assent to any unlawful assembly. At a time when laws were so vaguely defined as at this period, such an oath as the above, even if conscientiously kept, could scarcely answer the purpose intended. But rapacity was a still stronger feature than the love of power in the character of Henry; and the Court of Star Chamber was made the instrument by which he accomplished his nefarious purposes. Was a man a partizan of the White Rose? — was he suspected of favouring the unfortunate Earl of Warwick? — was his spirit thought too independent? — or was he reputed rich? Some long forgotten statute, "like a sword long rusty," was put in force against him, and his purse paid for his pardon. After the death of Elizabeth, the only link which bound Henry to the house of York, innumerable penal statutes were put into execution by Empson and Dudley; and these "ravaging wolves had such a guard of false perjured persons belonging to them, that the king was sure to win, whoever lost. And at this unreasonable and extort doing, noble men grudged, mean men kicked, poor men lamented, preachers openly at Paul's

cross and other places exclaimed, rebuked and detested, but yet they would never amend." The king might legally require excessive fines from his wards, on granting them liveries when they attained their majority; but, besides this source of revenue, which explains one reason why our early monarchs so eagerly claimed guardianship of the children of the nobility, Henry fined the Earl of Oxford 15,000*l.* for keeping his retainers in livery; an illegal custom certainly, but too general to be punished hitherto. Every place at court, and under the government, was also made the subject of regal barter, and even bishopricks were sold by this usurper, for such he undoubtedly was.

In the *Lausdowne MSS.*, and quoted by Mr. Bruce in the *Archæologia*, is an account of sums which were received as fines from persons who had compounded with the king; many of these receipts being by Dudley. Among the persons named are many of the first nobility of the land, with other persons of note and official position. Sir William Capel, alderman of London, and Giles his son, were repeatedly "in trouble;" their fines amount to upwards of 3,000*l.* At length Sir W. Capel refused all composition, and "after prysonnement in the Countour and sheriff's house, was by the king's counsell commanded to the Tower, where he remained until the king died, and shortly after was delivered with many others." Among these others whom Henry's death released from unjust and lingering imprisonment was Sir Laurence Aylmer, mayor of London in 1508, he also having refused to compound with the king's rapacious myrmidons. Citizens of London, mayors, sheriffs, all were prosecuted in like manner. Not only did this respectable monarch take every occasion and pretext of exacting fines from his faithful subjects in office, but he took double advantage of them by first selling their appointments to them, and then severely scrutinising their conduct with a view to extorting as heavy sums as they could possibly bear in the shape of fines. From the following items it appears that besides this fertile source of profit to the king's treasury, he assumed the power of withdrawing causes from the jurisdiction of other courts, upon the accused person making a pecuniary arrangement with his tools; in Star-chamber phrase this was expressed by "the king took the matter into his own hands."

The following are some of the items before mentioned, forming a curious commentary upon the provision of *Magna Charta*, that "right and justice are not to be sold."

"For the discharge of an indictment of murder, found in Lincolnshire, against Jo. Cutlare, clerk, 300 marks.

"For Sir David Owen, for a pardon for hunting, 300 marks.

"For the discharge of the Earl of Devon for exchequers, 1000 marks.

"Of Jo. Montgomery, knt., to have the king's favour in traversing an indictment of murder in Staffordshire, 40*l.*

"For Rode of Pawles, for his discharge of, and for a letter by him sent to Rome against the Archbishop of Canterbury, 50 marks.

"For the Earl of Derby for his pardon 6,000*l.*

"For the pardon of the Earl of Northumberland 10,000*l.*

"For the king's most gracious favour to Swan and other certain persons of Kent, to be discharged of all attain sued against them by the Earl of Essex, and Sir Will. Say, 800*l.*

"For the general pardon of the Bishop of Sarum 1,000*l.*"

What a testimony to the state of religion, morality, and law in that age! A pardon for murder bought on the same terms as one for killing the king's deer! Thus, as it has been well said, "Henry converted offences into a source of revenue, and was not anxious to carry into effect the spirit of the law, but to make money out

of the breach of the mere letter of the statutes." We see how much more highly he rated a pardon for offences against himself, than for those against the law of God.

(To be continued.)

A JOURNEY TO DAMASCUS.*

We confess it was with feelings of no little hesitation we took up these volumes; not that we feared the noble author's capability for the task, but simply because the countries of which they treat have been so continually brought before the public by the various writers on the subject, that we really felt little new could be detailed. Most agreeably disappointed have we been. Lord Castlereagh has described the scenes in the various countries through which he traversed, with a freshness and vigour that speedily removed any fears we might have had on the subject. We cannot do better than recommend our readers to peruse the volumes themselves, and are satisfied they will find it a most amusing and entertaining task.

Not the least amusing description in the book, is the mode in which business is transacted by the Turkish tradesmen of Cairo, who waste more time in one *day* for the sake of "smoke," than our merchants do in the space of a *week*. Our author went with Sir G. Wilkinson to order some clothes "from a venerable Turk named Hafiz, whom we found smoking at the bazaar in placid repose, and every now and then carressing his beard, or speaking to a passing acquaintance. We were invited to sit down, and he handed his pipe to Ismael Effendi, by which name Sir Gardiner Wilkinson is known here. My business was explained to him, after which he rose, put his feet into his papooshes, tucked up his long caftan, and departed; but he soon returned, bringing with him another Turk. At least a quarter of an hour was spent by them in animated discussion. The second Turk then left us, and, after a long time, returned with a small piece of cloth. New discussion arose, and fresh pipes were called for, with coffee and sherbet. Then there was some silk to buy. Hafiz got into his papooshes again. Another quarter of an hour elapsed, and then a new consultation began. Then came the measuring, and a great row arose upon a declaration from Turk No. 2, that he wished to see a part of my dress as a pattern. We tried to get him to terms without this, but in vain. After two weary hours, we had only succeeded in buying the silk and cloth, and left Hafiz, promising to revisit him another time. This is an exact and faithful picture of the dealings and business of this country. The merchant goes through the form of pipes, coffee, and rignarole with you, but then you must wait, while he proceeds to another stall, where he gets a pipe and more rignarole; and if he returns again to you, the same farce is repeated, so that the whole affair of cloth, silk, buttons, lining, lace, measuring, fixing, time, and fashion, may occupy half a day, and yet the work may be unfinished. Dawdling through life is their passion; and as great a discussion is made about a para or two, more or less, in their price, as we should make about ten pounds. If you want a sword, you must first buy the blade; the handle is sold by one man, and ornamented by another, a third polishes and cleans it, a fourth makes the scabbard, a fifth the belt or cord, and so on; thus the business becomes endless. The dealers have no idea of time, and had rather not dispose of their wares at all than sell them without the whole ceremony of talk, smoke, and coffee."

And with a short, amusing, but not very flattering

* *A Journey to Damascus, through Egypt, Nubia, Arabia, Petra, and Syria, by Viscount Castlereagh.*—London: Colburn.

description of an inn at Cairo, we must, for the present, be content:—

"Such a scene I never saw as the inn-yard. Imagine a small court containing a half-starved ostrich, looking like a spectre, a monkey, a lynx, donkeys innumerable, camels, dromedaries, Arabs, couriers, dragomen, waiting to be hired; and, in the midst of all, various specimens of the John Bull tribe, starting for India by way of Suez, in Mackintoshes, straw hats, pea-jackets, and every variety of costume. I must not forget a bevy of ladies in green veils and poke bonnets, waiting to be shut into boxes like diminutive sedans, to be jolted across the Suez desert, or looking in utter despair at the broken-down donkeys on which they were to trust themselves, if they preferred a quadruped to a packing-case. In spite of all the noise, crowd, and scramble, we found capital rooms and good accommodations for this country, where, in general, you have four walls, a stone floor, and a divan as your stock of furniture."

MORAL REFLECTIONS; OR, ESSAYS ON MEN, MANNERS, &c.

BY MADAME GUIZOT.

On Man and Human Life.

ON SYMPATHY BETWEEN MAN AND MAN.

VANVENARGUES has said:—"Our enjoyments are derived from mankind; all else is nought." It is, in fact, human nature that attracts and interests us, even in those pleasures which seem to arise from things. A work of art strikes our attention; we seek in it the genius of the artist, we seek the artist himself. A book pleases us: who would not regret, being ignorant of the author? Who would not be glad to see his portrait, still more so to see himself, to enjoy his conversation, to become acquainted with his character and his mind? There is among us all as it were a family secret, a sort of mark by which we acknowledge one another, and which we wish to perceive, in order to be assured of the relationship. Until then, we hold ourselves in reserve; we watch one another with anxious curiosity. A celebrated man enters a circle in which he is only known by name: see how every one examines him, how they study his features, his movements; it seems as though he would do well to prove that he is not an animal of a peculiar kind. As soon as he opens his mouth people are tempted to exclaim with astonishment—"He speaks!" His words and actions are collected and related to prove that he is made like others, that he is a man. If he be surprised in any of those simple occupations common to every one, in which the least skilful will take quite as much pleasure as he, the enchantment is at its height; people almost thank him, at least they love him for it. This is because they have discovered that he belongs to the family. This tie of relationship delights us in the commonest as well as in the most distinguished beings. Let a man be inferior in station, in education, in appearance, if we perceive in him a sentiment which assimilates him to us, we are as much delighted as we should be at getting a glimpse of that in a superior man, which places him within our reach. What pleasure, in reading the works of distant ages, to meet with I know not what affinity of sentiments or opinions which makes us recognise a relation in Cicero, or some other, much more ancient than he! Indian, Chinese, Laplander, Hottentot, however obscure your name may be to us, however foreign to us may be your destiny, let but a movement, a gesture, a sign from you, make us feel

some affinity of this kind, and a sudden and lively joy will seize us; and if, by some glimpse of mind or understanding, the savage of New South Wales or Kamschatka proves to us that he belongs in any degree to the class, we shall be delighted to be able to acknowledge him.

Mankind is so truly that which pleases us, that we desire to see him everywhere; we everywhere require to have united, sympathetic beings, who reveal to us our own nature, and interest us in ourselves. What matters it to us that the tree lives the life of a tree, that it fulfils its vegetable destiny? Man has had need to take a more intimate share in that destiny; he has attached to it a being capable of feeling its changes, as he would himself have felt them; and because he has experienced some grief at seeing the young stem fall, and the young shoots fade, it has appeared to him that there should be in the stem a sorrow similar to his own, and which could alone justify it in his sight. If he has made the stones come out of their immovable and senseless state, it is to lend them the language, the feelings, and the reason of man. If that reason prohibits his seeking for human mind and understanding in the animal he cherishes, still it is by attributing to it affections and almost ideas similar to his own, that he becomes attached to it, makes it a companion, and at length persuades himself that he has made it a friend.

Yet more; never did the imagination of man create fanciful beings, never has it lent to real, but insensible or irrational beings, either feeling or reason, unless it were to make them a part in his own destiny. Man never separates himself from these creations of his mind, he has never found them indifferent to his fate, and forsaking him in the moment that he had given them being: he has animated them either for or against himself. Enemies, or protectors, they have been to him a means of extending his existence, of multiplying in time and space the opportunities in which he could have something to love or to fear, some hope to cherish, some interest to guard; in short, some portion of life to display beyond himself; so true is it, that man dwells not entirely in the visible individual, but that he feels himself existing wherever he can carry and unite his mind and his thought. Wherever you are, whatever may be your ambition and your career, do not give yourself entirely up to society; contrive to cultivate in yourself a taste for solitude, and the scenes of nature; there is in it a language which we must never fail to comprehend, supplies for which we should hold ourselves in reserve. Some day perhaps a clear sky, a beautiful sun, alone will bring peace to the troubled mind, or restore it to that firmness which leads to peace. It is in the country that the return of spring will restore a mind, dejected and weakened from long protracted sufferings, or a heart withered by bitter regrets. It is there that the diversified activity of nature destroys the monotony of a retired life, that the hopes of every year amuse the imagination, and sometimes deceive the heart, under the disappointments of life. He who can be instructed in his flowers, his fruits, or his crops, will never be without a wish and a hope; the old man, even to his latest day, will smile at the thought of a pleasure which may yet bloom again for him; and amid those passing, but soon returning enjoyments, amid those flowers which are incessantly falling and renewing, the dreadful idea of the instability of happiness and life fading never to revive, will disappear.

There are degrees of misfortune which we cannot get out of, but by an extraordinary degree of virtue. A common distress will only admit of common efforts. To astonish others by our firmness and resolution, we must at the same time astonish them by our misfortunes.

The property of genius is to make up for experience.

The finest privilege that glory gives, is to be able to acknowledge its weaknesses.

There are a thousand ways of nobly receiving a favour; I do not know of one in which it could be expected with dignity.

In order to be happy in this world, people should never expect all that they think they merit.

ON WOMAN.

Of all tyrants, custom is that which to sustain itself stands most in need of the opinion which is entertained of its power; its only strength lies in that which is attributed to it. A single attempt to break the yoke soon shows us its fragility. But the chief property of custom is to contract our ideas, like our movements, within the circle it has traced for us; it governs us by the terror it inspires for any new and untried condition. It shows us the walls of the prison within which we are inclosed, as the boundary of the world; beyond that, all is undefined, confusion, chaos; it almost seems as though we should not have air to breathe. Women especially, liable to that fear which springs from ignorance, rather than from knowledge of what one has to fear, easily allow themselves to be governed by custom; but when once broken, they also as easily forget it. A man has less trouble in making up his mind to a change of condition; a woman has less in supporting it; she accustoms herself to it for the same reason that she has hitherto done so, and will still continue to do so.

In the total overthrow which has produced so many changes of fortune among us, we have seen men extricate themselves by their courage and industry; and some, by unremitting exertion, have been able to return to nearly their former position; but nearly all the women, almost without exception, accommodated themselves to their new situation, and they have been quite astonished to learn so quickly and so easily, that what one woman has done, another is able to do also.

ON CHARACTER.—THE COMPLAINER.

The man who is fond of complaining, likes to remain amidst the objects of his vexation; it is at the moment that he declares them insupportable, that he will most strongly revolt against every means which could be proposed for his deliverance. Indecision is in his character, and the misfortune of having to decide would be to him the greatest of all; for a choice always supposes a preference for some advantage, or an inconvenience to be shunned; and this man would not wish it to be supposed, or to suppose himself, that there is a single circumstance in his life in which he is able to follow his inclinations, or meet with an advantage: that there is even one in which he is not obliged to have the greatest possible inconvenience. He therefore increases misfortune, he wishes for mishaps; the fatal influence of his destiny is his favourite topic. A power against which no act can set him free, which compels him to suffer, without being able to protect himself, and permits him to complain without the fear of obtaining justice, —this is what suits him: he asks nothing better than to sigh over his position, and to remain in it.

Fickleness of conduct ought to be the consequence of impetuosity alone: but in frivolous characters, it is the inclination that becomes exhausted, and which, incapable of any long effort, lazily lets fall that which it had at first seized with avidity. In the zeal of steady characters, it is the object alone which eludes the vigour of their grasp; it is the soap bubble that vanishes, not their ardour in the pursuit of it. Show them an object capable of supporting the opinion they have attached to it, and then they are fixed.

MORAL SENTIMENTS.

The truly good, noble, and virtuous mind, acquires with age a sort of agreement between his inclinations, and his principles, which seems to bring it to its true point of maturity and perfection. Be it generous, it was taught from its youth, that forgetfulness of self, which is the spring of every virtue; but passions arose,

and gave it in some sort a new being, to which it was compelled to unite.

Freed from passions, it felt the power of circumstances; a situation of difficulty; an existence on which the existence of others depended, oblige the most disinterested man to make his own concerns his first consideration; to protect incessantly that which his character would most incline him to part with. At length, the old man becomes more independent; those whom he used to support, are now able to provide for themselves; delivered from the weight of management, he sees his expenses are too contracted, and he disposes of his income more freely. All his sacrifices will be personal; he can enjoy them without constraint, and without scruple, and there remains abundance for him to do. "In youth," says Madame de Lambert, "people think of you; in old age, you must think of others." This, which is an active duty with women, who are usually burthened with the details of life for those who are around them, is generally passive with men, and is considered a merit in those who perform them. But to women, the active exercise of kindness can give a charm and an interest to the latest portion of their life. For men, to whom these little details are unsuited, to whom great emotions are not more suited, kindness can hardly ever be any thing but indulgence, privation, renouncement. Those regards, those cares, those deferences due to his age, he will not know how to exact, and are yielded with much more pleasure for not being demanded as a tribute; he can smile at a forgotten duty which had only himself for its object, he can enjoy the jokes of others made upon himself, as well as those upon his acquaintances.

But this indulgence, this forbearance of the old man, does it proceed from his age? certainly not; it is in spring that the buds shoot forth of that fruit which we see ripen in autumn for the winter provision. The virtues of the old man would not have been so affecting, so venerable, had they not been the result of the efforts of his whole life. In the veneration which he inspires, he appears to place before our view a picture of the different ages he has travelled through with honour: every thing about him wears an imposing aspect, even to that long life, even to that remainder of health and strength, of which the old man is so justly entitled to feel proud.

THE WORLD.—ON CONVERSATION.

Observe two children of the same age meeting and entering into conversation: they will talk of their dolls, if they are little girls; of their balls and their tricks, if they are little boys; they understand one another admirably, and do not grow weary of being together. Observe the lower class of women: one speaks, another answers, their chatter does not flag for an instant: they talk and listen by turns with so much interest, with so much ardour; if there be a moment's pause, it is filled up with exclamations which prove the deep interest that is felt in the subject they are discussing; every one present appears to be equally pleased. Is it that those persons have ever learned the art of conversation?

Enter into a circle of the higher class, who have probably been told how to make themselves agreeable in conversation: one yawns inwardly, because he is well educated; another holds a newspaper in his hand, which he has read; some one speaks, another, to make it appear that he had been listening, answers by a yes, or a smile, which excuses him from having heard, and they again fall back into silence. But what is there surprising in this? Of those persons thus brought together, one passes his time at his estate, which he must improve, and can only talk about hay, the price of corn, and the roguery of the timber merchants; this one knows nothing except of the theatre, the fashions, or a new novel; that one lives in his study with Homer, commentators, or ages; this one is a politician; that one a lawyer. What point of contact can they have?

what would be the bond of common conversation among them?

The lower class of people, like children, are contracted within nearly the same circle of interests, limited within the same degree of understanding, equally affected by the same things, and, their thoughts bent upon the same objects, understand and answer one another without requiring any other bond than that of the interest they all equally feel in the subject of their discourse. They can always talk to each other, because they have but few subjects of conversation. The higher class, between whom many subjects can be discussed, are silent, whenever one is chosen which may not be interesting to another. People talk in the chamber of a man in power, surrounded by his dependents, because every one is agreed upon the subject of conversation which is suited to a man in power; people talk around a pretty woman, whom they are anxious to please, because she gives the lead to what is agreeable to herself; people talk whenever their common interests or feelings engage the one to speak, and the other to listen, upon the same subject. It is not sufficient for them to have similar ideas, for he who has ideas only wants to communicate them; but a feeling wishes to be responded to, and requires to answer. Be it self-love, it wants approval, just as complaisance wishes to approve, and approbation stimulates to merit it again. The wish to please desires to be encouraged, is redoubled by encouragement, and communicates itself to him or to her who inspires it; it is the electric spark; it runs through the circle, loosens every tongue, and excites conversation. The wish to oblige, to make every one happy, supports it still more freely. Look at the mistress of a house, who wishes to make every one comfortable about her, and feel at their ease, how well she can make people talk! If she be young, it will be about herself; if she be old, it will be about others. The young might, in her anxiety, show some preferences, because she also wishes to be pleased; she will keep up a conversation with much more sprightliness with him who pleases her. The old woman will wish people to love her, she will endeavour to give to each person a share in the conversation, and to make them feel satisfied; she will choose the subject in which each can take the greatest pleasure, and which will unite the greatest number of people in a common feeling. She will not forget herself, and she will be right; for to make conversation agreeable, we must be interested in it,—we must enjoy it ourselves, and not merely talk to amuse others, who will feel little satisfied with the pleasure you afford them, if they perceive that they afford none to you.

What, then, is required to bring us within the reach of this knowledge, this art of conversation? Nothing but the precept of God's commandments, "to love our neighbour as ourselves." Seek your neighbour's pleasure equally with your own, be pleased with what he does for you, as well as what you do for him; this is the secret of what forms the pleasure and the happiness of every relation of life.

(To be continued.)

THE HOUSE WHERE SHAKSPEARE WAS BORN.

IF, in the annals of any clime or age, there ever existed a man to whose memory and greatness the greatest amount of veneration should be displayed by his countrymen, surely that man is Shakspeare. Every trace of the whereabouts or haunt of such a man should be preserved and retained in its pristine integrity. There is no land in the universe that has ever produced his equal. Not for an age, but for all time he wrote; aye, living in advance of his age, he will live for ever after it. Where are the homelies that contain more exqui-

sitely truthful and more solemn moral sentiments than are to be found scattered with no niggardly hand through his varied pages? Where is there wit more refined; humour more poignant, and more devoid of venomous sting? What more masterly delineator of character, and searcher into the old human heart, than honest Will Shakspeare! The sweet subtlety of his finer fancies—how beautiful they are, how spontaneous the descriptions of natural scenery and natural life! It is less the poet than the man and christian who speaks so wisely and so well. Hear him in the woods and fields, by river brink, and meadow gay, how eloquently he discourses on the theme of Nature; showing, in his profound knowledge of flowers and all fair things beside, how true and vivid were his perceptions of her secret workings. Not a word passing from his cunning brain but is redolent of some poetic adaptation of the realities of life to the ideal realms of beauty and the beautiful. In the creations of his fancy we witness the very masterpieces of man's imagining,—the delicate Ariel, the loving fairies, the weird sisters three, the melancholy ghost; how grand their conception, how perfect the elaboration of their ends and aims! So, too, in the majesty and depth of his tragedies,—what part of all that man could dare to say, or think, or do, is left unsaid, or coldly shown to the imagination of the reader? How we tremble, and are a-cold with the wandering and crazed Lear! how our sympathies are kindled and enlisted on the side of the gentle Desdemona, and Verona's sad lovers! How we moralise with poor Hamlet; and follow Macbeth, as, step by step, he progresses in crime! And, to turn to fairer and brighter scenes,—in the forest of Ardennes, how we love to linger with Rosalind and the satirist Jacques, inhaling new tastes for a sylvan life, where it is so merry in the greenwood! In the comedies, how we revel in the hilarity of Falstaff; how joyously the laugh of Beatrice rings in our ears; how delightedly we see the discomfiture of the vain Malvolio, and witness the taming of the shrewish Katharine! And these things never tire,—read them often as we may, there is ever some new charm to be discovered, some new beauty to be found. In a company composed almost entirely of foreigners, the writer of this article once heard a German gentleman say, that he considered an Englishman to possess one privilege greater than that bestowed on any native of his own, or any other country; and that one was to be the countryman of William Shakspeare. This noble and spirit-stirring sentiment was echoed by every one present; and it may be conceived how pleasingly on an English ear so elegant a tribute to our gifted poet fell. Although it may, indeed, be said, that he belongs to no one country, so universal is his genius, so elevating the tendency of his works; yet it is a privilege and an honour to claim him as our own. No man has probably ever done more to elevate the mind, and lift it above the levelling and harassing cares of life. If he is not to be honoured, whom shall we honour? Are we for ever and a day to be looked upon as a commercial race only,—a nation of shopkeepers, unable alike to appreciate genius when it lives amongst us, speaking our language, and uttering our thoughts, to a music more beautiful than our mere household words can lend us, and unwilling to venerate it when the voice that addressed us is heard no more; when its silver sounds are staid, and it passes into the darksome grave, and is listened to no more amongst men? Shall we for ever and aye be a reproach and a scoff for our neighbours' tongues to wag at? Go to, it is all too monstrous; we are living in a century of intellect, when he who runs may read, when the race is not always to the swift, or the battle to the strong, when high Art is making his rapid and gigantic strides around and about us, and all things tell of progress and improvement throughout the length and breadth of the land. We have a feeling above buttons. Ye may laugh at us, denizens of sunny France, and fairer Italy, but have your jest, an ye may;

we are an improving people, and are giving our idle money to our Tennysons, our Leigh Hunts, our Sheridan Knowleses, and others, who are yet breathing and thinking creatures in this vast community. Shall we be derided, forsooth, because of the faults and follies of our predecessors? Is the flower that blossoms so freely and so sweetly to-day, to smell only of the earth from whence it sprang? Shall it not, in rising upwards, catch something of the spiritual fragrance of heaven? Are the airs that surround it so heavy with blight and all noxious vapours, that it can waft no gentle sweetness of its own to purify and fill the world it lives in?

Oh! it may be well to call us a mercantile people, plodders and workers in base metal; but we have our intellectualities about us, and can boast of our vigorous and inflexible Carlyles, our classic and far-seeing Macaulays; and rejoicing in the chaste outpourings of a sweet army of literary penwomen, who, in prose and in verse, are constantly on the alert to gladden us with their lofty aspirings, can truly testify that the empire of mind is extending its sway in all directions o'er our path. Yet stay, countrymen, I beseech you to have patience, and give an attentive ear to the public crier.

Rumour—that same Rumour whom our own loved Shakspeare has employed to so good a purpose—hath spoken in no mysterious manner within these few weeks past, and hath proclaimed to all whom it may concern, that the HOUSE and HOME of SHAKSPEARE (the very walls where first he saw the light) is in the market, and will be sold, *mal gré bon gré*, ere the summer leaves have passed to their place of nothingness and dust. And Rumour adds, that our Government will not make it public property; still further reporting, that some speculative Americans are on the watch to make it their own, and by some contrivance carry it out of the country, and plant in their own home this trophy of their enterprise and England's everlasting shame. Now this concerns us much, and well shall we deserve the opprobrium of all nations if an indignity like this is to be suffered. Readers of Shakspeare, think of it; fathers, who have, as English fathers ought, turned down page after page of the plays of our history, for your sons to read and strive to learn the spirit of the heroes that therein fought and fell; mothers, who have beside your knitting and your calm domestic occupations read to your heedless lazzos of the faith and virtue of Imogen, of the justice and judgment of Portia, and spoken of the friendship even unto death of Beatrice, the merry hearted but womanly Beatrice; men, poets, philosophers, ye whose life has been ever moving with the sun, or ye whose progress onward has been marked with the briars and thorns of life's sad sorrows and reverses, one and all I call on you to prevent this tasteless desecration. To Shakspeare you all must owe much—more than you can ever in a lifetime pay in other coin than by homage to his genius and his excellence. Prevent it by all possible means, strive by some method

“to intermit the plague
That needs must light on this ingratitude.”

Do not allow such a transaction to become the by-word of the many enlightened foreign tourists who annually visit this island. Be assured, my countrymen, the eyes of Europe will be upon you. In such a case, why seek for evidence to support and sustain it?

“Ma che cerco, argomentì? Il cielo giuro,
Il ciel che n'ode, e ch'ingannar non fice;
Ch'allorchè si rischiara il mondo oscurò
Spirito errante il vidi ed infelice,
Che spettacolo, oimè, crudele e duro!”

It is useless, it would be unavailing, here to sum up the extraordinary merits of this great man. His works, are they not met with from one end of the world to the other? are they not the companion of every student who seeks to master the knowledge of mankind, and the various impulses and motives that regulate the

movements of men in all states and conditions of society, from the peasant to the peer? And the birth place of this man, this high priest of Nature, is to be converted into a travelling show! Imagine an Englishman being requested to walk up, as he would to Richardson's caravan, or some itinerant Mrs. Jarley's wax-work, where, for the low price of twopence, he may see the room where Shakspeare was born! Let the mind of an Englishman carry him to this exhibition, and suppose, as a fitting pendant to this profanation, he should hear the showman, wearied and exhausted with the labours of his calling, reply to the question of an urchin, anxious for information and intelligence as to the precise apartment, in some such country-fair fashion as the often quoted and familiar phrase, “Whichover you please, my little dear.” It is too much; so gross an outrage on all good taste, on all proper feeling, will surely never be submitted to. Yet what more likely to happen, if the humble dwelling be transported across the wide Atlantic, and carried on wheels from New York to Boston, and so as occasion serves through all the United States, the latest novelty from England, and the immediate successor in attractiveness to the little general light Tom Thumb? And this insult is to be offered to the fame and name of William Shakspeare, the man that all the world hath delighted to honour, the man of whom a German critic has said, “Hat doch auch Shakspeare's Ruhm den Weg zu allen Brülleihen gefunden, wohin nur Britanniens Dreizack godrunge ist.” If the sum required to purchase that which ought to be exclusively the property of the British nation, be so large as to become a serious matter to one individual, why may not a committee of gentlemen associate and act together, so that by subscriptions we shall retain in its only proper place a habitation so remarkable, so every way worthy men's honour and respect.

It is to be regretted that when Shakspeare wrote his memorable epitaph, in which he threatens the disturber of his mortal remains with his potent malediction, he did not extend the curse upon those who should do similar violence to the roof that sheltered his earliest years. Within a very short period Schiller's house was disposed of; in that instance, the town council met as one man, and buying what they justly considered as the town's own, presented it as the freehold for ever and aye of the town. Shall Englishmen be laggards, and refuse to follow so noble an example?—shall we not rather strive to effect so desirable a consummation, and be happy in our well doing? Yes! let us prove ourselves as sincere in our estimation of the most wonderful of minds, as was his friend, rare Ben Jonson, who, mourning his untimely death, spake of him thus:—

“But stay, I see thee in the hemisphere
Advanced, and made a constellation there!
Shine forth, thou star of poets, and with rage
Or influence, chide or cheer the drooping stage,
Which, since thy flight from hence, hath mourn'd like night,
And despaired day, but for thy volume's light.”

Yes! I think of the spoliation of a poet's home, ye who have travelled so often through the manifold scenes he has depicted; think of Stratford-upon-Avon deprived of the house where Shakspeare was born.—think of it, and prevent it. Let not Brother Jonathan exult in the possession of a relic so inestimable, so priceless. Let genius have its dues. Let the mighty English Magician be your watchword, to hinder the contemplated sacrilege, and so let us keep every remnant that belongs to his history, as a treasure the most costly of our world of Art. The biography of him is but a meagre and unsatisfactory affair. Let us not then part with the little we do possess, that helps to enlighten us of his actual life and manner of living.

Countrymen of Shakspeare! attend to this matter, and leave to your children, and your children's children, a glorious legacy—the power of appreciating the worth of the mightiest intellect that ever swayed the hearts and minds of men.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE LAY OF THE SWORD.

[Translation of a poem by Theodor Körner, composed a few hours before the battle in which he fell.]

PHILOGERMANUS.

SWORD, on my left side beaming,
What means thy blitheasome gleaming?
So kindly shows thy light,
Thou gladst my joyous sight.
Hurrah!

"A gallant warrior bears me:
'Tis this that joys and cheers me;
A freeman's brand am I,
So beam I gladsomely."
Hurrah!

Yes! freeman am I truly,
And love thee dearly, duly,
As thou wert mine allied,
My lov'd and loving bride.
Hurrah!

"And I to thee, full tender,
Mine iron life surrender.
Ah! would we were allied!
When fetchest thou thy bride?"
Hurrah!

The trumpet's festal warning
Proclaims our bridal morning:
When brays the artillery's din,
Bring I my true love in.
Hurrah!

"Blest hour, when shall we marry?
In longing love I tarry.
O bridegroom, summon me!
My bridewreath waits for thee."
Hurrah!

Why in thy sheath thus sounding,
My iron love? why bounding
So wild against the foe?
My sword, why bound'st thou so?
Hurrah!

"Good cause have I to rattle;
I bound me for the battle,
Right fierce against the foe,
'Tis therefore bound I so."
Hurrah!

Rest in thy narrow mew, love,
What would'st thou here, my true love?
Still in thy chamber be;
Wait till I call for thee.
Hurrah!

"Let me no longer tarry!
Blest garden, where we marry!
With roses bloody red,
And blossoming with dead!"
Hurrah!

Forth then, my iron beauty!
Forth to thy deathful duty!
Out, out, my good sword, come!
Come to thy bridal home!
Hurrah!

"O goodly 'tis, when, glancing
O'er bridal squadrons prancing,
In the broad noon-tide beams
The wedded falchion gleams!"
Hurrah!

Up, then, nor slumber coldly!
Up, German warriors, boldly!
Take each, his heart to warm,
His true love in his arm!
Hurrah!

Late on his left, all lonely,
She stole shy glances only;
Proud in his right hand, now,
She plights the bridal vow!
Hurrah!

Then each, his spouse caressing,
Her iron lip be pressing;
And wo the wretch betide
Whoe'er deserts his bride!
Hurrah!

Now be my true love singing!
Now the bright sparks be springing!
Stern dawns the bridal day!
My iron bride, away!
Hurrah!

THE DEAF GIRL.

ANNE A. FREMONT.

He speaks to them God's word,
For all are fix'd in mute attention now,
And not a lip is stirr'd,
But joy sits smiling on each gentle brow,
And o'er each cheek has stol'n a brighter hue—
Oh! that I could but hear those glad words too.

A mournful fate is mine;
To live in this fair world, to see, to feel
How all things are divine—
A deathless and pervading spirit steals
Throughout all Nature—a deep soul, a voice—
But I can never hear earth's things rejoice.

And, when young children bring
Bright buds and flowers from the sunny dell,
Where the cool fountains spring,
And of their wand'rings in the green woods tell,
I try upon their brow each word to trace—
I can but know them by the speaking face.

I bow my head down low,
E'en to the beautiful and quiv'ring lip,
With a vain hope: ah, no!
The rock hears not the sunny waters drip.
I turn away heart-sick with grief, to sigh—
Unheard by me the joyful melody.

My mother bends to speak,
I see her moving lip, I feel her breath
Come warm against my cheek—
How yearns my soul, but all is still as death;
With moist uplifted eye she turns away—
Alas! I cannot even hear her pray.

Pop Gathering.

HOP-GATHERING.

THE elegant Illustration of Hop Gathering which adorns our pages this week, was taken from a scene in Kent last autumn, by that eminent Artist, Mr. WEIGALL, and for the spirited and faithful manner in which it has been engraved, we are not less indebted to the able workmanship of Mr. JAMES COOPER. The Original Painting was exhibited in the Collection of the New British Water Colour Society of this year. During the season of hop-picking, two distinct classes may be found employed;—the one consisting of persons who usually arrive from Ireland, and other parts of our own country, in fact, emigrate into Kent and Sussex for that purpose; and the other—of which the present engraving is descriptive—the small farmers and cottagers of the adjacent villages, who, during the season, shut up their houses, and adjourn, men, women, and children, including even the babies, to the neighbouring gardens, where, forming themselves into companies, they toil together the whole day, and in the evening divide the produce of their earnings amongst the different families employed in each group.

MEMOIR OF JOHN WALTER, ESQ.

ALTHOUGH it has not been our custom to occupy the pages of this Magazine with obituary notices, (such articles, however gratifying they may be to the feelings of a few individuals, seldom possessing much general interest,) we feel sure our readers will forgive us for departing from this rule on the present occasion, when the event to which we are about to call their attention is one which we should conceive no member of the reading public can regard with indifference. We allude to the death of John Walter, Esq., for four-and-forty years editor, and part proprietor of *The Times* newspaper, a journal which has attained a degree of celebrity and an extent of circulation wholly unprecedented, and which may, in great measure, be attributed to the active zeal, indomitable perseverance, and well directed enterprise of the chief director of this mighty engine. The triumphant success which has attended these efforts may not be considered a fair proof, though, practically, we believe it to be a tolerably certain one, of the skill and judgment by which they were directed; but if any further clue be wanted to the secret of this success, it may be found in the steady power which a consistent adherence to the principles of strict justice, and high integrity, will always obtain over the minds of men. We are indebted to the columns of *The Times*, of the 29th July, for the following sketch of his early political career, given in an article written (by himself we imagine) in reply to an intemperate attack made by Mr. Wyndham, in the year 1810, upon the press and its conductors:—

“The joint proprietor and exclusive manager of this paper became so in the beginning of the year 1803. On his commencing the business, he gave his conscientious and disinterested support to the existing administration—that of Lord Sidmouth. The paper continued that support of the men in power, but without suffering them to repay its partiality by contributions calculated to produce any redaction whatsoever in the expense of managing the concern; because, by such admission, the editor was conscious he should have sacrificed the right of condemning any act which he might esteem detrimental to the public welfare. That administration, therefore, had, as he before stated, his disinterested support, because he believed it then, as he believes it now, to have been a virtuous and upright administra-

tion; but not knowing how long it might continue so, he did not choose to surrender his right of free judgment by accepting of obligations, though offered in the most unexceptionable manner.

“This Ministry was dissolved in the spring of 1804, when the places of Lord Sidmouth, Lord St. Vincent, &c., were supplied by Mr. Pitt, Lord Melville, &c. It was not long before the Catamaran expedition was undertaken by Lord Melville; and again, at a subsequent period, his Lordship's practices in the Navy Department were brought to light by the 10th Report of the Commissioners of Naval Inquiry. The editor's father held at that time, and had held for eighteen years before, the situation of printer to the Customs. The editor knew the disposition of the man whose conduct he found himself obliged to condemn; yet he never refrained a moment, on that account, from speaking of the Catamaran expedition as it merited, or from bestowing on the practices disclosed in the 10th Report the terms of reprobation with which they were greeted by the general sense of the country. The result was as he had apprehended. Without the allegation of a single complaint, his family was deprived of the business, which had been so long discharged by it, of printing for the Customs—a business which was performed by contract, and which, he will venture to say, was executed with an economy and a precision that have not since been exceeded. The Government advertisements were at the same time withdrawn.

“On the death of Mr. Pitt, in January, 1806, an administration was formed, containing a portion of that preceding ministry which the editor had so disinterestedly supported on his undertaking the management of the paper. It was by one of these that he was directed to state the injustice that had been sustained in the loss of the Custom-house business. Various plans were proposed for the recovery of it; at last, in the following July, a copy of a memorial, to be presented to the Treasury, was submitted to the editor for his signature; but believing, for certain reasons, that this bare reparation of an injury was likely to be considered as a favour entitling those who granted it to a certain degree of influence over the politics of the journal, the editor refused to sign, or to have any concern in presenting the memorial. But he did more than even this; for, finding that a memorial was still likely to be presented, he wrote to those from whom the restoration of the employment was to spring, disavowing on his part (with whom the sole conducting of the paper remained) all share in an application which he conceived was meant to fetter the freedom of that paper. The printing business to the Customs has, as may perhaps be anticipated, never been restored.

“The editor will now speak of the oppression which he has sustained while pursuing this independent line of conduct. Since the war of 1805, between Austria and France, his arrangements to obtain foreign intelligence were of a magnitude to create no ordinary anxiety in his mind respecting their result; yet, from the period of the Sidmouth administration, Government from time to time employed every means in its power to counteract his designs, and he is indebted for his success only to professional exertion, and the private friendship of persons unconnected with politics. First, in relation to the war of 1805, the editor's packages from abroad were always stopped by Government at the outposts, while those for the Ministerial journals were allowed to pass. The foreign captains were always asked by a Government officer at Gravesend, if they had papers for *The Times*. These, when acknowledged, were as regularly stopped. The Gravesend officer, on being spoken to on the subject, replied, that he would transmit to the editor his papers with the same punctuality as he did those belonging to the publishers of the journals just alluded to, but that he was not allowed. This led to a complaint at the Home Secretary's office, where the editor, after repeated delays, was informed by

the Under Secretary that the matter did not rest with him, but that it was even then in discussion, whether Government should throw the whole open, or reserve an exclusive channel for the favoured journals; yet was the editor informed that he might receive his foreign papers as a *favour* from Government. This, of course, implying the expectation of a corresponding favour from him in the spirit and tone of his publication, was firmly rejected; and he, in consequence, suffered for a time (by the loss or delay of important packets) for this resolution to maintain, at all hazards, his independence.

"The same practices were resorted to at a subsequent period. They produced the same complaints on the part of the editor; and a redress was then offered to his grievances, provided it could be known what party in politics he meant to support. This, too, was again declined, as pledging the independence of his paper; and, be it observed, respecting the whole period during which the present conductor has now spoken, that it was from no determinate spirit of opposition to Government that he rejected the proposals made to him. On the contrary, he has on several, and those very important occasions, afforded those men his best support, whose offers, nevertheless, at any time, to purchase, or whose attempts to compel that support, he has deemed himself obliged to reject and resist. Nay, he can with great truth add, that advantages in the most desirable forms have been offered him, and that he has refused them."

"This extract will suffice to show the arduous position in which the manager of such a journal as *The Times* is placed, and the difficulties and temptations with which he has to contend—difficulties which nothing but the highest mental qualifications could enable him to overcome. Of Mr. Walter's later political career we need say but little; with its leading feature, his unyielding crusade against the New Poor Law, and the indefatigable perseverance with which he hurled article after article at the devoted heads of the Somerset House Commissioners, and those who had set them in authority, our readers are not now to be made acquainted; suffice it to say, while the ranks of its defenders were daily thinned, those of its opponents increased in like proportion, until in the chamber of sickness Mr. Walter had the satisfaction of learning that there was scarcely a parliamentary candidate who did not pledge himself to oppose the inhumanities of that law, against which he had so long waged war single-handed. Before we quit the subject, we cannot forbear calling the attention of our readers to a fact which in memory throws us back to the bright old days of chivalry, when a dead Douglas won the field—we allude to the unprecedented way in which the mere *prestige* of his father's name has gained for Mr. J. Walter the election of Nottingham."

We offer no apology to our readers for presenting them with another extract from the same source, as the account of the manner in which Mr. Walter introduced the stupendous invention of the steam printing-press is in itself so interesting as to render such a proceeding superfluous. After telling how he obtained news of the capitulation of Flushing forty-eight hours before the government of the day, *The Times* proceeds:—

"But one achievement alone is sufficient to place Mr. Walter high in that list which the world, as it grows older and wiser, will more and more appreciate—

"*Inventas aut qui vitam excoluere per artes,
Quique sui memores alios fecere merendo.*"

He first brought the steam-engine to the assistance of the public press. Familiar as the discovery is now, there was a time when it seemed fraught with difficulties as great as those which Fulton has overcome on one element and Stevenson on another. To take off 5,000 impressions in an hour was once as ridiculous a conception as to paddle a ship fifteen miles against wind and tide, or to drag in that time a train of carriages weighing 100 tons fifty miles. Mr. Walter, who,

without being a visionary, may be said to have thought nothing impossible that was useful and good, was early resolved that there should be no impossibility in printing by steam. It took a long time in those days to strike off the 3,000 or 4,000 copies of *The Times*. Mr. Walter could not brook the tedium of the manual process. As early as the year 1804 an ingenious compositor, named Thomas Martyn, had invented a self-acting machine for working the press, and had produced a model which satisfied Mr. Walter of the feasibility of the scheme. Being assisted by Mr. Walter with the necessary funds, he made considerable progress towards the completion of his work, in the course of which he was exposed to much personal danger from the hostility of the pressmen, who vowed vengeance against the man whose innovations threatened destruction to their craft. To such a length was their opposition carried, that it was found necessary to introduce the various pieces of the machine into the premises with the utmost possible secrecy, while Martyn himself was obliged to shelter himself under various disguises in order to escape their fury. Mr. Walter, however, was not yet permitted to reap the fruits of his enterprise. On the very eve of success he was doomed to bitter disappointment. He had exhausted his own funds in the attempt, and his father, who had hitherto assisted him, became disheartened, and refused him any further aid. The project was therefore for the time abandoned.

"Mr. Walter, however, was not the man to be deterred from what he had once resolved to do. He gave his mind incessantly to the subject, and courted aid from all quarters, with his usual munificence. In the year 1814 he was induced by a clerical friend, in whose judgment he confided, to make a fresh experiment; and accordingly the machinery of the amiable and ingenious Koenig, assisted by his young friend Bauer, was introduced—not, indeed, at first into *The Times* office, but into the adjoining premises, such caution being thought necessary from the threatened violence of the pressmen. Here the work advanced, under the frequent inspection and advice of the friend alluded to. At one period these two able mechanics suspended their anxious toil, and left the premises in disgust. After the lapse, however, of about three days, the same gentleman discovered their retreat, induced them to return, showed them to their surprise their difficulty conquered, and the work still in progress. The night on which this curious machine was first brought into use in its new abode was one of great anxiety, and even alarm. The suspicious pressmen had threatened destruction to any one whose inventions might suspend their employment—'destruction to him and his traps.' They were directed to wait for expected news from the continent. It was about six o'clock in the morning when Mr. Walter went into the press-room, and astonished its occupants by telling them that '*The Times* was already printed by steam! That if they attempted violence there was a force ready to suppress it; but if that they were peaceable, their wages should be continued to every one of them till similar employment could be procured;—a promise which was, no doubt, faithfully performed; and, having so said, he distributed several copies among them. Thus was this most hazardous enterprise undertaken and successfully carried through, and printing by steam on an almost gigantic scale given to the world. On that memorable day, the 29th of November, 1814, the following announcement appeared in *The Times*:—

"Our journal of this day presents to the public the practical result of the greatest improvement connected with printing since the discovery of the art itself. The reader of this paragraph now holds in his hand one of the many thousand impressions of *The Times* newspaper, which were taken off last night by a mechanical apparatus. A system of machinery almost organic has been devised and arranged, which, while it relieves the human frame of its most laborious efforts in printing,

far exceeds all human powers in rapidity and despatch. That the magnitude of the invention may be justly appreciated by its effects, we shall inform the public, that after the letters are placed by the compositors and enclosed in what is called the form, little more remains for man to do than to attend upon and watch this unconscious agent in its operations. The machine is then merely supplied with paper—itself places the form, inks it, adjusts the paper to the form newly inked, stamps the sheet, and gives it forth to the hands of the attendant, at the same time withdrawing the form for a fresh coat of ink, which itself again distributes, to meet the ensuing sheet, now advancing for impression; and the whole of these complicated acts is performed with such a velocity and simultaneousness of movement that no less than 1,100 sheets are impressed in one hour.

“That the completion of an invention of this kind, not the effect of chance, but the result of mechanical combinations methodically arranged in the mind of the artist, should be attended with many obstructions and much delay, may be readily admitted. Our share in the event has indeed only been the application of the discovery under an agreement with the patentees to our own particular business; yet few can conceive—even with this limited interest—the various disappointments and deep anxiety to which we have for a long course of time been subjected.”

“From that day to the end of his life Mr. Walter never ceased to improve on the original plan; and if we should soon be able to accelerate the press considerably but safely beyond its present speed, we shall be indebted to him and those whom he employed, for that result.

“As a step in the progress of civilization, the steam press can only be compared to the original discovery of printing itself. Had it not been for that timely invention, literature and information must have been restricted in their growth, and still more in their extent, by the labour, expense, and delay incident to the multiplication of copies; and that at a time when the human mind was preparing for its mightiest efforts. When one copy of even a small book was the work of many days, it is evident that the mass of mankind must be strangers to all novelty in literature. Forty years since the world had come again to exactly the same sort of stand-still. If the pressmen of the daily journals had continued their labours till one day's ‘form’ was replaced by the next, they could only have supplied the wants of a certain limited class. Steam gave wings to the press, enlarging its powers to the scale of the world. It has enabled the metropolitan press to issue an adequate supply for all England, even before the inhabitants of the metropolis itself have assembled at the breakfast table. By this potent aid we printed and circulated fifty thousand copies of our paper, containing Sir Robert Peel's celebrated speech announcing the repeal of the Corn Laws, in the course of the following morning.

“We have little more to add. About a year since, Mr. Walter became aware of the first symptoms of the painful complaint which was destined to end the career of one whose life had proved so eminently useful to the country which had given him birth. After many months of suffering, he expired at his residence in Printing-house-square, on Wednesday, the 28th of July.”

THE MAIDEN AUNT.—No. IV.

CHAP. I.

“BEAUTIFUL!—yes, there can be no doubt that she is very beautiful; her face is absolutely faultless, and her figure magnificent. But it gives me no pleasure to look at her;—her manifest self-consciousness destroys the charm at once. It is always so with perfect beauties;—you may be forced to *admire*, but you are not

fascinated. They are like Pope's poetry;—all possible care seems to have been lavished on the form, but the soul has evaporated during the process.”

A common-place observation enough, reader. Can you guess the sex of the speaker? According to all conventional rules,—and it is by those that the world walks,—it ought to be a lady. The prime article in the creed of that great complex, hollow-hearted rationalist, Society, is a belief that women love delicately to detract from each other's merits. Not a man in the world, who has outlived the noble credulousness of his youth, (which, trust me, comes ever nearer to the truth than the shallow unbelief of after years,—just as the man who walks blindfold towards a tree is more likely to reach it than he who goes in an opposite direction, with his eyes wide open,) but thinks that his safest mode of recommending himself to any woman is to proclaim his indifference to the attractions of another. And what do the ladies all the while? They tolerate it, as an attempt to please, however mistaken, and they laugh inwardly to think how little the mystery of their hearts is comprehended by those who seek to win them.

Exactly thus felt Mrs. Dalton, while listening to the observation which we have just recorded;—perhaps a secret consciousness that she herself possessed, in the highest degree, the species of fascination alluded to, rendered her peculiarly alive to its meaning. The speaker was Sir Mark Wyvil, a middle-aged baronet, of unimpeachable fashion, laboriously attractive, and resolutely youthful. The subject of his criticism was Edith Kinnaird.

Her third season had just drawn to a close, having consisted, like the two which preceded it, of a series of uninterrupted triumphs, a perpetual incense of admiration. She was now staying at Selcombe Park, the noble owners of which had assembled a large circle of guests, to beguile the tediousness of a magnificent autumn in a beautiful country. Lord and Lady Selcombe were amiable, respectable, and moderately pleasant people; they had great wealth, of which they duly expended a reputable fraction in charities, public and private; the gentleman was a regular attendant in the House, a most affable president of agricultural meetings, a hearty Tory, a steady church-goer, (on Sundays,) and a profound hater of “the Oxford theology,”—in short, the popular ideal of a country gentleman could scarce have found anywhere a better embodiment. The lady was *passée*, but elegant—of toilette studious and elaborate; she patronised district societies and charity bazaars; was frequently heard to lament that she lived in such a whirl of engagements that she had no leisure for any serious pursuit; kept a first-rate governess for her daughters; worked a pair of slippers annually for her husband; and was esteemed by all her acquaintance “a pattern wife and mother.” The other members of the party at Selcombe Park shall speak for themselves as they are introduced to the reader. Yet we must bestow one word on Mrs. Dalton ere we proceed to record her answer to Sir Mark Wyvil's observation. She was, by some, considered a *little too blue to be feminine*—Heaven forbid that we should unravel all the meaning of that phrase, or develop all the consequences which it involves!—but even this worst sin in woman was tolerated, for the sake of the fascinations which accompanied it. She might perhaps have seen thirty summers, but her attraction depended not on feature or complexion, and was rather increased than impaired by time. Its elements consisted in the singular gracefulness of her figure, movements, and manners, the varying expression of her large dark eyes, the only really fine feature which she possessed, the ready, ringing laugh, musical as that of childhood, and that rarest, and perhaps most winning of all gifts—perfect melody of voice. For these she was forgiven if she presumed to discourse of literature at a dinner party, and to know a little more of art than most of the men who devoted themselves to her. Yet, even these would

scarcely have preserved her from the danger of being secretly voted a bore, had she not added to them the charm of a vanity sufficiently under discipline to avoid offensiveness, sufficiently evident to save her friends from the painful necessity of compelled respect. She was accessible to delicate flattery, capable of refined coquetry, pleased with attention, and always ready to glide from literature to playfulness—from playfulness to sentiment, at least in the social sense of the term. She was therefore charming; and when we add that her voice was as bewitching in singing as in speaking, her talent for music so remarkable as to be recognised even in these days when education labours to bring all students up or down to the same level of undistinguishable but cultivated mediocrity, it will be at once allowed that she was irresistible. We have here sketched the external development of her character—heart, mind, and soul, (if she has them,) must be left for a more gradual discovery. Her husband was a member of Parliament, still engaged with his duties, though it was the second week of August. They had been married several years, but had no children.

With a slightly sarcastic expression in her beautiful eyes, she rejoined,—"A stronger proof of the omnipotence of Miss Kinnaird's claims could scarcely be found than that she has inspired Sir Mark Wyvil with a simile."

The sting of the words was neutralized by the smile with which they were spoken, and Sir Mark, drawing his chair very decidedly forwards, seemed to be preparing himself in a business-like manner for a playful encounter of wits, when he was checked by the entrance of Miss Kinnaird herself.

She came from the garden, laden with flowers. A scarf, hastily substituted for a bonnet, was twisted round her head, the ends falling on her shoulders; her delicate colour flushed into crimson with the exertion of her late employment; her hands full of roses. Since we last saw her, her marvellous beauty has matured into a steadier brilliancy, her step has acquired something of stateliness, her manner something of composure, blended with a more even vivacity; the world admires her ten times as much as it used to do, for the last lingering tint of the glory of childhood has faded away,—and childhood is a mystery and a wonder,—and the world does not like mysteries, and is far too well educated to wonder at anything.

Two gentlemen advanced from opposite sides of the room—the one from a book, the other from a lounge—to relieve her of her fragrant burden. Sir Mark Wyvil lifted his cold critical eyes to her face, and then turned to Mrs. Dalton with an expressive smirk (for such a man cannot smile,—there is heart in a smile). In every gesture and movement of poor Edith,—in the manner in which she resigned her flowers to her two assiduous squires, in the tone with which she declared herself tired, in the careless grace with which she threw herself upon the nearest chair, in the little pause which intervened ere she removed her unwonted head-dress,—he saw only the panoply of conquest, consciously assumed and used for a purpose. His discernment was lost on Mrs. Dalton, however, for she had joined her younger friend at the table, and was helping her to sort the flowers. Few things had more entirely gratified Edith than the manner in which Mrs. Dalton had singled her out from the circle at Selcombe Park, with the apparent resolution of making her a friend. To a girl of intelligence, enthusiasm, and warm affections, the caressing demeanour of the first woman of genius with whom she had ever come in contact, was absolutely irresistible, and she repaid it with a kind of uncalculating idolatry, which effectually secured its continuance. The influence which Mrs. Dalton thus acquired was of somewhat dubious advantage to the character of her admirer; for if the delicious sophistry of love should fail in making all she did and said appear "wisest, virtuous, discreetest, best," the danger was

rather that Edith would learn to undervalue wisdom, virtue, and discretion, than that she would approach to any distrust of the perfection of her idol. Aunt Peggy would have been alarmed, could she have witnessed this period of her darling's mental history; but her alarm would have been groundless. The exercise of hearty love and admiration, if only the object be in the main good and admirable, is, in itself, the most ennobling process to which the spiritual part of man's nature can be subjected. Let all who are around the young, or around those whom any peculiarity of temperament preserves in the youth of their hearts to a later period of life, beware how they shut up this sweet fountain or turn it into bitterness by ridicule, by surprise, by criticism, by contradiction, or by cold withdrawal of sympathy. Lose not the glory of a sunset by seeking to count the spots in the sun. We confess that they are there, if you will force us to the confession; but we are not thinking about them, and we do not mean to look at them;—suffer us to take the beauty and goodness of God's works into our inmost hearts!

"Miss Kinnaird," said one of the two gentlemen who were hovering around the chairs of that lady and Mrs. Dalton, "how does the diary proceed? and when are you going to fulfil your promise, and read us the events of a whole day?"

"When they are written," returned Edith, laughing. "What a gigantic idea you must have of my powers, both bodily and mental, if you think I have strength enough left to make an entry in my diary, after danceling as I have done every night since I came here!"

"Is it a green book with silver clasps?" pursued the questioner.

"Yes," answered Edith, a little puzzled.

"Then I have seen it!" exclaimed he, triumphantly.

"I passed under the window of your room after breakfast this morning: the table was standing in the window, and I saw a green book with silver clasps upon it. It was lying by a pocket-handkerchief with a lace border, and a white kid glove, trimmed with blue, was lying in a heap with it. Yes!" continued he, accumulating the evidence, "there were two roses in a china vase, and a gold vinaigrette, and a sash, checked white and lilac. I said to Vaughan, at the moment, 'I am quite sure that is Miss Kinnaird's diary.' He did not think it was, but I felt quite sure."

The smile with which Edith looked up at Lord Vaughan, as this speech was concluded, proved that, on her side at least, all unpleasant recollections connected with the event of three years ago had passed away. Whether it also betokened a lurking consciousness that her power was undiminished, we will not determine.

"I am not by any means certain that you are right," observed she, gravely addressing the speaker, whose eyes opened to their widest extent, in pure astonishment.

"O! my dear Edith," cried Mrs. Dalton, "you do not know what a dangerous thing it is to contradict Mr. Delamaine. His accuracy is positively unbounded. I don't believe he ever was mistaken in a date, a name, or a number, in his life."

"Well," said Mr. Delamaine, visibly delighted, "I do believe I am tolerably accurate. That is the habit of mind which I have always laboured to acquire. I could tell you some curious traits relative to that very subject,—I mean, the accuracy with which Mrs. Dalton is good enough to say that I remember even the most trivial occurrences. Remind me"—turning to Lord Vaughan—"to tell you a story about a pair of ear-rings, and the way in which I recollected something. It is not exactly *apropos* just now; but I dare say we shall resume the conversation."

Lord Vaughan promised to remind him, with the air of a well-bred victim, and Mr. Delamaine proceeded, "Thornton always used to remark, 'if memory be not accurate, it is worthless.' I remember perfectly

the occasion upon which he said that.—He was saying, that he had painted a hundred and fifteen portraits since he began his career as an artist, out of which there were only three which had satisfied him. I said he had painted a hundred and sixteen, and I offered to recount the names of the sitters. He didn't wish me to do it; but I did, though, after the first twenty or so, I required a little reflection to bring each name to my remembrance. It was at a dinner-party, and, long before I finished, Thornton and I, and our good host, who was dozing in his arm-chair, were left quite alone; however, I went through the whole number, and it was as we crossed the hall to take our leave of the ladies, —for it was getting very late—that he made the remark which I have just now quoted."

"You were correct, then," said Edith, politely.

"Why, no, not exactly—that is to say, I was correct in remembering all the names, which was, after all, the great thing, you know,—but there were only a hundred and fifteen of them; so Thornton was right there."

"That gives a somewhat different colouring to his observation," observed Mrs. Dalton, in a very low tone of voice, to Edith, as she stooped over her flowers.

"I found out afterwards," continued Mr. Delamaine, "how I had added that hundred and sixteenth. He had painted the same portrait twice—you know that was a very satisfactory sort of thing—I must say that it gratified me, for I was altogether at a loss to know how I had contrived to make the confusion. I offered afterwards to give the names in the order in which they had really presented themselves; but Thornton wouldn't take the bet. I suppose he felt sure of losing."

"Time or money," said Mrs. Dalton, with an arch look at Sir Mark Wyvil.

"Ah! time," cried Lord Vaughan; "that brings us back to the diary, you know. Have you much waste of time to chronicle, Miss Kinnaird?"

"That is scarcely a fair question to ask a young lady," interposed Lady Selcombe, who was comfortably ensconced in a bay window, embroidering a spaniel on a footstool in livid and unearthly hues, which suggested that you were setting your feet on the discoloured corpse of a dog, whose profile, moreover, seemed to have been much battered by frequent crushing; "trifles, I am afraid, generally make the sum of human things at that age." And Lady Selcombe glanced with good-natured condemnation at the group round the table, and then looked complacently down upon her work, feeling convinced that embroidering dogs was a much fitter occupation for an immortal soul than contemplating flowers.

"I fear I must plead guilty," said Edith, looking from one of her admirers to the other with a playful ease very unlike penitence. "But before I begin my confession, do tell me who Mr. Thornton is, and whether it is the same Mr. Thornton who is coming here to-day."

"Thornton! coming here!" cried Mr. Delamaine; "Good heavens, how extraordinary! My dear Miss Kinnaird, you could not have applied to a better person than myself to tell you all about Thornton; for I think I may venture to say that he is one of the most intimate friends I have in the world. If you will allow me, I will tell you his whole history."

Edith looked imploringly at Mrs. Dalton, who instantly came to her rescue.

"I protest against this!" cried she to Mr. Delamaine. "You are not to speak on the subject at all. Mr. Thornton is my cousin, and I claim the right of kindred as giving me precedence in the matter."

"But, my dear lady—" cried the rebuked orator.

Edith playfully held a rose against his lips, so as to stop the torrent of words. He accepted the flower with a bow and a gratified smile, as though he felt that the favour accorded was so great as to pledge him to observance of the terms on which it was granted; and Mrs. Dalton commenced her history at once, as fearing that the pause would not be of long duration.

"My cousin Godfrey Thornton," said she, "is young, rich, of good family, handsome, and a genius."

"And coming here!" added Edith; "that completes the list of his attractions. I heard Lord Selcombe tell Mr. Davis so, as they passed to the stables, while I was gathering my flowers."

"But if he is rich and of good family," inquired Lord Vaughan, "how comes he to be an artist?"

Mrs. Dalton's eyes kindled into more than common brilliancy. "Oh, what an *English* observation!" exclaimed she. "He is an artist because God made him one, and he has neither the power nor the will to unmake himself."

"Then he lives for art!" cried Edith, with a sudden burst of her old romance; "and has given up the world's life, though, with all the attractions which you have enumerated, it would have been to him nothing but triumph and enjoyment. He ought to have a tower like Balta's in *Minstrel Love*, where, in the midst of the grandeur and beauty of nature, he might be a true artist-hermit, and forget men and women altogether. How delightful! He must be quite an ideal character."

"Quite!" responded Sir Mark Wyvil, coolly. "He 'lives for art' at No. 15, Green-street, Grosvenor-square, and studies nature from his drawing-room windows."

"My dearest Edith," said Mrs. Dalton, a little impatiently, "that is one of your pretty heresies of which I have not yet been quite able to cure you. You seem to have a sort of vague, unpractical idea, that a man must needs withdraw from the world in order to achieve anything really great. Now I, on the contrary, believe that society is the very food and stimulus of genius, which droops without it, grows morbid, and loses both the creative power and the power of self-measurement."

"Long may the idea continue unpractical," exclaimed Lord Vaughan, answering the only part of Mrs. Dalton's speech which was within the limits of his comprehension, "if Miss Kinnaird meditates achieving greatness in her own person!"

"Why, yes," replied Edith, "I confess I have no inclination to shut myself up in a hermitage. That would be rather too high a price to pay for any sort of greatness."

She did not speak exactly as she *felt*—but there was no discrepancy between the words and the manner in which she *lived*. How long would the world, which had already divorced the outer life from the inner thought, leave the thought unmolested?

"There is only this difference," said Sir Mark, with studious sportiveness; "to shut Mr. Thornton up in a hermitage would be an act of cruelty to an individual, but to immure Miss Kinnaird would be punishing the world."

(To be continued.)

MORAL REFLECTIONS; OR, ESSAYS ON MEN, MANNERS, &c.¹

BY MADAME GUIZOT.

On Man and Human Life

ON EDUCATION.

"We have all been brought up without that," say the greater number of those who hear of any plan that will simplify or facilitate education. It is precisely because you have been brought up with means that were less easy and less advantageous that you should believe that in point of education every means are good to those who know how to make use of them. Methods of education are instruments in the hands of a good

workman; and what workman will complain of seeing the instruments of his trade increase, were it only that he might make a choice of them? It would, nevertheless, be a strange idea, to desire that the instruments should work by themselves; it is, however, what is expected by the greater number of inventors of methods. As soon as they have discovered one, the work of education is, in their opinion, completely finished, or rather is rendered useless. They look upon a child, armed with their method, as a machine which, once set in motion, will never stop until it has fulfilled the object of its destination, and would be tempted to say to the teacher who sought to aid the movement, "What business have you to interfere?" I certainly would interfere,—it would concern me to consider a little before I would put a pack of mythological cards into the hands of a child, in which they are taught the history of Venus and Adonis, and some other adventures of the mother of Love. I will not believe that with a pack of historical cards they can by themselves learn the New Testament; for I will look, for instance, at the card which gives an account of the Sermon on the Mount, for some observation on those words so calculated to strike the minds of children,—“If thou bring thy gift to the altar, and there rememberest that thy brother hath aught against thee, leave there thy gift before the altar and go thy way; first be reconciled to thy brother, and then come and offer thy gift.” And in place of that, I shall simply find that in this sermon Jesus Christ recommends union and reconciliation. When I should see in the cards of Roman history, on the subject of the marriage of Tarquin and Tullia, that “from this monstrous alliance nothing but monsters could be born,” I would endeavour to let the minds of my little readers dwell as shortly as possible on expressions of this kind, which, containing only ideas beyond their capacity, would present them with words without ideas; but by scarcely ever adopting the explanatory passages contained in those cards, I would take advantage of them to explain to the children what I wished them to know; they should be an itinerary of my route, in which I should reserve to myself the right of walking at what pace I pleased, without prohibition of either resting or rambling. A game, however simple it may be, can be made profitable in the hands of those who know how to make use of it; but I confess that it is thereto that, in my opinion, the pretensions of the greater number of the best combined methods should be limited. If they facilitate instruction, it is by pointing out the method of teaching rather than the method of learning; their object should be to assist the master rather than the pupil; if they assist the latter, it is by supporting the arm which leads him; and they will assist the former by affording him the means of doing better,—not of doing less. It is not to the mind,—it is not to the feelings of children that we should first apply; their imagination is the only one of their faculties of which you can really dispose; the others perpetually escape you by their inconstancy and tenuity.

It is even to the unsteadiness of the imaginations of children that you are indebted for the power of directing them; nevertheless, without continual attention, what will indicate the point at which it is ready to escape you? What will teach you the right idea at which to stop and fix his attention, if an intimacy with every moment of the child's life, with his plays, his pleasures, his troubles, and all the little events of his day, does not enable you to seize that fit opportunity which the wisest method will not supply, but which the least skilful mother can turn to advantage? Of all the theories of education, I do not believe there is one that can be equivalent to the continual action of that gentle power, ever intent upon rectifying the wanderings before they become too difficult to repress, in proportioning the object that it may not be too difficult to attain, in assisting the little successes which en-

courage, in anticipating even to the fear of a fall, so that the pupil, supported before he feels himself in danger, learns to lean with confidence upon his guide, without being aware of all the weakness which renders the support so necessary. But in those cases which relate more especially to early childhood, the most vigilant mother requires to be guided, or, at least, to be assisted. Should her heart not require to be guarded, or her judgment to be enlightened, her mind will require to be aided, in order to furnish her with means to satisfy the multiplicity of ideas which consume childhood. If the duration of time be measured to us by the number of our ideas, if a fixed idea render this duration almost insensible, while, on the contrary, a variety and rapidity of ideas give it sometimes an intolerable length, then certainly nothing can appear longer than a child's day. Weak in comprehending ideas, quick in exhausting them, in a very few hours he has run through the whole circle of his employments; new ones must be incessantly provided for him; we must incessantly labour to repel the weariness which produces impatience, caprice, and uneasiness, and weakens the bodily strength, by destroying the energy of the mind. Those who have never brought up children cannot comprehend of what importance it is to those who are engaged in such cares to be able to invent a quarter of an hour's additional amusement; but the importance is doubled, if from the amusement some instruction can be drawn. It has often been said that we ought not to make the lessons of children a play to them, and that of all the lessons they can be taught, the most important is that they should submit to necessity, and give up their will to that of others. As to that, we may make ourselves easy; opportunities enough will never be wanting. But if the lesson may not be a play, where would be the disadvantage of allowing the play to be a lesson, so that children might learn to attach to their amusements some serious idea? The danger of regular lessons is, that it places a wall of separation between the ideas of employment and pleasure, and attaches to the latter exclusively the idea of idleness, so that for children, the important time of their life—the only one that they can really call their own, is the time in which they do nothing; this is the only time to which they attach any interest,—the rest belongs to others,—they allow it to go as it will, and endeavour especially to lose it. We ought, on the contrary, to accustom children to look upon all their time as important to them, by forming them early to a regular course of life, to which recreation is an exception, and of which the customary pleasures are composed of more or less serious employments. A child should always be believed to be doing something useful, that he may imbibe the idea that it ought not to be otherwise; and nothing is more easy than to give him this idea. Seem to associate him with your employments, by sometimes joining in his; you will have done much to secure his attention when you have given him yours. That lack of ideas which continually torments him draws him incessantly towards those who are able to furnish him with new ones, and every point of contact between their mind and his, every employment which can be made mutual, is a benefit to both parties; but, it must be owned, that, as in many other cases, this aid is especially useful to those who are best qualified to dispense with it.

COUNTRY SKETCHES.

No. IV.

AN AUTUMN MORNING AT HAMPTON.

THERE are many passages in English history which create vivid impressions, not easily to be forgotten, in the minds and hearts of true Englishmen. It is not too much to say, that the perusal of these stirring occurrences has wrought many a wavering purpose

into stability, and excited the reader of our national chronicles to emulate our glorious predecessors in their path of fame and well-doing. Who does not feel proud of his countrymen when the brave deeds of days gone by rise up before him? Who can look back on many of those noble scenes, and not exult that England is his country? Not few nor far between, but constantly present in the annals of our ancestors, they present examples for all successive generations, and afford national illustrations of a people, ever recognised in the oldest traditions as courageous, and of a free and liberal spirit.

Happily for these our later days, wars and rumours of wars are becoming less and less heard of. Peace reigns around us; and an increase of civilization has brought in the train of its many blessings one scarcely yet sufficiently esteemed, the power of settling all differences by gentler means than the destruction and desolation of inimical interests. With what feelings of gratitude and happiness so tranquil a consummation should be viewed, let those attest whose avocations have enlisted them in some foreign clime for their country's cause; or those who have made mankind their study, and traced the springs and aims of human actions to their starting point, from thence downwards to their end. Public opinion no longer speaks by the aid of fisticuffs; we have done with such things, and a new and happier era has come. In days gone by, let us hope for ever, a different feeling prevailed; the sword and the strong arm too frequently by their might overcame the justice of a good cause. Might and power then constituted right; as the old song expresses it—

"That they should take who have the power,
And they should keep who can."

So were manners and matters in those times. Gradually, but surely, however, came a change; and when in later years, Charles I. attempted to obtain an impost, alike odious to peasant and peer, and endeavoured to use his royal prerogative to enforce his demands, England took its boldest step to resist the unwarrantable encroachment on a people's rights. The particulars of that contest are familiar to all. Amid the many admirable histories of the period, an impartial mind may glean the truth, and casting aside the broad and vague assertions of one class of writers, and the equally unfounded hypotheses of another, soon arrive at a just and satisfactory conclusion. The history of the Civil War, unlike that of many other struggles, stands out clearly and distinctly in the pages of almost every narrator and essayist on the subject. There is not much mystery in the great transaction. A monarch and his people ranged on opposite sides, and a people ultimately victorious. It is not too much to say, that of all the men who lived and moved in that eventful epoch, Hampden appears to have been influenced by feelings of the most patriotic nature, and to have acted with a vigour and determination, ever tempered with gentleness and forbearance. Had he lived, what a different ending would have closed that drama! Listen to his dying words; do they not breathe of loyalty and homage to his misguided king! Who can say that such a man would have consented or suffered Charles to have closed his career on the block? Hear him as the last words come feebly and falteringly forth! How well they attest the integrity and purity of his motives! "O Lord God of Hosts, great is thy mercy; just and holy are thy dealings unto us, sinful men. Save me, O Lord, if it be thy good will, from the jaws of death. Pardon my manifold transgressions. O Lord, save my bleeding country: have these realms in thy especial keeping. Confound and level in the dust those who would rob the people of their liberty and lawful prerogative. Let the king see his error, and turn the hearts of his wicked counsellors from the malice and wickedness of their designs. Lord Jesu, receive my

soul." His death took place a few days after the battle of Chalgrove Field, in which engagement he was mortally wounded.

The spot where the battle was fought has been recently indicated by a memorial, erected through the instrumentality of Lord Nugent and other of his admirers.

That all the memories of this great man will come crowding round the brain of him who wanders and who thinks in the leafy shades and woodlands of his last home, who muses in the old church of Hampden, in Buckinghamshire, or who treads the halls where Hampden lived and died, is but natural, and harmonises well with the ancient spirit of the place. It is truly a fair spot. The house, originally built in the Plantagenet fashion, has been altered and repaired from time to time. It stands on a fine eminence; is surrounded with lofty and noble trees, and adjoins the church, which is part and parcel of the domain. On one side are the Chiltern Hills, and the fields assessed for ship-money, which Hampden refused to pay. The view of the house opens through a vista, a mile and a quarter long. On either hand, stand elm, beech, and Spanish chestnut trees, of high dimensions. The estate comprises a boundary of nearly 5,000 acres; of this, there is a vast extent of arable land, and some beautiful woods, whose richness of foliage, seen in the fading autumn season, is suggestive of the life of a gentleman of old, whose amusement and occupations alternated in an agreeable succession. Books and running brooks, the cares of a farmer, the duties of a magistrate, the pleasures of field-sports, the higher gratifications of taste, and the activities of charity; in this wise did the patriot pass a pleasant life for eleven years,—a happy existence broken only by the death of his wife. The stirring events which so soon after happened roused the spirit of this enthusiastic man, who could not witness his countrymen bearing the wrongs that pressed them down tamely and unmoved. It may be very easily believed that the whole surrounding scenery is associated with the name and fame of Hampden. The mansion itself has a peculiar character of its own, and, though almost deserted by its present proprietor, bears striking impress of its ancient greatness. The hall is gloomy, and disfigured by several paintings, which are not only of indifferent execution, but are totally inconsistent with the place. The suite of rooms consists of a library, two dining-rooms, drawing-room, presence chamber, and state bed-room, on the ground-floor. They are handsomely furnished, and contain a few pictures of merit, but most of them in a sad state of neglect. A view of Venice, by Canaletti, has suffered grievous damage at the hands of the cleaner, and an exquisite head of Lely's seems to have become much affected by damp. In the drawing-room there is a chimney-piece of white marble, with figures of rustics, executed in alto-relievo; this, which deserves more than a hasty glance, was the production of an Italian artist, and was brought from Rome by Viscount Hampden.

In one of the apartments a large quarto Bible is shown as having been the property of Philip Cromwell, uncle of Oliver. It contains detailed entries of the names and births of many members of the Cromwell family. Elizabeth Cromwell, the Protector's aunt, married one of the ancestors of the patriot. The father of that Hampden was Griffith, high sheriff of Buckinghamshire, who entertained Queen Elizabeth in all costly style and splendour at Hampden, not only fitting up a room purposely for her reception, but employing an immense number of workmen to cut a passage through some very dense woods to allow her majesty to pass in the nearest possible direction. Such was the loyal homage and courtly devotion of the days of Queen Bess, who appears to have commanded respect, if she did not find love from all her subjects. This opening is still to be seen, and is known to all the neighbourhood as the Queen's Gap.

There are a great many family portraits scattered through the mansion. On the staircase is a whole-length of Oliver Cromwell; he is accoutred in armour, with helmet and truncheon. There is no mistaking who the artist meant. The stern determination of purpose, the calm forethought, and the hard-lined features, are unmistakable. It is to be regretted that the picture is in parts greatly injured by the damp. At no great distance is a fine portrait of one of the family, who is said to have destroyed himself in an adjoining chamber. This circumstance is alluded to in terms and tones of such solemn awe by the attending domestic, that the visitor is not surprised to be told afterwards that the room is believed to be haunted. In one of the principal apartments hangs a picture of a man about five or six-and-thirty, which was always said, though on assumption only, to be the resemblance of the great hero of his house. Some years back, Lord Nugent, when preparing his memorials of Hampden for the press, being in doubt upon a disputed point, caused the body of the patriot to be exhumed in his presence, permission having been accorded by the noble proprietor of this property. On unclothing the face, which was in fair preservation, two or three persons present were instantly struck with its resemblance to the picture in question. The grave has thus settled the identity, and it is therefore invariably looked upon as the likeness of Hampden.

Roaming through the forsaken old hall, which seems to be drooping in its faded splendour, all things about serve to testify of a past age; and the melancholy feeling is heightened if the visit be made on an autumn day, when the wind blows through every cranny and crevice, and the leaves of the stately trees without, half golden and half sere, fall one by one on the dewy grass, to mingle with the remnants of the passing season.

Strange to say, there are no papers or documents of any interest relating to Hampden to be found in the precincts of his dwelling-place,—nothing to assist in the elucidation of any one point in his history. So, passing to the church where he lies, there is there, too, no indication of the spot. No tablet, no effigy, no monumental stone, or marble of any kind. There is a memorial to the last John Hampden. It is profusely decorated with armorial bearings. On an oval medallion is a representation of Hampden falling from his horse at the battle of Chalgrove Field. There is a morion with the Hampden crest, and an inscription setting forth the relationship of the deceased to the Trevor family. Far more to our purpose, infinitely more interesting, is the epitaph written by Hampden to the memory of his beloved wife. It is upon a black marble tablet, placed between the windows of the chancel, underneath a coat-of-arms. As it is fair to presume that this is the composition of the regretful husband himself, the gentle record acquires a twofold attraction. It runs thus:—

"To the eternal Memory of the truly vertuous and pious Elisabeth Hampden, wife of John Hampden, of Great Hampden, Esq., sole daughter and heire of Edmund Symeon, of Pynton, in the county of Oxon, Esq. The tender mother of an happy offspring in 9 hopeful children.

In her pilgrimage

The state and comfort of her neighbours,
The love and glory of a well ordered family,
The delight and happiness of tender parents,
But a crowne of blessing to a husband

In a wife: to all an eternall patterne of
Goodness and cause of Joy; whilst shee was

In her dissolution

a loss unvaluable to each, yet herself blest, and they fully recompensed, in her translation from a tabernacle of claye and fellowship with Mortalls to a Celestiall Mansion and Communion with a Deity, the 20th day of August, 1634.

"John Hampden, her sorrowful husband, in perpetuall testimony of his conjugall love, hath erected this Monument."

The church, like the house, is embosomed in trees, and is seldom visited by any beside its seventh-day occupants. The locality is perfectly secluded, lying some distance from the two principal roads, and about equidistant from the Great Northern and Western railways. The Tring station is the nearest, and even that is twelve miles off. All the adjacent lanes and villages, not to say towns, are of the most rural description, and convey the impression of a rich agricultural district. In the quietude of such a scene, it is well to have nothing to break the contemplation of its former lord, and the occurrences in which he took so active a part. It has been truly observed by one of the greatest writers of our time, that the history of Hampden's life is the history of England during the period in which he lived. Whatever difference of opinion may exist as to the effects of his memorable opposition to the increasing encroachments of the crown, there can be none to the conviction that he was actuated by an honest love for the welfare of his country, the prosperity and happiness of his fellow-countrymen, and an ardent love for the blessings of liberty and social progress. To think of him amidst the groves where he wandered, in the halls where so often his footsteps fell, or in the hallowed fane where he lies, unconotaphed but not forgotten, is indeed a pleasure and a privilege. And few votaries ever sought a shrine more worthy of their seeking than the grave of this upright, conscientious man. Few excursions containing more of profit and pleasure combined can be taken than this, so picturesquely situated in one of the most retired districts of the county.

THE TEMPERATURE OF INSECTS.

In two former articles, on the temperature of the beehive in winter and in summer, it was shown, that bees maintain a degree of heat in their dwellings considerably above that of the external air. The same fact has been observed by Mr. Newport in the nest of the humble-bee in its natural haunts. The nest examined was situated in a shaded chalk bank, near the ground, and about eight inches from the surface. At ten o'clock, A.M., the temperature of the air in the shade, four feet from the ground, was nearly sixty-nine degrees; that of the exterior of the chalk bank, near the entrance to the nest, sixty-six degrees. On introducing a small thermometer very carefully into the nest, without disturbing the inmates, a temperature of eighty-three degrees was indicated, and this in a few minutes rose to eighty five degrees. Another nest, containing forty or fifty bees, was removed from the earth to Mr. Newport's residence, and placed in a small breeding cage. The bees were at first very irritable, and were therefore kept in close confinement, and fed with moistened sugar; but on the third day they became accustomed to their new abode, and were placed on a table in the sitting-room, near the window, which was left open, as was also the door of the cage, so that the bees might go abroad and return at pleasure, which they did with as much regularity as if the nest had been in its natural locality. The temperature of this nest varied considerably at different times, but was highest when the bees were excited. In a third nest, which was caged like the second, the bees were at first greatly affected and agitated by the slightest noise, such as the removal of a chair, or a footstep in the room, or the passing of a carriage along the road, thirty feet distant; but they were not in the slightest degree affected by persons talking loudly in the room, whilst a tap with the finger on the table put them immediately into a state of the greatest agitation. In two or three days they became accustomed to their situation, and were not disturbed by slight noises. When the temperature of the air was seventy and a half degrees, that of the box and nest was seventy-three degrees; but

when they were excited it rose to seventy-seven, but gradually subsided to seventy-three degrees as the bees became quiet. On another occasion, when greatly excited, a temperature of nearly twelve degrees above that of the air was observed.

An ants' nest, examined in its natural haunts, afforded still more remarkable results. The temperature of the air in the shade at eleven o'clock, A.M., was seventy-six degrees; when the thermometer was passed into the nest to the depth of five inches, it rose to eighty-four degrees, and remained steadily at that point; but in about six or eight minutes, the insects becoming excited, and running about in every direction in a state of great agitation, the temperature of the nest rose to ninety-three degrees: and soon after, when the insects were still more excited, to ninety-five and a half degrees, and a little nearer the surface, where the commotion was greatest, to ninety-eight and a half degrees. During these observations the ant-hill was carefully shaded from the sun; but when exposed to its influence, the thermometer rose to 108 degrees. This was a temperature much too great for the insects to bear; they all retired beneath the covering of the nest, and scarcely a single ant was to be seen. These observations, which were made on a fine day in July, were repeated on a gloomy, wet day in September, when the temperature of the air at eleven o'clock, A.M., was only fifty-four degrees, that of the nest at the depth of one inch was sixty-five, at two inches, sixty-six degrees, below which it gradually diminished. In another nest, twice the size of the first, observed at the same time, the thermometer stood twenty degrees above the temperature of the air, when the insects were a little excited.

It appears, then, that these communities of insects maintain a degree of heat in their dwellings considerably above that of the external air; such being the case, it would seem to follow, that every individual insect must maintain a separate temperature of body, higher than that of the surrounding atmosphere. In order to determine this point, Mr. Newport made an immense number of experiments upon insects in their different states and under various circumstances. The thermometers used in determining their temperature were of small size, with cylindrical bulbs, about half an inch in length. The method of taking the temperature of an insect was either by allowing it to remain with the soft ventral surface of the abdomen pressing against the bulb when in a state of rest, or by pressing the thermometer firmly against its body when in a state of excitement; and, in order that the heat of the hand might not interfere with the result, the insect was held during the observation between a pair of forceps covered with woollen, and the hand which held the thermometer was also covered with a glove. The temperature of the insect was always compared with that of the atmosphere at the time of observation. The temperature of active flying insects was taken by enclosing them singly in a small phial. The number of inspirations per second was noted, as was also the degree of activity of the insect, so as to be able to compare the amount of respiration with the heat evolved.

In examining insects in their different states it was found that the larva always evolved less heat than the perfect insect of the same species, supposing both to be similarly healthy and active. The larvæ of humble bees and some others were from two to four degrees above the temperature of the surrounding air, whereas the perfect insects were from three to eight or ten degrees higher, and when much excited the difference was even greater. The larva of the flesh-fly is seldom more than one and a half, and the perfect fly only two and a half degrees above the surrounding medium; but precise observations are difficult to be made on small insects, although easy enough on the large soft-bodied larvæ of sphyngeæ. On applying the bulb to a full-grown larva of the death-head moth, it showed a temperature of seven and a half degrees higher than

that of the air, but the insect was much excited by being disturbed; its general temperature when feeding is not more than three degrees above the air, and, when perfectly quiet and apparently asleep, the temperature is exactly that of the air. From a variety of observations it was evident that individual insects possess a temperature of body above that of the surrounding medium; that the amount of heat is not constant in the same insect, but varies according to certain conditions, which will be noticed presently.

In the nymph, or pupa state, the temperature of the insect is generally lower than at any other period of its existence, and is only equal to, or but very little above that of the surrounding medium; when disturbed their temperature rises somewhat above that of the air. The pupæ part with their natural heat with much greater rapidity than the larvæ, and this seems to be the reason why most hymenopterous insects select for their young those situations which are found to be the worst conductors of heat. This is why the mason-bee encloses its larvæ in cells constructed in the vertical sections of banks of earth which are exposed to the morning sun, and why hive and humble bees crowd over those cells which are about to produce the perfect insect, when the enclosed nymphs are most in need of increased warmth to invigorate them for the change they are about to undergo.

In the imago, or perfect insect state, the insect has a higher temperature than at any other period of its life, and when in a state of activity is not so much influenced by sudden changes of atmospheric temperature as in the larva or pupa state. The imago has also greater power of generating as well as of maintaining heat; but it is not till some time after an insect has assumed a perfect state that it is able to support its full temperature. When a lepidopterous insect leaves its pupa case with its whole body soft and delicate, and its wings undeveloped, and hanging uselessly by its sides, it parts so rapidly with heat, that it appears to have a lower temperature than at the time when it is about to pass from the larva to the pupa state; and it immediately seeks a retired situation where it may suspend itself vertically at rest, and complete the development of what are now to become its most important organs of locomotion. In doing this the insect first begins to breathe very deeply, and continues to do so for a considerable time. The inspired air passes from the large air-sacs in the abdomen into the base of the wings, and while the ramified air-tubes in the wings are becoming elongated and distended, and the wings in consequence developed, the temperature of the insect again begins to increase. But it is not till the wings have become firm and fitted for flight that the insect is enabled to generate its full amount of heat. Thus, in an observation on a puss-moth, half an hour after coming from the pupa, its temperature was only two-tenths of a degree above that of the atmosphere; an hour afterwards three-tenths; in an hour and a half six-tenths, when the insect was moderately active. In two hours and a half's time, when the insect was a little more active, its temperature was nearly one degree and a quarter above that of the atmosphere; and on the following day, when perfectly strong and excited, as during rapid flight, it was seven degrees above the temperature of the atmosphere.

The hymenopterous insects which live in society, such as bees, have their heat increased artificially by the brooding of the nurse-bees over the cocoon or pupa case; but when the young bee comes forth it parts with its temperature most rapidly, unless immediately protected by warmth from the bodies of other individuals. But when the same insect, a few hours afterwards, has become fully able to perform all the duties of its existence, it sometimes has a temperature of perhaps twenty degrees above that of the surrounding air, while its temperature in the larva state is scarcely more than three degrees higher.

The temperature of insects is influenced by various

conditions, such as *abstinence, inactivity, sleep, hybernation, and inordinate excitement.*

1. *Abstinence.*—When long deprived of food, the insect's power of generating and maintaining its natural heat is diminished. When food is supplied the respiration is restored to its original condition, and they again evolve a full amount of heat. The same remarks apply to the larvæ.

2. During *inactivity* the respiration, and consequently the temperature, is diminished. Many insects which have a comparatively high temperature in a state of active exertion in the early part of summer, have their temperature greatly reduced when they become inactive at the end of autumn; and even during summer, when an insect passes from a state of inactivity into that of natural sleep, its temperature subsides even during summer very nearly to that of the surrounding air.

3. *Sleep.*—All insects enjoy a periodical state of repose or natural sleep. They are endowed with this privilege of life in common with other animals for the renovation of their energies. During sleep, respiration, circulation, digestion, and the evolution of animal heat, are all diminished until a fresh amount of voluntary power is again generated, and the animal is aroused to the enjoyment of it either by its superabundance, or through the agency of external stimuli. It is no small amount of this privilege that is enjoyed by insects. Mr. Newport has witnessed sleeping in almost every order of insects, and is satisfied that they enjoy as great a proportion of rest as any other animals. Many insects will remain in a state of rest during ten, twelve, or twenty hours at a time, even in their seasons of activity. "Every one is aware that the common May chaffer (*Melolontha vulgaris*) will often continue sleeping on the leaves of the lime-tree throughout the whole of a fine summer's day, and not become active until near sunset. The case is the same with nearly the whole tribe of sphynges and moths, while many butterflies, which are active during sunshine, will often remain for two or three days, when the weather is gloomy, affixed to the very same spot. The common honey-bee, notwithstanding the bustle and activity of the hive, enjoys its share of repose as well as other insects even amidst the apparent commotion of its own dwelling. Heber observed that his bees often inserted their heads and part of their bodies into the empty combs, and remained there for a considerable time. They were then quietly sleeping in the cell. At other times they appear to sleep for short intervals on the surface of the combs. I have seen them towards the latter end of summer in the cells in great numbers for many hours together. It is there also where many of them pass a portion of their winter, doubtless in a state of hybernation, or most profound sleep; and it is an interesting fact, that this inactivity of the inhabitants of the hive during winter is accompanied by a diminution of heat in their dwelling."

4. *Hybernation* differs from natural rest in some of its exciting causes. "There are reasons for believing that this disposition to pass into a profound sleep bears some relation to the changes which take place at certain periods in the capacity of the respiratory organs, which seem to become oppressed and their full expansion prevented by the remarkable accumulation of fat which always exists in the bodies of insects, before passing into the true hybernating condition."

It is well known to the cottager, that when the flowers have not yielded an abundance of honey in the latter part of the summer, the bees in his hives will have less chance of existing through the winter than when the produce of honey was plentiful. This latter circumstance may, perhaps, be said to arise from a deficiency in the quantity of honey stored up by the bees; but Mr. Newport has strong reasons for believing that it chiefly arises from the bees being in a worse bodily condition, and having but a small quantity of nutriment stored up within their own system, which alone

enables them to pass some portion of the winter in a state of repose.

5. *Inordinate excitement.*—The temperature of a single insect is only a few degrees above the medium in which it is living, and the actual heat of the insect is increased in proportion to the amount of its respiration. When an insect is at rest, its temperature is comparatively low, and it becomes greatly increased during violent activity. Thus a female bee was enclosed in a stopped phial: during five minutes it was very active, and its temperature rose six and a half degrees above that of the air in the bottle previously examined. In another case, a humble bee was put into a phial, and the insect was greatly excited during six or eight minutes. When it had become quiet, the thermometer was carefully introduced without touching the insect, and the mercury rose nearly six degrees above the temperature of the air in the phial at the commencement of the observation. The insect then became excited, and the thermometer was held near enough to touch the tips of its wings. The temperature immediately sunk two and one-fifth degrees. This result was obtained several times, thus showing the interesting fact, that the vibration of the wings tends to cool the body of the insect during flight, and to moderate its temperature.

From the numerous and varied observations of Mr. Newport, it is clear that a very large proportion of heat evolved by insects in all their states passes off into the surrounding medium, and that the amount of heat evolved is in proportion to the degree of excitement and consequent amount of respiration. And since the temperature of insects is higher than that of the surrounding atmosphere, it is clear that they ought not to be considered as cold-blooded animals.

Respecting the temperature of different tribes of insects, it appears that volant insects, in their perfect state, have the highest temperature, while those species which have the lowest are constantly located on the earth. Among the former, those hymenopterous and lepidopterous species have the highest temperature which pass nearly the whole of their active condition on the wing in the open air, either busily engaged in collecting honey, or flitting wantonly from flower to flower, and breathing the largest amount of atmospheric influence. The hive-bee, and numerous insects allied to it, and the elegant and sportive butterflies, have the highest amount of heat. Next to these are probably their predatory enemies, the hornets and wasps, and others of the same order; and, lastly, a tribe which is generally located on the ground, but sometimes winged—the ants. Next below the diurnal insects are the crepuscular, or those which fly in the twilight, the highest of which are the sphynges and moths.

A SKETCH OF DOMESTIC LIFE.¹

CHAP. I.—THE FATHER'S RETURN.

ONE golden evening in June, 1832, a travelling carriage was rolling along the highroad which led to the pleasant valley of Koran. Within the coach sat, with folded arms, a strong and powerfully-built man of sixty, but fresh-looking as if scarcely fifty years had passed over him. He was simply clad in black, with a hunting cap drawn over his forehead. Danielis was the traveller's name: he was an elder of the church, and was returning from a tour which he usually took every summer, either for health or recreation. The country lay before him, bathed in the purple glow of sunset; meadows, woods, and villages, mingled together in

(1) From the German of Heinrich Schöbke.

undulating luxuriance; but Danielis hardly noticed it. His heart was with the scenes he had just quitted; his thoughts hovered over the bare table-lands of the Saubian Alps, or the ruins of the Abbey Kirtchan; and memory conjured up the pleasant conversations he had held in the shady walks of Rippolstan with dear and intimate friends.

Quickly the images of the past melted into thoughts of the present; and his mind turned to those dearest to him, their interests and welfare. He beheld at a short distance, opposite the town of Koran, his modest but happy dwelling. It was built in the Italian style on the slope of a wooded hill. As the carriage drove on, he saw the gigantic willow, planted beside a little stream which bounded his garden; its wide branches stretched over to the opposite meadow, and the pendant stems waved in the evening breeze. Then the poplars by the fountain, and the dove-cot,—his children's delight,—rose before the father's eyes.

He stood up in the carriage, with emotions more of anxiety than pleasure. His eyes wandered right and left, as if asking every passer-by, "Is all well in that house?" Though far from being superstitious, Danielis sometimes allowed his imagination to play him tricks, for which his reason reproached him. He tried to divine from the countenances of the casual passengers who recognised him the welfare of those beloved ones whom he had left behind.

The Elder might well dread any interruption to his felicity. His family, numerous as it was, formed one of those happy households so seldom seen. Riches were not the cause of their happiness; for, possessing but a moderate fortune, they lived as economically as a mechanic or husbandman's family, and yet had more at their command than many a nobleman. The simplicity, piety, and high principle which Danielis had inculcated in each member of his family, his own fatherly kindness, and the tender love of his wife, the best of mothers, combined to render all the household truly happy.

"Most men," said Danielis once, in a letter to a friend, a portion of which we quote to display the character of a man whom his neighbours considered as rather eccentric,—*"most men lead an unreal life because they live only for appearances. In the world there is an equal portion of joy and sorrow; and I would as little part with the one as with the other. Both contribute to beautify existence; both incite us to improvement. Our happiness or misery depends not on chance; for the unseen hand of God, which men call fate, brings neither bliss nor woe but to work out a good end towards us. Riches, power, and honour, are often blessings only in appearance; yet how great sacrifices will men make to obtain them! He who, having been prosperous, is satisfied with an easy competence, and devotes the rest to do good to others; and he who, poor himself, is yet a helping angel to those poorer still; these two depend not on the smile or frown of Fortune. Happiness and peace are theirs. The world obtains no evil influence over them, they are righteous instruments in the hand of God."*

But now let us return to him who thus wrote. The coach stopped at the entrance-gate which led by a side path to the home of Danielis. Joyous sounds from well-known voices arose throughout the garden. A merry troop rushed to meet the father; first the elder children, and after them the merry little ones. Scarcely had he embraced them all, when his loving wife Anna threw herself into his arms, and he fondly kissed her clear open brow, on which forty-five years had not imprinted a single wrinkle. Near her stood Joseph, the eldest son, with his young wife, whom he had lately married. Then came Else, the favourite of the family, a village girl who had been taken into the household. She carried in her arms her young charge, the little Christian, of four years old, who was struggling to reach his father. The happy parent entered his home in the

midst of a body-guard more faithful, loving, and devoted, than ever surrounded a king.

CHAP. II.—IMPORTANT COMMUNICATIONS.

In a few days, the first excitement of joy being over, every thing in the house of the Elder returned to its usual routine, which was so simple, and free alike from display and annoyance, that no habitation within many miles could vie with it. This quiet uniformity was one source of happiness; the history of a day was the history of a year. Before the dwellers in the neighbourhood had shaken off their slumbers, every one in the house of Danielis was up and busy; the father among his books and papers in an upper chamber, or instructing his elder children; the mother in the lower part of the house, superintending her domestics, or teaching the younger branches of the family.

After the morning, which was spent in a cloister-like silence, all assembled round the table to a very simple meal. From that moment merry laughter, noise, and jesting, were heard throughout the house, and resounded in the garden, the meadow, and even to the neighbouring heights, while the parents in summer-time sat in the garden conversing with friends and relatives. At evening time, the children raised their voices in united song, which rung through the stillness of the country all around, and was repeated by the woodland echoes. This uniform life was seldom broken.

One morning as Danielis was seated at the writing-table of the study, Mother Anna entered the room with serious looks. Before she uttered a word, the expression of her face announced to her husband that she had something important to disclose.

"What is the matter, my dear wife?" asked he, laying down his pen.

"You see it now," she said, in a tone that foreboded ill; "you see it now, I was quite right."

"When were you ever wrong?" replied the husband, smiling. "But in what particular thing are you right now?"

"In what I have feared so long, and what you would not believe. Our Jacob and Else have fallen in love with each other, and, I doubt not, are secretly betrothed, or will be soon."

"Secretly betrothed!" repeated Danielis, much astonished; and, though yet doubting the fact, unable to conceal the uneasiness it caused him.

To explain this affair, our readers should be acquainted that "our Jacob" was one of the eldest sons of this worthy couple; he was a young man of twenty, and a curate in the town of Zollingen.

"How and from whom have you learnt this?" asked Danielis, after a momentary silence.

"By mere chance. I went into Else's apartment, and found on the ground an open letter in Jacob's handwriting. Fancying it was one of his, which I had dropped by accident, I took it up and read the contents. It was full of exhortations to piety and obedience to us; and then came a confession of the most tender love for Else herself."

As his wife spoke, the countenance of the Elder softened; because perhaps he had gained much self-command in the course of a life of trial, or perhaps from the confidence he had in his son's pure and manly character. "And Else?" asked he.

"She came into the room, and saw the letter in my hand with apparent indifference. When I advised her in future to be more careful of his papers, and not to leave them about, she coloured deeply, and looked anxious. But when I inquired into the particulars, she confessed all with innocent frankness, though with much timidity; and it was easy to perceive that she saw nothing wrong in the affair. 'Jacob had always been so kind to her—she owed him so much;—it was no wonder that every one loved Jacob, for he deserved

it.' I really doubt whether the girl is even aware of the nature of his affection for her."

A smile passed over the Elder's face. "And Mother Anna—what did she say to all this?"

"I did not reproach her, I could not;—and besides it would only have blown an insignificant spark into a flame. I advised her not to say a word about this circumstance, as it might do her harm. Else knows nothing of the world; she is as inexperienced as it is possible for a girl of sixteen to be; and the more a young maiden is talked about, the more is her fair fame sullied. I told her not to answer Jacob's letter, and promised to reply to it myself."

"Wisely said and wisely done," exclaimed Daniels. "By this means, you keep Else's secret, and we gain time for the future. A word of motherly warning does much. Let there be no secrets between us and our children. I can easily forgive the impetuous boy. Else is lovely and good, enough to set on fire a heart and imagination like our Jacob's."

"Yes, she is certainly pretty," answered the mother; "rather too delicate looking, but modest and humble; and she has made the most of the little education she has received. Let us watch both the young people. Jacob cannot and must not think of marriage yet. It will be some time before he obtains a living, and love affairs like this are soon forgotten."

"Hum! not always, dear child," added Daniels, with a cheerful, meaning smile. "Think of ourselves! Each of my children, like myself, shall be at liberty to make his own choice as soon as he is capable of so doing. In such matters, parents should neither command nor forbid."

"You are quite right, my dear husband; but it is their duty to advise. 'Love,' says the proverb, 'blinds'—"

"True," interrupted the Elder; and pressing his wife's hand, with an affectionate smile, he added, "but you cannot deny that in my case love made me see the clearer. And Else, though inferior in birth, seems one of those rare beings who can not only confer true happiness on a good husband, but even improve a bad one,—praise which I would not bestow on many of our high-born belles."

"I quite agree with you; and I would receive Else as my daughter without any scruple as to her person or mind. But appearances—gossip; think, my dear husband—on one side a clergyman, son of an elder of the church, on the other a village girl!"

Daniels interrupted her, somewhat irritated in his manner, "What! shall we adopt the folly of Cousin Maultasch as our rule of life? Never! Whether princess or beggar, a woman bears no rank in society but what she borrows from her husband. In the eyes of men, peeresses and peasants are alike, while equal in virtue and beauty. They see the woman only, whether clothed in silk or in homespun cotton. This is the sempstress's creation, not God's. Woman is worthy of love for herself; for her loveliness, the gift of nature; for her talent, acquired by education; for her virtuous qualities; rank and wealth are not essential to her. Therefore it is no marvel that a peasant girl became empress of Russia, nor that a queen left the throne for the arms of a soldier. Now, my dear wife, let us drop the subject; only let us watch the conduct of Jacob and Else."

CHAP. III.—THE MOTHER'S LETTER.

AFTER this conversation it was in vain for the Elder to try to resume his occupation when his wife had left the apartment. An event like the preceding is one of deep moment to one to whom domestic ties are dear and holy. Daniels paced the study, gazing abstractedly on the "regiment of his dead," as he was wont to entitle the books arranged along the walls, in different bindings, according to the subjects on which they treated. Then the Elder fixed his eyes on the portraits of friends whom death had taken from him—treasures which he

loved to have above his desk, in his daily sight. But vain were all his attempts to divert his mind from the one engrossing topic. What he had said to his wife was what he really felt. But he had not expressed all his mind, which, if spoken, would have been this:—

"The boy is wrong to think of a wife before he is able to support her. He is wrong, if he seeks to gratify his feelings, and by stealing her affections to destroy the peace of a poor and innocent maiden. He is wrong to be wanting in confidence to his parents. This last, however, I can excuse, for there are two things which are usually closely concealed, and which shun all witnesses but God;—first love and heartfelt religion. No, I will not blame the young man. Did I not do the same in my own youth!"

While these thoughts passed through the Elder's mind, Mother Anna wrote her opinion to her son in the following manner:—

"Chance, my dear Jacob," wrote she, "has thrown into my hands a letter to Else from you. Its contents have not surprised me; but I am grieved that you should have placed yourself and this excellent girl in a painful situation. I spoke immediately to Else; and even if I had not loved her before, she would have gained my affection by her rational, modest, and simple minded conduct on this occasion. The result of our conversation proves to me that she does not fully understand your letter, and is not aware of the seriousness of your intentions. She has allowed me to answer you, for in her simplicity she knows not whether she prefers you to another, and therefore does not write to you herself, but deposes me to do so. The best answer I can give is to repeat, word for word, our conversation."

"Else," said I, "I know Jacob well. He is good—excellent; but so full of impulse that he is frequently led away by his feelings, and a reaction then quickly takes place. I love you too well to suffer you to become the sacrifice of his impetuosity. But I shall not require you to refuse his hand should his affection stand the test of time; especially if you feel for him that love which is necessary to resign yourself and your fate unto a husband, to bear calmly all the changes and trials of life, and to find your own happiness in that of your husband and in his love. Should time enable Jacob to provide for a wife, and he then should ask your hand, you shall be welcomed as a much-loved daughter. That time may be very near or very distant. Jacob was certainly in the wrong to write you this letter, and I think you are wise in not answering it. Behave as though he had not written; continue good, modest, and industrious; I will instruct you in every domestic occupation, and you must cultivate your mind, so as to accommodate yourself to every situation in life."

"Thus, dear Jacob, did I speak to Else. Your father agrees with me in all, and we expect from your filial affection that your conduct towards this young girl will be extremely prudent, though kind. If you wish to become worthy of respect, respect yourself; and to this end, keep a guard over your own heart. Farewell. With most heart-felt love, "YOUR MOTHER."

(To be continued.)

ON THE THEORY OF LIGHT.

FROM the most primitive days of speculative philosophy, the origin and composition of light has been involved in doubtful obscurity, and has given rise in all ages to a vast deal of theoretical controversy and discussion.

The views of the earliest philosophers were so extremely limited, that they could scarcely be said to have entertained any correct ideas upon the subject; their knowledge being restricted to the laws which

govern the phenomena of light when propagated through a vacuum, or uniform uncrystallized medium, with a very slight insight into the laws of reflection. In elucidation of the sensation of sight, they reasoned, that, as in our knowledge of all tangible bodies we arrive at a true perception of their form and qualities by the sense of touch, so it must be with respect to sight; for, assuming that no two distant bodies could communicate without a connecting medium, they directly concluded that rays, or emanations, must be constantly emitted from the eye, and, by their impulse upon distant bodies, cause our perceptions of their colour and form; which proved to be a singularly unfortunate idea, not only on account of the formation of the optic axis, but likewise because it gave no reason why objects should not be equally discernible in the dark.

Although glimpses of more advanced ideas were given forth by Descartes and Hooke in the earliest part of the seventeenth century, it was not until the mighty genius of Newton arose, that anything approaching a comprehensive theory was adduced; but even his hypothesis upon this subject was not marked by that simple majesty of plan, otherwise so highly characteristic of his discoveries; for in the place of comprehensiveness and mathematical arrangement he substituted mere elegance of style. He supposed, that all luminous bodies gave forth particles of an inconceivable minuteness, which, darting along with extreme velocity, fell upon the eye, and were thence depicted upon the retina, thus producing a perception on the system of nerves; that each particle of matter had its pole of attraction and repulsion, and, turning on its centre as it advanced on its course, alternately presented its positive or negative pole; so that, arriving at the surface of a body, it was either repelled (*i. e.* reflected) or attracted, so as to enter the surface, according to the pole in advance.

This, although generally termed the Newtonian Theory, was never positively advanced by him, but was so carefully given forth in such general terms, that, let the real principles be what they may, they will, when discovered, be sure to have many coincident ideas in the theory of Newton; thus showing, that, if we really possess any new or peculiar views on a subject to which we wish to lay an undisputable claim, we should be especially careful in the perspicuity of our language and in the avoidance of all ambiguity of expression.

Contemporaneous with this philosopher was Huyghens, a most rigid mathematician, and one who, by his originality of conception, will always retain a distinguished place in the annals of science. He immediately saw the fallacies of Newton, and in the place of particles of matter, substituted undulatory vibrations of an elastic ether, universally diffused through nature; to illustrate which, nothing can be more fitting than the following extract from one of the elegant memoirs of Sir W. Hamilton:—

"This is the theory of Huyghens, who compared the gradual propagation of light, not to the motion of a projectile, but to the spreading of sound through air, or of waves through water. It was, according to him, no *thing* in the ordinary sense, no *body* which moved from the sun to the earth, or from a visible object to the eye; but a state, a motion, a disturbance, which was first in one place, and then in another, as, when we hear a cannon which has been fired at a distance, no bullet, no particle, even of air, makes its way from the cannon to the ear, but only the aerial motion spreads; the air near the cannon is disturbed first, then that which is a little farther, and, last of all, the air that touches us. Or, like the waves that spread and grow upon some peaceful lake, when a pebble has stirred its surface: the floating waterlilies rise and fall, but scarcely quit their place, while the enlarging wave passes on, and moves them in succession. So that great ocean of ether, which bathes the farthest stars, is ever newly stirred by the waves that spread and grow

from every source of light, till they move and agitate the whole with their minute vibrations; yet, like sounds through air, or waves on water, these multitudinous disturbances make no confusion, but freely mix and cross, while each retains its identity, and keeps the impress of its proper origin."

This, then, is a fundamental view of a theory which has shown itself peculiarly felicitous in its adaptation to the various phenomena of light, and which won from Herschell the observation, that, "if not true, it fully deserved to be so." Still the supposition that light is but a continuous series of ethereal vibrations will scarcely accord with our conceptions of its influence on chemical combinations, or with the manner of its affecting both animal and vegetable life. Up to the present day, the subject has continued to receive the strictest attention and research from men of the highest talent and industry; the whole of Huyghens' theory has been carefully analysed and considered by Young, Fresnel, and Cauchy, who have, in fact, remodelled many of its primary elements, thus causing it to bear upon many important points where it was previously highly defective.

Having thus briefly reviewed the abstract theory of light, from the earliest period to the present time, we conclude with the full impression on our mind, that the real secret has still eluded our search, and that it will be found at a fitting time; possibly as a subtle fluid, pervading all space and matter, bearing a strong similarity in its laws and action to the mysterious electric fluid.

EXTRACTS FROM NEW BOOKS.

THE PEASANT-LIFE OF GREECE.

"Here poverty seems actually unknown. Not that the simple Greek peasant is rich, unless it be that negative richness which they may be said to find in their security from all material wants, produced by the benign climate and the abundant nature. In the summer they greatly prefer, as I have said, their couch in the open air to the most sumptuous dwelling which their fancy could picture. They gather beneath the olive-trees, which shed their ready fruits upon their very head, the greater part of their simple food. The light clothing they require is an hereditary possession descending from father to son; and thus having food and raiment, they are therewith abundantly content. The result of this is, that I believe there is no country in the world where beggary is so little known. Systematic begging does actually not exist, excepting in the case of one blind old mendicant, certainly the richest man of my acquaintance, who sits all day in the portico of the Temple of Theseus at Athens, and majestically receives the alms which every one hastens to bestow on him—too happy to find a legitimate object on whom to exercise the duty of charity, so strictly enjoined by their church."—*Wayfaring Sketches among the Greeks and the Turks. By a Seven Years' Resident in Greece.*

TIGER SHOOTING.

"THE ravine was extensive, and there was a good deal of cleared ground in it, so that we could see up and down it a good way. We were in the act of descending half way down the bank when we heard frequent loud yelps approaching us fast. Jack now told me to drop down, keep close, and the gun ready; he did the same, his dark expressive eyes dancing with half-concealed eagerness. We had not long to wait, for in two or three minutes a beautiful young wild black horse came tearing along the clear part of the ravine, in the direction of our concealment; he was going at his utmost speed, and closely pursued by two splendid tigers that ran much quicker, and whose bounds we could distinctly

perceive were great, as at each they rose several feet from the ground.

"As the poor horse came up nearly to where we now were (for we crawled deeper into the ravine) he seemed to be nearly exhausted, and slipped down on his knees, about thirty yards from where we knelt down ready for them. One of the tigers crouched with all the twisting motion of a huge cat, and made a spring of about twenty feet right on the back of the horse, and seized him by the neck with a fearful growl; the other animal trotted round the horse, lashing his tail about, and roaring with terrific ferocity; they were too busy now with their victim to scent us out. 'Are you ready now?' said Jack. 'I am,' said I. By agreement I covered the tiger on the horse, my guide the other; at a signal both guns went off together.

"The one I had covered rolled kicking off the horse, the other fell down and tumbled about in all directions, evidently badly wounded. 'Now for the knife,' said Jack; and we rushed up to where they lay. Mine was dead, but the other was still active, though unable to move any distance. I went up to him with the intention of firing my second barrel through his head, when my guide insisted upon me letting him alone, and drew his long knife. The tiger had yet great vitality, and I was much alarmed lest he might yet injure the man, and kept the gun ready for an immediate shot.

"Jack went boldly up to him; the infuriated animal grinned horribly and writhed rapidly about, throwing up a good deal of dust from the dry ground. One plunge of the knife, a roar, into him again, a hideous grin and a tumble about, some blood scattered on the ground, at him again, a miss stroke of the knife, try once more, both down, and nearly covered with dust. I was now determined to put an end to this dangerous conflict, if I could; but the rapid motion of both man and beast prevented me firing, lest one should receive what was intended for the other.

"The tiger had now hold of either the Indian or his clothes, as both rolled together; yet the knife was busily at work. At last his arm was raised high up with the red dripping instrument, and, after one more angry plunge of it, the tiger turned on his back, his paws and whole frame quivering, and, with an attempt at a ghastly grin, he fell over on his side and died. Jack then stood up, covered with the blood of the animal, and his first ejaculation was, 'Un diablo,' in English, 'One devil.' I was anxious to ascertain if the man was hurt, and, after washing himself in a pool of water near us, I was delighted to see that he escaped, with the exception of one faint bite on the shoulder, and a few tears of the paws on his arms, which he seemed to care nothing about. He was a brave man, told me he killed many of them, but this one he said died hard."—*Adventures on the Western Coast of South America.* By JOHN COLTER, M.D.

A GREEK BURIAL.

"When a soul departs, their lamentations are terrible, but they sorrow for the survivors only;—as for the dead, they count him in all things a conqueror; so they place the laurel garland on his brow, and in his hand the palm of victory! They uncover the face, that all may see what a majesty of most serene repose is stamped thereon, and they sing a hymn of thanksgiving as they bear him away to his rest. I remember when they buried that bright-eyed Greek maiden, snatched suddenly from earth, when her young heart was light as her face was fair, they arrayed her, so rigid and motionless, in the gay dress she had never worn but for some great fête or gala, as though this more than any were a day of rejoicing for her; and thus attired, with her long hair spread out over her still bosom, all decked with flowers, they laid her uncoffined in her grave. At her feet they placed a small flask of

wine and a basket of corn, in accordance with an ancient Greek superstition, which supposes that for three days and nights the disembodied spirit lingers mournfully round its tenement of clay, the garment of its mortality, wherein, as a pilgrim and a stranger on the earth, it lived and loved, it sinned and suffered! As soon as the first symptom of decay announces that the curse of corruption is at work, they believe that the purer essence departs to purer realms. Before the grave was closed, whilst for the last time the warm radiance of the sunset cast a glow like the mockery of life over the marble face of the poor young girl, her friends, as a last precaution, took measures to ascertain that she was actually dead, and not in a swoon. The means they always take in such instances to ascertain a fact, which elsewhere would be ensured by a doctor's certificate, is touching in the extreme: the person, whom, whilst alive, it was known the deceased loved best, the mother, or it may be the young betrothed, who had hoped to place on her head the gay bridal crown instead of the green laurel garland of death, advances and calls her by her name, repeating after it the word *ella* (come) several times, in a tone of the most passionate entreaty; if she is mute to this appeal, if she is deaf to the voice that was dearest to her on earth, then they no longer doubt that she is dead indeed; they cover up the grave, lift their eyes to the heaven where they believe her to be, for the Greeks do not hold the doctrine of purgatory, and, having made the sign of the cross, they depart in silence to their homes."—*Wayfaring Sketches among the Greeks and Turks.* By a Seven Years' Resident in Greece.

THE EXILES.

BY A. H. J.

A SOUND arose from the golden sea,
From its breast of glittering flame—
The voice of melody, deep and free,
From a stately vessel came;
And the waters whispered in glittering play
With the joyous sound as it died away.

The wanderers from a distant land
Exultingly saw their own;
They marked the gleam of its shining strand,
Where the sunlight broadly shone,
And the shadowy hills stretching far away,
Where the golden glory of evening lay.

They sang how the land they loved so well,
Through many a burning scene,
Would softly circle them, like a spell,
Even with a golden green;
Would show them beneath the still waters clearly
The soft green fields they had loved so dearly—

The soft green fields where they used to lie,
And gaze on the distant sea,
And bury within them the idle sigh
When they thought of what must be.
But the trial is past, and the triumph is come—
One shout! it shall reach to the hearts at home.

The song has ceased; and that happy band
Lie tranced in dreaming sleep,
Wandering still on their own sweet land,
Feeling its loveliness creep
Into their slumbering senses, and stealing
Like music to all their sources of feeling.

Yet still, with that mysterious power
Vaguely felt in a dream,
Of mingling grief with the brightest hour,
Beloved voices would seem—
The dear voices of all they had loved so well—
Would seem but to whisper one word—farewell.

And thus they slumbered—when suddenly
Came a low, a meaning voice,
So undefined, it might almost be
The wail of a human voice;
Till nearer and nearer, with mournful swell,
It smote on the ear like a passing bell,

Calling the waters with sullen breath,
Breaking their placid sleep—
For the hour was come, there must be death;
And from caverns dark and deep,
From desolate chambers, with solemn cry,
Came the sea in its wrath—for all must die.

With a demon's strength, with a thunder shout,
Up gathered the tempest fell,
The voice of the mighty deep rang out
The sufferers' earthly knell;
While still within sight lay the silent shore,—
The land which might echo their tread no more.

No more! no more!—the deep sounding sea,
With its waves of curdling foam,
Their only abiding place must be,
Their vast unfathomed home:
Far above them the hungry waters fall,
The waters black for a funeral pall.

Yet happier far in early sleep,
Like those young hearts, to lie,
Ere the lustrous eye had learned to weep;
They knew but one agony;
They never knew nought of the bitter strife
We must struggle through in this mortal life.

Of pining care—of heart-wasting sin—
They knew not the burden sore;
No grief had darkened their world within,
Even to its inmost core;
They passed from the troubled waves to the sky,
From the troubled waves to eternity.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

DISPUTE OF THE BEDOUINS FOR THE CONVEYANCE OF TRAVELLERS.

At last there was an impetuous rush from the noisiest of the circles towards the spot where we stood, and a party of the new comers attempted to take the camels on which we rode. We resisted for a while amid a torrent of expletives on all sides; the din was terrific, every one speaking at once, and excited to a pitch of frenzy that seemed ungovernable. All the Oulad Said's camels were unloaded, our baggage was taken up and scattered piecemeal over the camp, one fellow carrying a box, another a bed, a third a hamper, to their respective camels. The Oulad Said had yielded to the pressure of circumstances, and we were to submit.

Meantime another attack was made on the dromedaries we rode, the new comers insisting on having the whole cargo, ourselves being as good loads in their opinion as anything else. Poor Mr. Fiske, in a struggle, was thrown from his dromedary, and had a very narrow escape, while the Bedouins were trying to make the beast kneel down in order to change his burden; so matters grew worse and worse. At last, when the scramble was finished, and our baggage heaped on fresh

camels, there being scarcely a rope or a thong to hold the packages among the spoilers, Hussein came and begged us to go on.

We moved forward, accordingly, at a slow pace, surrounded by the mixed multitude—some who had come with us, and others who had joined us at the commencement of the affray. We were still mounted on our own camels, and so were Hussein and Toulleb, but those of the servants had been changed in the first attack. We had not proceeded far before some shots were fired by the Bedouins on the hill before us; not, I believe, with intent to kill, but to produce an effect which certainly was immediate, for the Oulad Said camels, our late conveyance, who had been following the new comers at a small distance, moved off to the left of the road. Hussein joined them; there was another movement, and then an Arab seized the bridle of my dromedary, and brought him upon his knees; our friends, also, were at once dismounted. I must do the aggressors the justice to say that they used no violence, and it appeared as though they were excited to act as they had done from eagerness to have their camels loaded.

In this last rush, while I was in the middle of the Arabs, calling to Hussein to come and recover my dromedary, one of the Bedouins put a belt and powder-horn round my neck. When Hussein returned with my dromedary, after a long discussion, in which I saw for the first time that both he and Toulleb had lost their presence of mind, I followed slowly the wild group that preceded us. So we rode on after this savage-looking escort, with high words and loud disputing. Afterwards came our baggage, hastily and roughly huddled together on the new camels, followed by a host of Bedouins, some without arms, others with long sticks only, the rest with knives and guns; every now and then, as they passed, scowling at us in a manner by no means prepossessing. However, we did not much care, except for our provisions and trunks, which had a very good chance of being carried across the desert, safe from either Pasha or Sultan.—*Lord Castlereagh's Journey to Damascus*.

Few men have done more harm than those who have been thought to be able to do least; and there cannot be a greater error than to believe a man whom we see qualified with too mean parts to do good, to be, therefore, incapable of doing hurt. There is a supply of malice, of pride, of industry, and even of folly, in the meekest, when he sets his heart upon it, that makes a strange progress in wickedness.—*Clarendon*.

It is a secret known to few; yet of no small use in the conduct of life, that when you fall into a man's conversation, the first thing you should consider is, whether he has a greater inclination to hear you, or that you should hear him.—*Addison*.

Remains of Malmesbury Abbey Church.¹

Few, if any, of the monuments or records of the ingenuity of man are so suggestive of reflection and meditation as the architectural piles that have been consecrated, at various periods, to the service of Religion. Of these, "none appears more calculated to inspire the mind with awe and veneration than that peculiar style employed in ecclesiastical edifices during the middle ages, originally invented by the Normans, and carried by their successors to the highest point of perfection. It is true that the classic orders of Greece and Rome have never been surpassed as presenting models of grandeur and beauty in the construction of palaces and public buildings of a merely secular character; but, where is the temple raised by pagan hands, and dedicated to imaginary deities, that can compare with the sacred interior of the christian cathedral of our forefathers, glorious with its many clustered columns and vaulted roofs, long-drawn aisles, and richly storied windows,—fabrics conceived in the loftiest spirit of devotion, and consecrated to the living God!"

In these memorials of the piety and taste of our forefathers, who, in their erection, glorified Religion through Art, England is especially rich; but, probably,

in no part of the island is there a greater store of this archæological wealth than in the county of Wilts, on the north-western extremity of which lies the borough of Malmesbury, rendered famous and flourishing by its abbey, the most considerable monastic institution in the west of England, except that of Hintonbury. The abbey at Malmesbury originated with Maldulf, a Scotch monk, who settled here about A.D. 643, and, gathering together a company, first of scholars, and then of persons disposed to live in regular discipline, began a monastery. It was better established by Aldhelm, who had been educated here under Maldulf; and who, after his master's death, was appointed, A.D. 675, to be abbot, by Eleutherius, Bishop of Winchester. Aldhelm was a native of Malmesbury, and, considering the time in which he lived, was "an eminent scholar, a good writer, a poet of no mean merit, and an excellent musician." He was nephew to Ina, King of Wessex, and from the abbacy of Malmesbury was advanced to the see of Sherburne, and finally canonized. The fame and influence of such a man must have greatly promoted the prosperity of the monastery of Benedictines at Malmesbury; and Eleutherius, on his account, gave the town, &c., to the new foundation.

Thus acquiring celebrity at an early period, the abbey continued to increase in riches and influence

(1) Essay on the Ecclesiastical Architecture of England. By Thomas Poreh, Esq., A.M., appended to "Some Account of the Church of St. Mary Magdalene, Taunton. 1835."

thenceforth to the period of its dissolution. Many kings and nobles contributed largely to its revenues: among these were the Saxon sovereigns Ina, Athelstan, Edgar, and Edward the Confessor; also, William the Conqueror and his queen Matilda. There is reason to believe the Saxon monarchs to have been, in those dark ages, the passive agents of the monks, by whom they were influenced or intimidated to make and confirm various decrees, grants, deeds, &c., in their favour. In some of these, promises of eternal salvation are held forth to those who would aid and support the monasteries, and everlasting torment denounced against anyone who had the temerity to oppose them. Edward the Confessor, for reverence of St. Aldhelm, whose glorious body in Malmesbury Abbey Church "venerably reposeth, and shines with many miracles," granted, in 1065, a charter of exemption from secular affairs, and confirmation of privileges, concluding thus:—"Whoever, therefore, assists this our donation or liberty, may it lead him to the enjoyment of paradise; but whoever contemns it, may he, with hands and feet bound, be plunged into the depths of hell." In this charter, to be seen in the register book of the abbey, there is an enumeration of all the lands and possessions belonging to it at that time, from which it appears to have been immensely rich; the manors are said to have consisted of 350 hides of land, nearly equal to 40,000 acres.

The charter of William the Conqueror to this monastery also contains heavy anathemas and curses against all persons who should infringe upon or diminish its benefactions, and a blessing to such as should increase or improve the revenues.—*Dugdale's Monasticon*.

The history of the foundation, as related by Mr. Britton in his "Architectural Antiquities," is very interesting. From this valuable work we gather that "the great Athelstan made Aldhelm his tutelary saint; and, for his sake, granted vast immunities to the town, and enriched the monastery with ample gifts. Among these, and which tended most essentially to attract and awe the superstitious of the age, was a part of what was said to be the real cross of Christ and a portion of his crown of thorns, which Athelstan had received as presents, with other similar relics, from Hugh, King of France, and which he gave to this abbey.

"Athelstan also commanded that he should be interred within its walls; and, dying at Gloucester, in 941, his remains were brought to this place, and deposited with great pomp under the high altar.

"In the reign of Edgar, (about A.D. 974,) we find some slight account of the monastic buildings of the time, by which it appears that no part of the present structure could have existed at that period. In a deed relating to Malmesbury Abbey, he declares his resolution to restore the sacred monasteries, which being composed of rotten shingles and worm-eaten boards, divine service was neglected in them, and they were almost deserted! He, therefore, had issued gifts from his treasury, for the repairing of the ruined edifices, and had appointed Alfric, a man eminently skilled and practised in ecclesiastical matters, to preside over the famous Abbey of Malmesbury," &c.

It must not, however, be concluded from the above, that the Saxon monasteries were built entirely of timber; the Rev. D. Ingram, Saxon professor at Oxford, on the contrary, is of opinion that nothing but the roof was composed of timber.

This is the only royal grant or deed extant that alludes to the building, which must, therefore, have been originally of bad construction. Hence, we may safely conclude, that the church, of which the present remains form a part, was not built till after this period: indeed, its architecture is clearly of a later date, as we shall presently see.

"Whether Malmesbury was ever an episcopal seat or not, may admit of a doubt, as Odo, Bishop of Wiltshire, is styled by some writers *Episcopus Malmesburie*. It is pretty certain that, in the reign of Edward

the Confessor, Herman, Bishop of Wiltshire, obtained the royal consent to establish the episcopal seat here, which, at that time, is said to have been at Ramsbury, in this county. The monks, however, opposed this; and, by the influence of Earl Godwin, succeeded in preventing the bishop from effecting his scheme. Bishop Roger, who acquired great power in the kingdom during the reign of Henry I., was very active in this county, and, according to the concurring testimony of many historians, he built castles, or greatly augmented the fortifications at Malmesbury and other places. During his prelacy and power, he deposed Abbot Edulf, who had governed the convent of Malmesbury for twelve years, and usurped his place. He was made by his patron, Henry I., chancellor, and chief justiciary of England, Bishop of Salisbury; and, during the absence of the monarch in Normandy, he was entrusted with the government of the kingdom. Invested with this extraordinary power, being naturally very ambitious, and possessing great wealth, it is extremely probable that he aimed at celebrity by the erection of some large edifice." To him, therefore, or the period in which he lived, Mr. Britton is inclined to look for the origin of the Abbey Church at Malmesbury.

This opinion is opposed to Sir Richard C. Hoare's pamphlet on the "Topography of Wiltshire," (1818), wherein Malmesbury Abbey is referred to as "a specimen of rich Saxon architecture;" but Sir Richard follows the example of John Carter, who represents part of the remains of the west front (the circular entrance arch, &c.) as "founded in 875," upon which Mr. Britton observes, "It is a common practice to refer the oldest parts of monastic buildings to the period of the original foundation: but this practice is of a dangerous tendency, as calculated to deceive the judgment."¹

This conclusion almost receives confirmation from the following passage in the *De Gestis Regum of William of Malmesbury*: "He (Bishop Roger) was a prelate of great mind, and spared no expense towards completing his designs, especially in buildings; which may be seen in other places, but more particularly at Salisbury and at Malmesbury; for there he erected extensive edifices, at vast cost and with surpassing beauty; the courses of stone being so correctly laid that the joint deceives the eye, and leads it to imagine that the whole is composed of a single block. He built anew the church of Salisbury, and beautified it in such a manner that it yields to none in England, but surpasses many: so that he had just cause to say, 'Lord, I have loved the glory of Thy house.'"

Leland, who visited Malmesbury Abbey in the time of Henry VIII., calls it "a right magnificent thing; where were two steeples, one that had a mightie high pyramis, and felle daungerously, in hominum memoria, and sins was not re-edified; it stood in the middle of the Transeptum of the church, and was a marke to all the countre about," &c.

To show the importance of the foundation, we may here mention that the Abbot of Malmesbury was made one of the twenty-five parliamentary abbots by King Edward III., and had episcopal ornaments and authority granted him by Richard II. The abbots of the monastery, from Maidulf to the dissolution, were, in number forty-six; at which time, according to Dugdale, it was valued at 803*l.* 7*s.* 7*d.* per annum. Richard Frampton, who resigned it to King Henry VIII., had an annuity of 200*l.* assigned him for life.

For what remains of the Abbey Church we are indebted to Thomas Stump, a rich clothier of Malmesbury, who bought it soon after the Dissolution, and gave

(1) Sir R. C. Hoare adds to a catalogue, "The fine Saxon abbey at Malmesbury most powerfully excited both my admiration and attention from the very moment I first viewed it. I, therefore, prevailed upon Mr. John Carter to devote a summer to the minute investigation of this fine relic." Sir R. C. Hoare appears to have been perfectly satisfied with the result of the inquiries which he had instituted.—*An Essay on Topographical Literature*. By John Britton, F.S.A. Printed for the Wiltshire Topographical Society.

it to the town. They fitted up the nave, and used it as their parish church; suffering their former parochial church, except the tower and steeple, that stood in the Abbey churchyard, to go to decay.

The remains of the Abbey Church are seated on the brow of a hill, which slopes rapidly to the north, and to the south-west, where two rivulets wind through narrow valleys, and nearly encompass the town. When entire, the Abbey, with all its offices, must have appeared, from every approach, strikingly magnificent as a work of art; and, though the remains are in a lamentable state of dilapidation, enough is left to demonstrate that eminent architectural science and masonic skill must have been requisite to raise so noble a pile.

As an early specimen of large proportion, massive masonry, and elaborate decoration, Malmesbury had few rivals. It appears to have been crected about that period when the circular and pointed arches were both in use; but when the latter was first beginning to be adopted, and the former was declining. The prevailing style in arches and columns is the massive Anglo-Norman, with the introduction of the Pointed or Early English. A series of the latter is used on both sides of the nave, and in the vaulting of the two aisles. "These," says Mr. Britton, "are evidently part of the original design, and were built at the same time as those portions wherein the circular style prevails." The character of the mouldings and ornaments is late Norman; so that the structure would appear to belong to the Semi-Norman or Transition style, "remarkable for the profusion and beauty of its sculptured details, the combination of round and intersecting arches, and the close approach it presents in many points to the succeeding style," as may be seen in the "Norman triforium with semicircular arches, supported by pointed arches, which are enriched with Norman mouldings, and spring from massive cylindrical Norman piers."—*Blocom's Principles of Gothic Ecclesiastical Architecture*, 8th edit.

We now proceed to the prominent architectural features of the remains, which are the nave with its aisles, parts of the transept, and a large porch on the southern side. In this fragment of a large pile (says Mr. Britton) are displayed three or four different styles, all of which appear to have gradually advanced in lightness of form and elegance of character. The perfect semicircular arch, as the earliest example, is conspicuous in the western front, the southern porch, the original lower tier of windows round the aisles, and in the middle division of the nave. Some of these are plain and simple in their shape and mouldings; others are ornamented with sculptured bassi-relievi; and some have a central mullion, with tracery, &c., the latter, perhaps, the earliest example of the kind. The next variety of feature is the intersecting arch, which formed a sort of ornamental facing round the lower part of the exterior wall of the church. This member of ancient buildings appears to have been used only as a decoration; yet, its column and architrave mouldings, with base, capital, &c., are generally designed with strict regard to symmetry and system. As each arch passed directly over the next column, and intersected its proper architrave, it there formed the most perfect pointed arch. On each side of the nave is a series of pointed arches, which spring from massive columns, and are finished with mouldings and dressings which more properly assimilate with the circular than with the pointed style, i. e., their character is late Norman. Above these is a colonnade of broad round arches, with an open colonnade to the roof of the aisles; and over these is a series of long, narrow, pointed, arched windows, with mullions, tracery, &c. We have abridged these judicious details from Mr. Britton's "Architectural Antiquities," wherein he has bestowed upon the Abbey Church a more than usual portion of illustrative plates.¹

(1) To Mr. Britton's minute illustration of this picturesque archaeological glory of his native county, we are indebted for much

We have engraved, from an original sketch, the north-east view, showing the northern side of the nave, the north aisle, and the ruins of the central tower, with the lofty open arch, bold and grand, though partly mantled with ivy and evergreens, as if Nature were mocking the proud import of man's Art.

The entrance doorways to the church must have been elaborately beautiful: a fragment of the western doorway, with its enriched sculptured mouldings and capitals, remains; but the great decorative boast is the southern porch, the finest piece of Norman architecture and design in England, and believed by Mr. Britton to be "unparalleled in arrangement, in elaborate execution, and in the number and variety of its sculptured ornaments." The exterior portal is composed of eight concentric arches, receding one behind another, and covered to the base with sculptured knot and trellis-work, foliage, and medallions inclosing figures. Along the sides of the interior of this porch are benches; the walls above are partly covered with an arcade of semicircular arches, springing from projecting brackets; and near the top, on each side, was a series of large seated and flying figures, in half-relief. The inner doorway, from the porch to the aisle of the church, is richly dignified with sculpture: it has an impost, or lintel, in the tympanum of which our Saviour is represented within the symbolical figure, the *Fesica picta*; and on the right of this portal is a stoup.

It is much to be regretted that these magnificent ruins have not yet been adequately explored and illustrated. A curious proof of the neglect of the memorials of the abbey, more than two centuries since, occurs in Mr. Britton's valuable "Memoir of John Aubrey," lately published. It appears that when Aubrey, in 1633, "entred into his grammar at the Latin schools at Yatton Keynel, in the church," the fashion was to cover the books with parchment, or old manuscript, which Aubrey says he was too young to understand, but he was pleased with "the elegance of the writing and the coloured initial letters." He continues: "I remember the rector (Mr. William Stump), great gr. son of St. the clothier of Malmesbury, had several manuscripts of the abbey. He was a proper man, and a good fellow; and when he brewed a barrell of special ale, his use was to stop the bung-hole (under the clay) with a sheet of manuscript. He sayd nothing did it so well, which no thought did grieve me then to see." Upon this, Mr. Britton notes: "In 1798 I visited a farmer at Charlton, near Malmesbury, named Stump, who had some curious manuscripts, and several large folio volumes, in an old chest. These were, probably, the remains of the spoil, which passed, with the manor and abbatial edifices of Malmesbury, to his ancestor Stump, the clothier." The rector stopping the bung-hole with an abbey manuscript is almost as great a desecration as stopping a barrel with the dust of Alexander!

The town of Malmesbury is "a fine old place." Its famed market-cross has fared better than the abbey, and has been judiciously restored. It is of octagonal form, with eight open arches, and a pinnacle at each angle, whence springs a flying buttress to a richly ornamented central turret, with eight sculptured figures in niches. Leland quaintly describes this cross as "a right fair and costely peace of worke in the market-place, made all of stone, and curiously vaulted for poore market folkes to stand dry when rayne cometh."

In connexion with the abbey, we must not omit to

elucidation of the history of the Abbey; as well as to access to his collection of drawings of the prominent architectural beauties, original memoranda, notes, &c. With the true enthusiasm of a green old age, he writes of the Abbey, "I wish I could devote a volume to it" (Nov. 24, 1846.)

(1) The *Fesica Picta* is the mystical figure, of a pointed oval form, common in middle-age ornaments, the outline of which is yet retained on the seals of many of our ecclesiastical courts. This symbol originated in the figure of a fish, (*piscis*), afterwards changed to an oval-shaped compartment, pointed at both extremities, bearing the same mystical signification as the fish itself, and formed by two circles intersecting each other in the centre.

mention that William of Malmesbury, one of the most truthful of our old historians, was when a boy placed in the monastery whence he derived his name, where, in due time, he became librarian, and, according to Leland, precentor, and ultimately refused the dignity of abbot. He is said to have been born in Somersetshire about 1095 or 1096: his father was a Norman, his mother an Englishwoman. He is generally supposed to have died about 1143. His diligence was untiring, and his love of truth an excellent feature of his literary character; for, of his own times, he declares that he has recorded nothing that he had not either personally witnessed, or learned from the most credible authority.

Returning to the Abbey ruins, in the loneliness of their decay, we feel the force of the epigraph appended by Hearne to one of his views of the crumbling pile:

"Oh! it pities us,
To see these antique towers, and hallow'd walls,
Split with the winter's frost, or mould'ring down,
Their very ruins ruin'd; the crush'd pavement,
Time's marble register, deep overgrown
With hemlock, or rank fumatory, hides,
Together with their perishable mould,
The brave man's trophies and the good man's praise,
Envyng the worth of buried ancestry."

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. XIII.

HOW LAWLESS BECAME A LADY'S MAN.

"FRANK, I am not at all satisfied about your sister," began Oaklands, as the door closed after her. "She does not look well, and she seems entirely to have lost her spirits."

"I thought as you do, before I went up for my degree," replied I; "but since my return, I hoped she was all right again. What makes you imagine her out of spirits?"

"Oh! several things; she never talks and laughs as she used to do. Why, all this afternoon I could scarcely get half a dozen words out of her; and she seems to have no energy to do anything. How unwilling she appeared to enter into my scheme about the riding! She evidently dislikes the idea of exertion of any kind: I know the feeling well; but it is not natural for her; she used to be surprisingly active, and was the life and soul of the party. But what, perhaps, has caused me to notice all this so particularly, and makes me exceedingly uncomfortable, is, that I am afraid it is all owing to me."

"Owing to you, my dear Harry! what can you mean?" inquired I.

"Why, I fear that business of the duel, and the great care she and your mother took of me, (for which,—believing, as I do, that under Providence it saved my life,—I can never be sufficiently grateful,) have been too much for her. Remember, she was quite a girl; and no doubt seeing an old friend brought to the house apparently dying must have been a very severe shock to her, and, depend upon it, her nerves have never recovered their proper tone. However, I shall make it my business to endeavour to interest and amuse her, and you must do everything you can to assist me, Frank; we'll get all the new books down from London, and have a few people to dine at the Hall. She has shut herself up too much; Ellis says she has; I shall make her ride on horseback every day."

"Horseback, eh!" exclaimed Lawless, who had entered the cottage without our perceiving him. "Aye,

that's a prescription better than all your doctor's stuff; clap her on a side-saddle, and a brisk canter for a couple of hours every day across country will set the old lady up again in no time, if it's your mother that's out of condition, Frank. Why, Oaklands, man, you are looking as fresh as paint; getting sound again, wind and limb, eh?"

"I hope so, at last," replied Harry, shaking Lawless warmly by the hand; "but I've had a narrow escape of losing my life, I can assure you."

"No; really, I didn't know it had been as bad as that! By Jove, if he had killed you, I'd have shot that black-hearted villain, Wilford, myself, and chanced about his putting a bullet into me while I was doing it."

"My dear Lawless, I thank you for your kind feeling towards me; but I cannot bear to hear you speak in that light way of duelling," returned Oaklands, gravely; "if men did but know the misery they were entailing on all those who cared for them by their rash acts, independently of all higher considerations, duelling, and its twin-brother, suicide, would be less frequent than they are. When I have seen the tears stealing down my father's grief-worn cheeks, and witnessed the anxious, painful expression in the faces of the kind friends who were nursing me, and have reflected that it was by yielding to my own ungoverned passions that I had brought all this sorrow upon them, my remorse has often been far harder to bear than any pain my wound has caused me."

At this moment, my mother and Fanny making their appearance, I hastened to introduce Lawless, who, being greatly alarmed at the ceremony, grew very red in the face, shuffled my mother into a corner of the room, and upset a chair against her, stumbling over Harry's legs, and knocking down the chess-board in the excess of his penitence. Having with my assistance remedied these disasters, after stigmatizing himself as an awkward dog, and comparing himself to a bull in a china-shop, he turned to Fanny, exclaiming,—

"Delighted to have the pleasure of seeing you at last, Miss Fairleigh; it is several years since I first heard of you. Do you remember the writing-desk at old Mildman's, eh, Frank? no end of a shame of me, spoiling it, I have often thought so since; but boys will be boys, eh, Mrs. Fairleigh?"

My mother acquiesced in this obstinate adherence to their primary formation on the part of the junior members of the nobler sex with so much cordiality, that Lawless was encouraged to proceed.

"Glad to find there's a chance of seeing you out with us some of these days, ma'am; shall we be able to persuade you to accompany us to-morrow?"

"Yes, I think it very likely that I may go," returned my mother, who imagined he was referring to some proposed drive; "in what direction will it be, pray?"

"Direction, eh? Why, that of course depends very much on what line he chooses to take when he breaks cover," returned Lawless. My mother, who had been previously advised of Lawless's sporting metaphors, concluding that the "he" referred to Sir John Oaklands, calmly replied,

"Yes, certainly, I was mentioning the ruins of Saworth Abbey to Sir John, yesterday; do you know them?"

"I should think I did, rather," exclaimed Lawless, forgetting his company manners in the interest of the subject. "Why, I have seen more foxes run into in the fields round Saworth than in any other parish in the country. Whenever the meet is either at Grinder's End, or Chorley Bottom, the fox is safe to head for Saworth. Oh! I see you're up to the whole thing, Mrs. Fairleigh; we shall have you showing us all the way across country in fine style to-morrow. I expect there'll be some pretty stiff fencing though, if he should take the line you imagine, but I suppose you don't mind any thing of that sort; with a steady, well-trained hunter,

(and a lady should never ride one that is not,) there's very little danger—take care to keep out of the crowd when you're getting away; don't check your horse at his fences; have a little mercy on his bellows over the heavy ground; and with a light weight like yours, you might lead the field. Why, Frank, you ought to be proud of Mrs. Fairleigh. I tell you what,—the first time the hounds meet near Leatherly, I'll have my mother out, whether she likes it or not. I'll stand no nonsense about it, you may depend; she shall see a run for once in her life, at all events. Mrs. Fairleigh, ma'am," he continued, rising, and shaking her warmly by the hand, "excuse my saying so, but you're a regular brick,—you are indeed!"

The scene at this moment would not have made a bad study for a painter. Oaklands, having struggled in vain to preserve his gravity, was in fits of laughter. Fanny, who had from the first perceived the equivocal, was very little better, while my mother, completely mystified, sat staring at Lawless, whom she evidently considered a little insane, with an expression of bewildered astonishment, not unmixed with fear. As soon as I could contrive to speak, (for Lawless's face when he had discovered the effect he had produced, completely finished me, and I laughed till the tears ran down my cheeks,) I explained to him that it was my sister, and not my mother, who was thinking of riding, while the notion of hunting originated wholly and solely in his own fertile imagination.

"Eh? What? she doesn't hunt?—ah! I see, put my foot in it pretty deep this time; beg pardon, Mrs. Fairleigh—no offence meant, I assure you. Well, I thought it was a very fast thing for an old—I, that is, for a lady to do. I fancied you were so well up in the whole affair, too: most absurd thing, really; I certainly am not fit for female society. I think, when the hunting season's over, I shall put myself to one of those tip-top boarding-schools, to learn manners for a quarter; the sort of shop, you know, where they teach woman her mission,—(how to get a rich husband, eh, Frank?)—for 300*l.* a-year, washing and church principles extra, and keep a 'Professor' to instruct the young ladies in the art of getting out of a carriage on scientific principles, that is, without showing their ankles. Didn't succeed very well with my sister Julia, though; the girl happens to be particularly clean about the pasterns, so she declared it was infringing on the privileges of a free-born British subject, vowed her ankles were her own property, and she had a right to do what she liked with 'em, and carried out her principles by kicking the Professor's shins for him. Plucky girl is Julia, she puts me very much in mind of what I was when I was her age at Eton, and pinned a detonating cracker to old Botherboy's coat-tail, so that, what between the pin and the explosion, it's my belief he would have found himself more comfortable in the Battle of Waterloo than he did the first time he sat down:—ah! those were happy days!"

Thus running on, Lawless kept us in a roar of laughter, till Oaklands, pulling out his watch, discovered it was time to return to the Hall, and prepare for dinner. It turned out on examination that the habit did require altering; so the ride was put off till the necessary repairs should be executed. As the next day proved too frosty to hunt, Lawless and I, under the auspices of the head keeper, set to work to slaughter the supernumerary pheasants, Sir John and Harry joining us for a couple of hours, though Ellis would not allow the latter to carry a gun. We had a capital day's sport, and got home just in time to dress, and Sir John having contrived in the course of the afternoon to carry off my mother and Fanny, we were a very comfortable little party. Sir John took my mother down to dinner, and Lawless paired off with Fanny, an arrangement which, as his eccentricities evidently afforded her great amusement, I was not sorry for.

"Why, Fanny," whispered I, when we joined the

ladies in the drawing-room, "you are growing quite frisky; what a row you and Lawless were making at dinner-time! I have not heard you talk and laugh so much for many a day."

"Oh! your friend is famous fun," replied Fanny,— "perfectly irresistible; I assure you I am delighted with him,—he is something quite new to me."

"I am so glad you have asked Lawless here," observed I to Oaklands; "do you see how much pleased and amused Fanny is with him: he appears to have aroused her completely—the very thing we were wishing for. He'll be of more use to her than all of us put together."

"He seems to me to talk a vast deal of nonsense," replied Harry, rather crossly, as I fancied.

"And yet I can't help being amused by it," replied I; "I'm like Fanny in that respect."

"I was not aware your sister had a taste for that style of conversation. I confess it's a sort of thing which very soon tires me."

"Splendid old fellow, Sir John," observed Lawless, in an under tone, seating himself by Fanny; "I never look at him without thinking of one of those jolly old Israelites who used to keep knocking about the country with a plurality of wives and families, and an immense stud of camels and donkeys; they read 'em out to us at church, you know,—what do you call 'em, eh?"

"One of the Patriarchs, I suppose you mean," replied Fanny, smiling.

"Eh—yes, that's the thing. Noah was rather in that line before he took a nautical turn, wasn't he? Well, if you can fancy one of these fellows decently dressed now in a blue coat with brass buttons, knee shorts and silk stockings, like a Christian, it's my belief he'd be the very moral (as the old women call it) of Sir John; uncommonly handsome he must have been—better looking than Harry, when he was his age."

"Mr. Oaklands is so pale and thin now," replied Fanny.

"Eh! isn't he just?" was the rejoinder. "Many a man has been booked for an inside place in a hearse for a less hurt than his; and I don't know that he's out of the wood, even yet."

"Why, you don't think him worse?" exclaimed Fanny, anxiously. "Nothing has gone wrong—you have not been told—are they keeping anything from me?"

"Eh! no! 'pon my word; Ellis, who is getting him into condition, says he's all right, and will be as fresh as a colt in a month or two. Why, you look quite frightened."

"You startled me for a moment," replied Fanny, colouring slightly; "any little relapse renders Sir John so uncomfortable, that we are naturally anxious on his account."

"I am sure Lawless is boring your sister," observed Oaklands, who had been sitting quite at the farther end of the drawing-room, cutting open the leaves of a new book. "I know that worried look of hers so well:—I shall go and interpose in her behalf.—Lawless," he continued, crossing over to him, "the billiard-room is lighted up, if you like to challenge Fairleigh to a game."

"Billiards, eh?" returned Lawless; "why, really, if you had walked as many miles to-day as I have, I don't think you'd much fancy trotting round a billiard-table. Besides, I'm very well off where I am," he added, with what was intended for a gallant glance towards Fanny; "here's metal more attractive, as the fellow says in the play."

Oaklands's only reply was a slight curl of the lip, and, turning to Fanny, he said, "Are you at all inclined to take your revenge? We shall have time for a good game if we begin at once; will you come into the music-room, or shall I fetch the chess-men here?"

"Is it not rather late?" replied Fanny, hesitatingly.

"Not if we begin now," returned Oaklands.

"Mr. Lawless offered to show me some tricks with cards; as they will not take so long a time as a game of chess, perhaps that would be most advisable this evening."

"Whichever you prefer, I will ring for cards," replied Oaklands, coldly. He then waited until the servant had executed the order, and as soon as Lawless had attracted public attention to his performance, left the room unobserved.

Wonderful things did the cards effect under Lawless's able management,—very wonderful indeed, until he showed you how they were done; and then the only wonder was that you had not found them out for yourself, and how you could have been stupid enough to be taken in by so simple a trick: and very great was Lawless on the occasion, and greater still was Ellis, who was utterly sceptical as to the possibility of performing any of the tricks beforehand, and quite certain, as soon as he had seen it, that he knew all about it, and could do it easily himself, and on trying, invariably failed; and yet, not profiting one bit by his experience, was just as sceptical and just as confident in regard to the next, which was of course attended by a like result. Very wonderful and very great was it all, and much laughter did it occasion; and the minutes flitted by on rapid wings, until my mother discovered that it was time for us to start on our walk to the cottage, a mode of progression of which Sir John by no means approved, he therefore rang the bell, and ordered the carriage. While they were getting it ready, Harry's absence was for the first time observed, and commented on.

"Did any body see when he left the room?" inquired Sir John.

"Yes," replied I, "he went away just as Lawless began his performances."

"Dear me! I hope he was not feeling ill," said my mother.

"Ill, ma'am!" exclaimed Ellis, "impossible; you don't know Mr. Oaklands's constitution as well as I do, or such an idea could never have occurred to you; besides, you can't for a moment suppose he would think of being taken suddenly ill without having consulted with me on the subject beforehand. I must go and see after him, ma'am, directly, but it's quite impossible that he should be ill," and as he spoke he left the room with hurried steps.

"My dear Fanny, how you made me jump! I hope you haven't done any mischief," exclaimed my mother, as Fanny, moving suddenly, knocked down the card-box, and scattered the contents on the carpet.

"I am sadly awkward," returned Fanny, stooping to pick up the box, "I do not think it is injured."

"My dear child, it does not in the least signify," said Sir John, taking her kindly by the hand, "why, you have quite frightened yourself, you silly little thing; you are actually trembling; sit down, my dear, sit down,—never mind the cards. Frank, if you'll ring the bell, Edmunds will see to that."

"No, no! we'll pick 'em up," exclaimed Lawless, going down on all fours, "don't send for the butler; he's such a pompous old bird, if I were to see him stooping down here, I should be pushing him over, or playing him some trick or other. I shouldn't be able to help it, he's so jolly fat. What a glorious confusion! kings and queens and little fishes all mixed up together!—here's the knave of clubs hail-fellow-well-met with a thing that looks like a salmon with a swelled face! Well, you have been, and gone, and done it this time, Miss Fairleigh—I could not have believed it of you, Miss Fairleigh, oh!"

"Mind you pick them all up properly," retorted Fanny; "if you were really such a conjuror as you pretended to be just now, you would only have to say 'hocus pocus,' and the cards would all jump into the box again in proper order."

"Then I should have lost the pleasure of going on my knees in your service. There's a pretty speech for

you, eh! I'll tell you what—you'll make a lady's man of me now, before you've done with me. I'm polishing rapidly,—I know I am."

"It's all right!" exclaimed Ellis, entering. "I found Mr. Oaklands lying on the sofa in the library; he says he feels a little knocked up by his walk this morning, and desired me to apologize for his absence, and wish every body good night for him. I say, Fairleigh," continued he, drawing me a little on one side, "has any thing happened to annoy him?"

"Nothing particular, that I know of," replied I; "why do you ask?"

"I thought he looked especially cross; and he called our friend Lawless an intolerable puppy, and wondered how any woman of common sense could contrive to put up with him,—that's all," rejoined Ellis.

"Fanny refused to play chess with him, because she thought it too late in the evening;—that cannot have annoyed him?"

"Oh, no!" was the reply. "I see exactly what it is now: since the granulating process has been going on so beautifully in the side, his appetite has returned, and as he must not take any very active exercise just yet, the liver is getting torpid. I must throw in a little blue pill, and he'll be as good-tempered as an angel, again; for naturally there is not a man breathing with a finer disposition, or a more excellent constitution, than Mr. Oaklands. Why, sir, the other day, when I had been relating a professional anecdote to him, he called me a 'blood-thirsty butcher,' and I honoured him for it,—no hypocrisy there, sir."

At this moment the carriage was announced, and we proceeded to take our departure, Lawless handing Fanny in, and then standing chattering at the window, till I was obliged to give him a hint that Sir John would not like to have the horses kept standing in the cold.

"You've made a conquest, Miss Fan," said I, as we drove off; "I never saw Lawless pay such attention to any woman before; even Di Clapperton did not produce nearly so strong an effect, I can assure you."

"I am quite innocent of any intention to captivate," replied Fanny. "Mr. Lawless amuses me, and I laugh sometimes at, and sometimes with him."

"Still, my dear, you should be careful," interposed my mother; "though it's play to you, it may be death to him, poor young man! I got into a terrible scrape once in that way, myself, when I was a girl; laughing and joking with a young gentleman in our neighbourhood, till he made me an offer one morning, and I really believe I should have been persuaded into marrying him, though I did not care a bit about him, if I had not been attached to your poor dear father at the time: now you have nothing of that sort to save you, so as I said before, my dear, mind what you are about."

"I don't think Mr. Lawless's heart will be broken while there is a pack of hounds within reach, mamma dear," replied Fanny, glancing archly at me as she spoke.

As we were about to proceed to our several rooms for the night, I contrived to delay my mother for a moment under pretext of lighting a candle for her, and closing the door, I said,—

"My dear mother, if, by any odd chance, Fanny should be inclined to like Lawless, don't you say any thing against it. Lawless is a good fellow; all his faults lie on the surface, and are none of them serious; he is completely his own master, and might marry any girl he pleased to-morrow, and I need not tell you would be a most excellent match for Fanny. He seems very much taken with her, and no wonder, for she is really excessively pretty; and when she is in spirits, as she was to-night, her manner is most piquant and fascinating."

"Well, my dear Frank," was the reply, "you know your friend, and if he and Fanny choose to take a fancy

to each other, and you approve of it, I shall not say any thing against it."

Whereupon I kissed her, called her a dear, good old mother, and carried up for her, in token of affection, her work-box, her reticule, her candle, and a basket, containing a large bunch of keys, sundry halfpence, and three pairs of my own stockings, which wanted mending, a process which invariably rendered them unwearable ever after.

READINGS IN HISTORY.

THE COURT OF STAR CHAMBER.

THE accession of Henry VIII. changed the appearance of proceedings in the Star Chamber, for being in early life of that jovial disposition which courts power for mere selfishness, not from any desire of doing good, loving money more for the pleasure of expending than of possessing it, and aware of the unpopularity of his father through the proceedings of the Star Chamber, he encouraged the council to inquire into the conduct of the "promoters" of that court—"promoters" they were commonly called because they "promoted many honest men's vexations." The notorious Empson and Dudley, with others, were sent to the Tower immediately after the king had been proclaimed. A general pardon was signified for all offences except murder, felony, and treason; and restitution was promised to all who had wrongfully sustained injury through the nefarious practices of the late king's commissioners of fines and forfeitures. The council was besieged by applicants, some who had not suffered with those who had done so; and the natural result of this clamour was that the council very soon relinquished the promised justice. The "promoters" were fined, set in the pillory, and otherwise punished, in such a manner as to offer opportunity of revenge to the people, of which the latter so heartily took advantage, that three of the offenders died in Newgate, a few days after their exposure, of the injuries received from the populace. The law could not touch Empson and Dudley; but in compliance with the clamours of the people, they were accused of a treasonable conspiracy, convicted, and condemned to death; perhaps they would not have been executed had not Henry in his first "progress" after his accession found himself annoyed by cries against the unpopular ministers, and they were accordingly beheaded. Empson's forfeited mansion, with its orchard and gardens, situated in St. Bride's, Fleet-street, and occupying the portion of ground now Salisbury-square and Dorset-street, was bestowed on Wolsey, 1510.

But the Court of Star Chamber still existed, and under the administration of Wolsey it afforded the latter the opportunity of furthering his own advancement; though it must be remarked that "there prevailed in this court neither the pecuniary meanness which was its prominent vice under his immediate predecessors, nor the cruelty which distinguished it at a later period." Henry VIII. found the juries of the ordinary courts sufficiently submissive to his cruel tyranny, which did not stop at fines and forfeitures; the court of Star Chamber had no power to decree death, and Henry, "who spared no man in his wrath," was obliged to have recourse to common law.

Wolsey exhibited his wonted magnificence in his attendance at the Star Chamber, surrounded by noblemen, and preceded by "cross-bearers and pillar-bearers." He is reported to have been impartial in his judgment of causes, although but too willing to weaken those noble families who opposed themselves to his ambition. He likewise punished both nobles and meaner men for overbearing conduct "in their countreyes;" so that the poor man no longer lived in such

fear as he had done. After his fall little is heard of the Star Chamber in public cases; the following are a few of those which occurred during the reign of Henry VIII.; the first proves how little the private business of the subject was respected when the so-called honour of the king was in question.

Two bills having been published slandering the "King's Highness, and his most honourable council," two aldermen and a knight were appointed in each ward of the city, to go to every merchant and dealer's house, not only to inspect their books of business, but to bring away the last book, seal it, and convey it to Guildhall, there to be duly searched, "whether there be in them any such like hand as is contained in the said bills, or any of them, and thereupon to be re-delivered to the merchants after due search made." It has been well remarked that Guildhall would "see another sight" if the books of the shopkeepers of London could now be gathered together by any such summary proceeding.

Thomas Lucas, a privy councillor, was sent to the Tower for speaking scandalous words of the Lord Cardinal.

Lord Dacres, of the North, acknowledged that he had been negligent in the punishing of thieves, and that he had taken one, called Hootor Carleton, into his house, knowing him to be a thief. His Lordship was committed, but soon released.

The Court of Star Chamber seems to have been, or pretended to be, a careful guardian of private morals; for it desired the principals of the Inns of Court and Chancery not to suffer the gentlemen students to be out of their houses after six o'clock at night, "without very great and necessary causes, nor to wear any kind of weapon."

The Earl of Surrey, Thomas Wyatt, and young Pickering, were summoned for breaking windows, and eating flesh in Lent; all were committed to the Tower, but afterwards discharged.

Slandrous words of the king or council, seditious expressions, prophecies, "talking of the Scripture," were punished with the pillory. An executor was fined for making proclamation that the debts of the deceased person would be paid by him; the making of proclamations being a royal privilege, and one of which the king made royal use, for Cranmer received order from the Star Chamber and the king to declare the marriage of Anne Boleyn illegal, even before she had been brought to trial.

A story quoted from Lord Chancellor Ellesmere will show the state of the law as regarded wills, which were particularly cognisable by the Star Chamber.

"A friar coming to visit a great man in his sickness, and finding him past memory, took opportunity, according to the custom of the times, to make provision for the monastery whereof he was; and finding that the sick man could only speak some one syllable, which was for the most part, 'Yea,' or 'Nay,' in an imperfect voice, forthwith took upon him to make his will, and demanding of him, 'Will you give such a piece of land to our house to pray for your soul?' the dying man sounded, 'Yea.' Then he asked him: 'Will you give such land to the maintenance of lights to our Lady?' The sound was again, 'Yea.' Whereupon he boldly asked him many such questions. The son and heir standing by, and hearing his land going away so fast by his father's word, 'Yea,' thought fit to ask one question as well as the friar, which was, 'Shall I take a cudgel and beat this friar out of the chamber?' The sick man's answer was again 'Yea,' which the son quickly performed, and saved unto himself his father's lands."

We now approach a darker period, which we can but briefly notice. The coronation of Edward VI. marks an important change in the manner of assuming the crown; the people being asked if they would serve him as rightful and undoubted inheritor, by the laws of God and man, to the royal dignity and crown imperial

of the realm ; all recognition of popular choice being thus left in oblivion. The short reign of Edward is now better understood, and the promise of the king's character more correctly read, than in the days when Hume inculcated "the right divine of kings to govern wrong;" we read of fines and imprisonments, in which doubtless the Star Chamber bore its accustomed part, whether for treason or religion; and we find the Commons refusing to concur in some tyrannical cases. So also with Mary, who found the lower house of Parliament very untractable. Here, again, we meet with the Court of Star Chamber imprisoning and fining the jury that acquitted Sir Nicholas Throgmorton, who was concerned in Wyatt's rebellion. The unpopular marriage of Mary with Philip of Spain was likewise announced to the people by a Star Chamber proclamation.

In Elizabeth's reign the Star Chamber interfered less than it had formerly done in civil suits, but became an engine of the state as a court of criminal judicature; and Elizabeth seems to have shown her parentage in this as in many other respects. Fuller says, "It was cause and reason enough to bring a sheep to the market, that he be fat." We have more painful cases than mere fines of Star Chamber justice. The court took report of mass being said, the usual penalty being 100 marks; and it was likewise one of the engines used against the Puritans even in this anomalous reign. The story of Lady Catherine Grey and the Earl of Hertford is well known; this was a Star Chamber prosecution. The law of libel was the offspring of this court, which punished "breach of proclamations before they have the strength of an act of parliament." London was now much increased, and to avoid its overgrowth informations were laid in the Star Chamber against persons who built houses. One citizen, having let his rooms to two poor persons who lived by relief from their neighbours, was fined, and the court ordered that the tenants should pay no rent for the rest of their lives; it being thought inconvenient to pull the house down, as had been ordered in other cases. The prohibitions of Elizabeth and James as to the erection of new houses arose partly from a regard to the health of the citizens, but we suspect much more from a dread of the increase of religious and political disaffection. The great crowd of his countrymen who followed James to the metropolis, and the numbers of religious enthusiasts who found their harvest about the court, may well have alarmed that poor burlesque upon royalty, whose reign, were it not for some *intensely dark* shadows upon its motley pages, might be called the comic chapter of English History. In compliance probably with the sovereign's fears, the Star Chamber issued proclamations, enjoining all persons who had residences in the country to quit the capital and repair to them; on failure of obedience many persons were fined, some of them being ladies. The history of James's religious persecutions belongs to a graver subject than the present, but the Star Chamber was here also the engine of tyranny. The discovery of the Gunpowder Plot was but the beginning of executions for treason, religious or political; and the Star Chamber figures throughout in a character of increasing tyranny. The king required money to feed his own favourites and his son's extravagance; people were brought into the Star Chamber on all kinds of accusations, in order that their fines might for a time satisfy the wants of the king; monopolies and privileges were used for the same purpose; and those men who would not contribute to benevolences were enormously fined in the court. It is needless to mention examples, they are read in every page of the reign. The proceeding against Selden is truly said by Mr. Hallam to be "as much the disgrace of England, as that against Galileo, nearly at the same time, is of Italy."

Gladly do we leave the reign of the imbecile James, but unwillingly do we enter upon that of his faithless and misguided son, upon whose devoted head the sins

of centuries poured their accumulated punishments. The odious Star Chamber soon made its voice heard; and the proclamations of this reign are far more numerous than those of the preceding one. The prices of minor articles were thus fixed—even of poultry, butter, and coals—while the general restrictions upon trade were still more vexatious. Upon an alleged breach of charter, the Star Chamber fined the city of London 70,000*l.*, forfeiting the charter to the king; and in this matter the king is said to have personally taken an active share, in order to secure a sentence in his favour. No one was allowed to go beyond seas till he had undergone an examination, and taken an oath of a "very inquisitorial nature." The story of Lord Vaux is well known, and too long to be repeated here; the proceedings of Charles against those members of his third parliament whom he termed the "vipers," Elliot, Hollis, and others, are equally well known. Charles soon after found that the worm, when trampled on, will turn upon its oppressor. Meanwhile, London was increasing, despite Star Chamber fines and the destruction of the new buildings; Puritanism was gaining strength, despite the persecutions of Laud; and the man who was to vindicate the liberties of England was preparing to act his part in the forthcoming tragedy.

The Parliament of 1640 met; Capel delivered a petition from Hertfordshire against ship-money, monopolies, the Star Chamber, Court of High Commission, &c.; the subject of grievances was discussed; the supplies refused or withheld; and the Parliament dissolved. Again it met in November of the same year; Strafford's tragedy followed; and in the following July, the king, after much delay, passed the two bills, putting down for ever the Court of High Commission, instituted by Elizabeth, and the detestable Court of Star Chamber. It may be thought that we have not dwelt with sufficient emphasis upon the last and most tyrannical acts of the subject of our paper, but the events of the reign of Charles I. are familiar to every one; and our object was not to show forth those events even as connected with the Star Chamber, so much as to exhibit the growth of an abuse which, springing from old and neglected statutes, attained a strength incompatible with the health of a government professing itself free, while the people were scarcely aware of its existence. As the Stuarts suffered the consequences of Tudor rapacity and tyranny, the crimes of the Star Chamber are often charged upon Charles only,—it was not so; and this lesson ought to teach the people to watch narrowly a small but increasing evil, while the sovereign learns the wisdom of reforming an abuse while the people will accept such a reform as a boon, not delaying till they demand it as a peace-offering.

F. C. B.

THE NYMPH OF THE FOUNTAIN.

A FAIRY TALE.

ON the banks of the Neckar, in one of those petty strongholds whose ruins are now so picturesque, there lived about the year 1180 a baron noted for his courage, and who was from his rapacity the terror of all merchants and travellers. He had married the beautiful daughter of a neighbouring feudal lord, who soon made herself as well loved by his vassals, as she had previously been by her father's; and, much as their characters differed, he loved her, and, won by her gentle persuasions, often showed a degree of indulgence his followers had never before experienced from him.

One fine summer evening, about two years after her marriage, the baroness was walking alone in the garden of her castle, thinking sadly of the disappointment her husband continually expressed at their having no children, when, as she passed a fountain, the clear

The Nymph of the Fountain.

sparkling of whose waters had often drawn her attention, she saw a figure sitting beside it. She went nearer, supposing it some poor woman come to ask her help or advice, for she was continually among the sick and needy, and was looked up to by all around the castle when sorrow of any kind visited them. As she approached the figure, it rose and came to meet her, and she saw a beautiful and graceful lady, handsomely dressed, though all in white, and covered from head to foot with a thin white veil, sprinkled with drops of water. The stranger addressed her, saying she was the Nymph of this Fountain, who now made herself visible to console one who had so often brought comfort to others; that she knew the cause of her sadness, and could promise that, before the year was ended, she should hold a little daughter in her arms. "But," continued the nymph, "I foresee that you will not live to complete her education, and that she will be exposed to great dangers;—I wish to be her godmother, that I may protect and guide her." The baroness gladly accepted this offer, and the nymph,—after exacting a promise that she would not tell her husband of the interview, or who the godmother was to be till she herself should inform him at the ceremony, before which event she would no more be seen,—turned towards her fountain, stepped into it, and disappeared. The baroness felt much cheered by the hope thus given her; nor did the prospect of an early death, which accompanied it, materially damp her pleasure, for she had seen suffering and sorrow enough to feel little love for life,—she knew her husband would not lament her long, and the Nymph of the Fountain's offered guidance assured her that, even to her child, her place would be well supplied. Many weeks had not elapsed before the baron was delighted with the hope of soon being, at length, a father. He determined that no expense should be spared in the christening, to prove the importance of his family, and often amused himself with settling all the details. He named a powerful noble of the district, his ally and frequent comrade, as godfather, and was considering whom he should select for the godmother, when his wife said he must leave that to her,—she had a particular fancy to choose for

herself. He asked whom she wished to have, but she smiled and said she must prove to him that she *could* keep a secret, though he had so often asserted that no woman ever did. He was very curious, but she laughed at him for showing a weakness he had often ridiculed as peculiar to women, and assured him that her choice was one which would fully satisfy him, but he was not to know it till the time arrived, when the godmother would announce herself. The baron was ashamed to ask more, but he often tried by indirect questions to find out his wife's plan: however, the baby was born, and the day of christening came without his being the wiser on this point.

One by one the company entered the castle hall, and were led by the baron to his wife and child; each laid some present beside the cradle,—still no godmother appeared, and all began to feel impatient, when, just as the baron was insisting on his wife's telling him whom she expected, the Nymph of the Fountain glided in. To all but the baroness she was a stranger, nor did she make herself known to any but the parents of her intended godchild; but the richness of her dress, the pleasure their hosts evidently felt in receiving her, and the respect they showed her, prevented any other expression among the guests than of wonder who she could be. And this was increased by the contrast between her present—a little brown ball of turned wood, scented with musk—and those of so many friends, and especially of the godfather, who had given a splendid baptismal robe. Even the baroness felt somewhat disappointed at seeing it, and still more her husband, who, on welcoming the fairy godmother, had formed great expectations for his child, and even for himself. But the movement to the castle chapel soon withdrew every one's attention.

The godmother took the baby in her arms, and held her in due form, while she received the name of *Maud*. Then followed the christening feast, at which the Nymph of the Fountain took her appointed place; but early in the evening she departed, unperceived by all except the baroness, to whom she said, as she took her leave,—

"My gift is of more value than it appears to be; three times in your daughter's life it will give her a gift at her choice;—but three times only;—so preserve it carefully, and teach her not to throw away its powers, but to reserve them for moments of real emergency. It has one other property; it will at any time save her from fire; so let it be always about her. I tell you this, because you will see me no more; but I shall watch over you, and when my godchild comes to need my aid, I shall be ready to give it."

With these words she glided from the hall, and, as soon as the baroness could leave her guests, she carefully secured the precious ball in a case, and tied it to her child's cradle.

A few years passed, and little Maud, still an only child, became the constant companion of her mother, who much needed such a comfort; for her husband had gradually neglected her more and more; she found her influence almost gone when she still pleaded for the poor and suffering, and her health, too, declined, slowly but steadily. Maud was hardly six years old when she lost her excellent mother; and though the baron grieved for a time, and felt that he had been unkind and negligent, he soon resumed his old way of living, and the year had hardly elapsed, when he brought home another wife, who soon showed herself the very reverse of her predecessor. Proud and haughty, she cared not for the poor; they were driven away if they dared to come to the castle, as they had been used to do; and, vain of her beauty, she encouraged her husband in all sorts of extravagance, which obliged him to increase his exactions on all within his power, so that he grew more cruel and rapacious every day. The new lady never gave herself much trouble about poor little Maud, who was left to the care of servants, and, in truth, neglected by every one but her old nurse. Even her father soon ceased to notice her, for his new wife brought him a son, and Maud was no longer of the slightest consequence in his eyes. The poor child felt very unhappy, having been used to live entirely with her mother, and to be the constant object of affection. She spent much of her time in the garden; sometimes playing by herself, sometimes talking to her old nurse, or sitting by the fountain, on a stone which had been a favourite seat of her mother's. She had no new playthings given her now; indeed, her stepmother took away from her all that was worth keeping to give to her own children. But the little wooden ball was thought too shabby for any one else, and Maud always kept it from habit; because her mother had so often warned her not to lose it, though she was too young to understand its value.

One day she was rolling it along a gravel walk, running after it, when it turned a little aside, and dropped into the fountain. Poor Maud sprang to the water's edge, but the pool was too deep,—she could see nothing of her ball; and she began to cry. Suddenly the water moved, and a lady, covered with a silvery gauze veil, rose from the midst, holding the ball in her hand. Maud was a good deal frightened, but the sight of her ball prevented her from running away. She stood doubting, and the lady slowly came towards her, smiling sweetly, and addressed her in a very kind voice. She told her she was her godmother, and a friend who had much loved her departed mother; that the ball was her gift, and she now restored it; but it must be more carefully kept; not used as a plaything, but secured to her dress, and never parted with: the reason of this she said Maud should know when she was older. Meanwhile, she questioned her about her lessons, and found that since her mother's death the child had had no teaching, and was likely to have none, but was quite willing to learn as her mother had accustomed her to do. The Nymph regretted that her duties at the court of the Naiad Queen had detained her so long from her charge, but now she had returned home, and resolved at once to fulfil her promise to the late baroness. So she desired Maud to come every day to

the fountain, and to throw a little pebble into it, saying she would come whenever she thus summoned her, and teach her all she ought to know. Maud was delighted at the idea; and every day she contrived to spend two or three hours with her kind godmother, in the little arbour beside the fountain, without anyone's knowing or caring where she passed her time; for her old nurse had been dismissed just about the time of the loss of the ball in the well; and the new baroness was too much taken up with company and visiting to go much into the quiet garden.

Years rolled on, and Maud grew into a beautiful girl, full of sense and energy, and well versed in every accomplishment of the age,—from spinning and sewing, and the humblest household economy, to such learning as was not then common, even in the highest ranks. Nor had her good godmother neglected religious instruction and the guidance of her heart. She had taught her to excuse and pardon the harshness of her stepmother, to yield to all the tyranny of her half-brothers and sisters, and to follow her mother's example in visiting and comforting the poor by every means in her power; showing her, that though she had little or nothing to give, yet sympathy and advice were often more valuable than money, and that she could always do good, by instructing the children, and encouraging the sick and unhappy to see God's merciful hand, even in their worst sufferings. Such visits as these were the only pleasures of Maud; for her step-mother had no idea of bringing into society one whose innocent, youthful beauty must have thrown her quite into the shade. But, even in these, Maud found a source of much anxiety, in the daily increasing conviction of her father's unpopularity among his vassals, and the rumours she heard of the neighbouring towns becoming tired of his exactions, while his brother nobles were little likely to support him, many having been affronted by himself or his wife in various ways. Poor Maud several times attempted to warn him, and to persuade him to greater mildness, but without success. He cared not for her, and his wife's influence always more than counteracted hers.

At last, one night she was roused from sleep by sudden shrieks of "Fire! fire!" She sprang from her bed, partly dressed herself, and ran towards her father's room. But the galleries were full of armed men! The castle had been surprised, and set on fire by the neighbouring peasants, helped by the soldiers of a city which had long complained of the interruption to their commerce caused by the baron's rapacity, and of the usage he had given some of their people, who fell into his hands. She heard their cries of vengeance, and soon saw that it was too late to attempt warning or defence; for such of the garrison as remained alive had joined the attacking party, and their shouts told her that her father had already perished! She next tried to join her half-brother,—a boy now nearly twelve years old;—but before she could reach his chamber, his dead body was dragged past her, and she herself was seized by some of the town-soldiers, who did not know her except as belonging to the hated family. She took her musk-ball from the pocket she always carried it in, hurriedly unscrewed it half,—for her godmother had long ago taught her how to use it,—and repeated in a whisper,—

"Before me night, behind me day;
That none observe my secret way."

and immediately she was surrounded by a cool mist, and found herself free from the grasp of the soldiers. She quitted the castle, but lingered about, hoping that some at least of her family might escape, till she saw the invaders one by one driven off by the flames, and heard, from their exclamations of triumph, that she was alone in the world—an orphan without a friend! Her godfather had been dead some time; nor was he a character she could have sought protection from if he had been alive. She knew not whither to turn: she ran to the

fountain in the garden, to seek her kind godmother's advice, but no lady appeared, though she threw in pebble after pebble, and begged her most earnestly to speak to her. At last, poor Maud turned away in despair.

Without money, almost without clothes, of a name so hated in the district that she dared not make herself known, as her best safety lay in the idea that she had perished with the rest of her family, her very beauty was a fresh danger. She determined to disguise herself, and go to a distance, where she might, perhaps, earn her bread, even it were as a hired servant. So she went to the cottage of her old nurse's family, where she knew they would not betray her, and exchanged her clothes for some of her foster-sister's; she next stained her face, hands and arms with herbs, and put a hump of rags upon her shoulder, thus disfiguring herself as much as possible. In her hand she carried a bundle of tidier clothes, still those of a peasant girl, and began her journey. She wandered on for several days, till she thought herself safe alike from pursuit and from detection, begging her food and lodging, after she had consumed the small provision her foster-sister had forced her to accept; but when she found herself in a totally strange country, and among people who evidently knew nothing of her or of her family, she determined to seek a service. She applied at various houses in vain; some did not want a maid; other would not take a complete stranger, and one who acknowledged she had never been in place before. At last, she came to a large desolate-looking castle; in the village near it she learned that the owner was in Palestine, and that the castle had been for several years inhabited only by an old housekeeper, who had grown more and more capricious, till she could not keep even one servant long, having driven away all the retainers in succession, except, of course, the small garrison who guarded the fortifications, and with whom she had nothing to do. No one from the neighbourhood would accept the place, and she was now vainly seeking for a helper; perhaps she might take the stranger, but the villagers were sure no one could remain with her a week. Maud was too anxious to be independent of charity to feel daunted at this account. She went up to the castle, passed easily through the open wicket into a court-yard overgrown with grass, and lifted the heavy knocker of the hall door. The sound echoed through the empty apartments, and, after some minutes, an old woman opened a lattice beside the door, put out her head, and asked, in a very cross voice, who was there. Maud answered timidly that she heard a servant was wanted, and she came to offer herself. The old woman cross-questioned her minutely and sharply; she replied always by the simple truth, that she was an orphan from a considerable distance off, whose father and family had all perished in a late skirmish; that she had escaped by flight, had wandered for many days, and now sought to earn her bread in any respectable place, willing to work hard for it. The housekeeper objected a good deal, commenting on her appearance of delicate health, (for she was worn with fatigue and grief,) and on her never having been at service; but Maud assured her that her health was good, and unimpaired by her crookedness; that she perfectly understood most household work, and would gladly learn any thing she might be found deficient in. So the old woman, who was tired of serving herself,—for she had been two or three days without any one,—and pleased besides with Maud's simplicity and sweet temper, agreed to take her on trial. She withdrew the heavy bolts of the door, grumbling all the time,—and Maud entered her new home.

What a change for her, born and educated on a level with its master, to find herself taken, as a favour, for a servant-of-all-work to the old grumbler! But she determined to submit cheerfully, remembering that the heaviest misfortunes are sent for our good, and that there is no lot which has not its bright side, if we

will but seek it, instead of shutting our eyes, as so many do, to all that lightens our trial, and fixing them only on the most painful side. True, she was an orphan, reduced suddenly from affluence to absolute poverty; highly educated, yet forced to mix with the most ignorant; nobly born, yet obliged to seek a menial station, and with no prospect of any change for the better. But she had health and a cheerful temper; she was sure of food and protection while she remained here, and she had seen and heard enough of the sufferings of the poor to prize these highly. Then she knew that God, who had seen fit so to afflict her, could, in his own good time, restore her to all she had lost, if he should so please; and if not, that she could save her soul as securely, and probably more so, than if she had remained in her father's castle.

As these thoughts passed rapidly through her mind, she reached the kitchen, following the steps of Dame Gottfried, who had been preparing her supper when summoned away by the knock at the hall door. Maud immediately set about cooking it, with so much neatness and quickness, that the old woman added, without grumbling, as much as made a good meal for the new comer. When they had finished eating, Maud put every thing away, washed the plates and dishes, put fresh wood on the fire, swept the hearth, and asked the housekeeper for some work for the evening. This readiness pleased her new mistress exceedingly, and she replied, "No, child; you must be tired with your journey; you shall rest yourself this evening, and tell me more about yourself; to-morrow, I have plenty for you to do." So, as they sat before the fire, she continued her questioning, but far less sharply than at first, and Maud began to hope that the dame was not so ill-natured as people said, and that she might, perhaps, remain permanently here. To all the old woman's queries she replied much as she had done before, even giving her real name, though, of course, without any designation of rank; for, at such a distance from home, she thought there was no danger in this. She told how her mother had died when she was young, and her father had married again, and her godmother had educated her; and, suppressing any circumstances that might betray her real rank, she described the enemy breaking into her home at night, the fire, the death of her father and brother, and her own flight, not mentioning the fairy-ball, which she carefully kept about her.

When it grew rather late, the old woman showed her where she was to sleep, and charged her to be up with daylight,—a thing she declared she could never get the lazy creature who had run away the other day to do. Maud promised, and soon fell fast asleep, but not without saying her prayers, and earnestly begging help to bear well all that might happen to her, resigning herself cheerfully into God's hands, to remain in her present lowly station as long as he pleased,—for life, if he should require it; and only imploring of him that she might never offend him, and that he would have mercy on the souls of her parents and relations.

With the first ray of light she awoke, much refreshed, dressed herself quickly, said a few short but fervent prayers, and hurried to Dame Gottfried's bed-side. She found her just getting up, and much pleased with the new maid's diligence; though she muttered, at the same time, a hope that it would last, and an observation that new brooms always sweep clean. Before the housekeeper was dressed, Maud had lighted the kitchen fire, and began to prepare the breakfast. She got through that day very well,—not without some scoldings to be sure, but she soon found that, if the old dame was obeyed without an answer, she would not grumble long; and that, in truth, much of her crossness arose from her sufferings, for she was infirm and rheumatic. She got every day fonder of Maud, who gradually felt some attachment to her, from habit and pity, and even a degree of gratitude, though in truth Dame Gottfried gave her much to bear, and often very little thanks.

When she had been nearly a year at this castle, there came news of the death of its lord in Palestine; and some months after came orders to prepare for the reception of its new master, his brother, a Knight Templar, who had distinguished himself much in the Holy Land. The old housekeeper had grieved a good deal for her young lord, who had died unmarried, and the more because, his only brother being a Templar, she feared that the family, of whose antiquity she was very proud, would be extinct. But with the news of his intended return came a rumour that, in consideration of his being the last of an ancient and noble line, he had been released from his vows, and came home to seek a wife, and establish himself in the castle of his ancestors. This almost reconciled the old dame to seeing herself surrounded by the new domestics who crowded the long-solitary halls, and partly superseded by the steward, who had accompanied his lord to Jerusalem, and now resumed his post in the new household. She found her authority over the maids still undisputed, and would have given Maud an easier place, but she preferred remaining in the kitchen, saying she was more used to it, but in reality because she thought she should be there most safe from suspicion; and, notwithstanding her disguise, she feared discovery of either her rank or her beauty. She had never removed the hump, or permitted her hands and face to resume their natural colour, and Dame Gottfried had not the smallest idea that she was any thing but what she seemed—an active, intelligent, sweet-tempered, but crooked peasant girl. Maud was not so certain that the younger eyes of the new inmates might not pierce her disguise, and she resolved to mix as little as possible with the other servants, and attend solely to her work and to the housekeeper, who kept her a good deal with herself, liking her assistance better than that of strangers or new comers.

(To be continued.)

A SKETCH OF DOMESTIC LIFE¹

CHAP. IV.—EXPLANATIONS.

To make our good Jacob appear less faulty, we now communicate to the reader the origin of his love, and also many circumstances which had contributed to its growth, of which even his parents were not aware.

One day he went with a young companion to take a stroll through the fields. Conversing cheerfully, and allowing their minds to wander in the charming regions of ideal fancy, the two young men contrived to lose their way. Fortunately, a good angel appeared, to save them from perplexity; a beautiful girl, in the garb of a peasant. Our lost travellers hastened towards the lovely apparition, who seemed more charming still when she gave them a clue to retrace their path. After repeated thanks they took leave of her, saying to themselves that such an angel might well allure poor souls from one labyrinth into another. However, such was not the case now, and the two friends soon forgot their adventure.

The neighbouring village of Waldensen was under the pastoral care of Jacob; its inhabitants attended the church in the town on Sundays, and Jacob in the week gave instruction to the young people of both sexes, fitting them to join in the communion. Among the village girls was the heroine of the labyrinth. Her name was Else, and she was the daughter of a sawyer in middling circumstances. Jacob's instruction was given, not only as a duty, but with an earnest zeal which elevated the minds of his young pupils. He was no common priest; he supported schools, was an active friend to the needy and suffering, and besides, as a preacher, he spoke

from the fulness of his own heart to the hearts of his hearers.

The attention which Else gave, her talents, and pure religious feeling, interested her teacher deeply. Even after his instructions were ended, Jacob took a lively interest in the welfare of his youthful flock. It was his custom to visit the parents, and give good advice, and assistance on various occasions. Thus when the sawyer of Waldensen determined to place his daughter at a school, at some distance, to study French, needlework, and other feminine accomplishments, the young curate procured her introductions to respectable families in the neighbourhood. Jacob was not like many of his clerical brethren, who when they have strewed the seed, as is the duty of their calling, care nothing for its future growth.

About a year after this, Jacob saw Else among his congregation. She had returned home, a beautiful and blooming young woman. Her appearance delighted him; he seemed raised above all earthly things. He had never before preached so well. Else fixed her eyes on the young preacher with devotion. He, her teacher and benefactor, appeared a being sent to bless the world, for whom all must feel love and veneration. Jacob was much alarmed, when, a few days after, he heard of the sawyer's intention to send his daughter to be maid at an inn. The young clergyman begged him to desist, and pointed out the rudeness to which Else might be exposed, at such a place, the resort of idle travellers, dissolute soldiers, loiterers, and adventurers. Jacob used every effort to place his young pupil in some respectable family. At last, an attendant and first instructress being wanted for the Elder's youngest children, Mother Anna assented to the earnest wishes of her son, and thus Else became an inmate in the family of Danielis.

CHAP. V.—MASTERS AND SERVANTS.

Her new situation was indeed a blessing to the young girl; for in the Elder's patriarchal household all the domestics, high and low, were treated with attentive kindness. They were regarded as part of the family, they shared every joy and sorrow, and were encouraged in all good by Danielis and his excellent wife. No complaints of unworthy and idle domestics were ever heard in this family. It was a frequent saying of the Elder, that if a wife is worthless, it is often the husband's fault; if children grow up ill, it is the parents' fault; and if the servants are bad, it is the fault of the master and mistress, especially if the latter is incessantly scolding and reproving, or lowers herself by vulgar familiarity. The Elder's wife did not think it beneath her dignity to interest her servants in the proceedings of the family, to instruct in domestic affairs, and in all that might be useful and improving to their minds. Also, when, in the evening, Danielis told his children of the riches and products of the earth, and the wonders it contains, related adventures of travellers, or showed the heavenly bodies through his telescope, some of the household were always present. Else, in particular, never failed to attend earnestly to all she heard, and was never missing from the circle when she had disposed of her young charges.

The neighbours of Danielis thought all these proceedings very ridiculous, even dangerous. One cousin Maultasch, who paid frequent visits to the Elder's family, and wished to rule every thing, was quite indignant. She was an excellent specimen of a certain class; a stout, fidgety dame, by no means a bad woman in reality; affable, fond of society and of talking much; always trying hard to have the last word. Her hawk's eye discovered at a glance the slightest irregularity in any one's dress, and penetrated into every corner in any house she entered. In youth, her affections had been generally bestowed; in age, she atoned for this,—by going assiduously to church, and by displaying her active piety at the tea-tables of her acquaintance, in

(1) Continued from p. 317.

sharp-tongued, malicious observations upon every one she knew. One day, the good dame surprised her cousin in the act of explaining to his domestic circle, by means of an electrical machine, the aurora borealis, the cause of storms, and the use of lightning conductors. Else, as well as the children, was attentively taking notes.

"Is it possible?" cried she, as soon as she was alone with Danielis,—and we quote the conversation, as it expresses the public's opinion of the Elder's conduct,— "is it possible?" exclaimed she, clasping her hands in amazement. "What can you be going to make of Else—a female professor? I beg, my dear cousin, that you will consider what you are doing."

"I have considered," answered Danielis; "as this young girl belongs to my household, I wish to make her as good and intelligent a creature as God has willed her to be."

"But, cousin, with your permission, are you not carrying matters too far? When we engage a domestic, we want no science and learning beyond what is their duty, and we give them maintenance and wages, as—"

"Mules, oxen, and asses," quietly observed the old man.

"Let me speak!" exclaimed cousin Mautasch, in some ill-humour. "To give the common people knowledge which they can never use, is encouraging an obscurity of ideas, of which they have already too much. Really, my good cousin, this is strange; as if there were not schools enough to teach poor people all that they need to know."

"Yes! there are schools where children are taught reading, writing, and arithmetic, and are left in the grossest ignorance concerning every-day occurrences: yes! of even what is most necessary for their future life. What are girls taught of the aims and management of domestic life?—what instruction does the village lad gain in husbandry? The workman leaves school ignorant of the commonest knowledge of nature; the mechanic is totally unacquainted with the powers and qualities of bodies on which his labour is to be bestowed. From this cause arises the helplessness of the people, and the increasing poverty of the lower classes."

"Cousin, that is no concern of ours; it is the business of the government to remedy such things."

"No;—it is our concern; for we also belong to the people; and the improvement of the people must spring from themselves. Government have other things to attend to. Each man should try to improve those in his immediate circle."

"Cousin Danielis, I really am not able to understand you."

"There is the misfortune. Well, we will turn to another subject,—the state of religion among the people,—mankind are educated in outside devotion; they go to church, hear sermons, learn prayers; and yet, few of those who consider themselves Christians ever really know God."

Frau Mautasch opened her eyes wide, exclaiming, "Good heavens! you cannot mean that we are heathens in spite of our churches and schools?"

"Very nearly so, I fear. Our youth know the forms of religion, but not the christianity of the heart. I lead my children and my household, not only to the church built of stone, but to a temple formed by the Almighty's hand, where he shows himself through his works in all nature; in the infinity of suns and revolving stars, between which our earth hovers like a grain of sand; in the great world of animalcules, among which we breathe; in the mysterious government of the wonderful powers of nature. See, my good cousin, this is God's temple, to which I guide my children,—where they learn to become pious and sincere Christians."

Cousin Mautasch shook her head. The conversation lasted some time; but these fragments are sufficient to give an idea of it.

CHAP. VI.—ANOTHER VISIT.

The mother's tender and earnest letter made a deep impression on her son. She had said to him exactly what he, as a teacher and friend, would have said to another under like circumstances; and Jacob was conscientious enough to demand from himself what he would have required from another,—obedience to the dictates of reason and duty.

Our daily experience proves how much easier it is for a clergyman to shine in the pulpit, than to be always true and faithful in his intercourse with mankind, and just and honest in his own heart. Jacob would have blushed to become an actor in the priestly garb: he used strong efforts to command his passions and feelings. He could not banish from his soul the beloved image; but when it rose up before him in all its beauty, he fixed his mind on some engrossing subject, which diverted his thoughts, in a measure, from his love. He denied himself the pleasure of frequent visits to his home; and when occasionally he allowed himself that gratification, it was only for a short space; he never spoke to Else, and scarcely ventured a glance towards her. She, on her part, seemed to look calmly at his coming or going, and tried neither to meet nor avoid him. But the mother, with a woman's delicate perception, thought she could trace a faint glow on Else's fair cheek when, by any chance, she and Jacob met. The anxiety of the parents ceased by degrees, as they witnessed the prudent conduct of their son, and they fancied they had made the affair of too much moment.

The threatened outbreak of war, in consequence of the Revolution of 1830 in Paris, excited and alarmed every one. Italy, Belgium, and Poland, were in a disturbed state, striving against their rulers, who, proud of their restoration to power, mistook the spirit and the just desires of the people which they professed to govern.

These stirring times made Danielis, like most others, an eager newspaper reader; but he often threw the gazette aside, disgusted at its servile party spirit. One day he stepped to the open window of his room, which looked out on a smooth lawn, surrounded by gay flower-beds; his eyes wandered over fields, meadows, the river, and through the neighbouring town, as though he sought to calm his mind, now ruffled by thoughts of the malignant barbarity of his fellow-creatures.

"One could almost imagine," said the Elder, giving utterance to his thoughts aloud, "that this beautiful world was destined as a place of correction for fallen spirits."

"Not for all! not for all!" answered a gentle female voice. It was Else, who was in the garden with little Christian, chasing him in play up and down the gravel walk, as if seeming anxious to take from the laughing child his basket of flowers which he had gathered for his brothers.

"She is right," thought Danielis, looking down at the play-fellows with silent pleasure. "Not for all! Your innocent souls have heaven only around them. Oh! forsake not your God." And, pursuing his reflections, he added, "Why do we love our children so tenderly? Is it only through a blind impulse of nature? No! It must be something higher. It is because we feel their innocent bliss, which we have in a great measure lost; it is because we know how much purer they are than ourselves."

Else knelt down before the little one, played with him, and held fast his tiny hands, while she sang a baby-song, "*Ainsi jout, jout, jout, les petites Marionnettes.*" The fair-haired Christian jumped up and down, in imitation of his pet play-things, and then threw himself, laughing, upon Else, who kissed him fondly, and carried him away in her arms. The young girl's movements were full of grace. Her rustic dress, far from disfiguring her slender form, heightened its

beauty. The dark, violet-coloured jacket, fitting close to the figure, the scarlet-bound petticoat, scarcely covering the delicate ankles and small feet; the black velvet neck-band, with silver spangles, setting off the exquisite whiteness of her graceful throat; all exhibited Elsie's beauty as much as the richest attire could have done. Her dark eyes, glistening with playful mirth; her cheeks and lips glowing with health; her hair falling in thick curls over her snowy forehead, made diamonds and pearls useless.

"The boy has not bad taste," said the old man, as he thought of his son. "Even the caprices of Fortune show the infinite wisdom of the Creator. In the lowest of mankind we sometimes perceive the greatest intelligence,—a Socrates, a Phocion, a Cincinnatus, a Franklin, or a Washington Irving, often stands unknown with his brilliant talents behind the plough or the loom, while mediocre spirits rule at the head of the government, the army, and the church. So also we find among women many who, fitted by nature to be princesses, live in obscurity: while others, whom she has treated like a cruel step-mother, move in the highest ranks. Yes, indeed," mused the Elder, "the boy has not chosen ill; strange, that he should so lightly have given up his fancy."

A noise behind him interrupted his meditations, and in a moment Danielis was embraced by the son who was uppermost in his thoughts.

"What brings you here so unexpectedly, my dear Jacob?" asked the father, after the first welcome, with an anxious expression of feature.

"An affair very near my heart, dear father; and a most important one. I want your advice and consent," answered the young man earnestly.

"An affair of the heart—an important one," repeated the Elder, scarcely able to conceal a smile; "I know it already; I understand you."

"No, father, you do not understand me,—it is impossible you could," Jacob eagerly said, colouring deeply the while. "But are you at leisure? May I lay the whole matter before you?"

"Let me hear it, my dear son; I am quite curious to know what it is."

(To be continued.)

TRAP-DOOR SPIDERS.

Should a traveller, newly arrived from some far-off land, and well supplied with tales of wonder and of interest, proceed to relate the history of some formidable member of the brute creation, endued with sufficient address and ingenuity to contrive a dwelling with a door set on hinges, and closing with a spring of its own making, so as to be inaccessible from without during the owner's pleasure; and if, moreover, he were to state that this animal, careful of his own safety, no sooner finds any attempt made to open the door, than he holds fast on the inner side, and pulls with all his might, just as a human being might do—such a traveller would be indebted to his own character for veracity rather than to the probability of his story, for the degree of belief he might gain from his hearers.

Now this, which would appear marvellous if recorded of one of the larger animals, is the constant mode of working of the trap-door spiders, whose small size and comparative insignificance have caused their extraordinary performances to be little noticed except by professed entomologists. These creatures, inhabitants of tropical climates, are patient and laborious miners, hollowing out for themselves in the ground a cylindrical dwelling, sometimes as much as nine inches deep, and an inch and a quarter in diameter. This dwelling they line with silken web, of a beautifully fine and smooth texture, numerous layers of which are placed one over the other, until the thickness is about that of

strong cartridge paper. This beautiful lining is yet further strengthened in any part of the nest which seems liable to injury, whether from the pressure or the dampness of the surrounding earth. But the greatest amount of skill and labour seems to be bestowed upon the lid or trap-door, which the spider forms as the mode of ingress and egress. This door is about the eighth of an inch thick, and is composed of alternate layers of silken web and of earth; having also a strong silken hinge, of sufficient elastic force to close of itself immediately on being opened.

Among English observers, those who have given the most curious accounts of these insects are Mr. Sells and Mr. Saunders, whose elaborate notices enrich the pages of the *Entomological Transactions*. Divesting their papers of scientific and technical details, we gather the following particulars. The former of these gentlemen describes the species found in Jamaica, which island he inhabited for more than twenty years. It appears that large districts of the central parts of that island consist of a reddish argillaceous earth upon a limestone honeycomb rock, and the country is so hilly as to be termed mountainous; the red dirt, as it is commonly called, occupies the valleys, and more scantily covers the hills, where it is mixed with vegetable mould, and nodules of the rock; the latter is in vast masses, and sometimes appears in large isolated portions, with perpendicular surfaces of from ten to thirty feet square. Under the rocks or trees, in sheltered situations, the spider constructs its nest, finding there a soil well adapted to its labours, being little exposed to the extremes of either heat or moisture. The spider is of a very robust and compact shape, well adapted to its business as a miner, but there is considerable difficulty in watching the progress of his work. Nests were, however, dug up in different stages of forwardness, and these exhibited the skill of the architect. They also showed that the spider begins at the top of the nest, and works downwards, for occasionally only the lid and an inch or two of the tube were completed. In this state the delicate texture and unfinished appearance of the specimen reminded the observer of one of those skeletons of houses, which require to be plastered and lined in order to strengthen and finish them, before they are fit to be inhabited. Those parts of the ingeniously contrived fabric which called for more particular admiration were the lid and a valvular apparatus found inside and immediately below the hinge.

The lid or trap-door is not much unlike the upper shell of an oyster, inasmuch as it is on the upper surface rough, laminated, thick and strong near the hinge, and becoming thinner towards the surrounding edges. The elastic force by which the lid, on being opened, closes of itself, is principally accomplished by a fold or duplicature of the webbing, at each end or angle of the hinge, so that upon raising the hinge, which cannot be done without violence, much beyond a right angle with the aperture, this fold is also opened, and the threads of the webbing are put upon the stretch in proportion to the extent to which the lid is elevated, and which, doubtless, in its proper use, by its lawful owner, never exceeds the insect's requirements. The internal underside of the door is exceedingly firm and smooth, well fitted to resist friction and resistance, and to facilitate at all times the expeditious exit and entrance of the insect. In some cases there was observed a beautiful and curious apparatus of valves, one placed immediately beneath the hinge, the other about three quarters of an inch lower down. It appears very improbable that this additional apparatus can be without its appropriate use, and yet the fact that some of the nests are unprovided with it shows that it is not universally necessary. Mr. Sells suggests the following explanation. In newly constructed nests the reacting elastic power of the hinge may be all-sufficient, and continue so for a considerable time; but from long-continued use, the effect of weather, or other incidental causes, it may lose its

spring, when the superadded construction of the valves may effectually restore its efficiency; as it is evident, upon close inspection, that the opening of the lid acts first upon the upper one, and this again upon the lower, which again sends out numerous elastic threads downwards. If this explanation be correct, as Mr. Sells justly remarks, "It is calculated to double our admiration of this creature's workmanship; proving, as it does, that the great Architect of all has gifted this interesting insect with such a measure of accommodating instinct."

Another species of trap-door spider is that found in the Ionian islands. During a short excursion to Zante, Mr. Saunders noticed a number of the nests, and took up several for the purpose of examination. These nests were found close round the roots of the olive-trees, in a somewhat elevated situation, and were generally observed two or three together, about the same tree. The soil was a sort of sandy clay, of a light ochraceous colour. The upper portion of the nests was partially raised above the surface of the ground, but this might have arisen from the washing away of the surrounding earth during the heavy autumnal rains, the more especially as a coating of moss on the upper surface of the lid showed, in many cases, that the nest could not be of very recent construction.

There was a very remarkable peculiarity about the nests of this species, consisting of a projecting portion of the lid, directly above the hinge, to the extent, in some instances, of one-third of the diameter of the lid. The object of this projection is supposed to be to supply a lever, on the slightest touch of which the lid should be raised, just as in some heavy tankards we find a projection near the hinge, which enables us to raise the ponderous cover with facility. The spider appears to have produced this lever by simply extending in that direction the respective layers of which the lid is composed. The readiness with which the opening of the lid is effected by this ingenious contrivance of a lever might lead one to suppose that an extra degree of care would be displayed in regard to the means of firmly closing the same from within, in the event of an outward attack, but no such provision appears to have been made in the case of this species; although in some others there are little hollows into which the insect inserts its claws when holding the door together. Another peculiarity in this species was, that the extreme end of the nest within the ground was not unfrequently constructed somewhat upon the same model as the top, being provided with a second door, smaller in size, but otherwise similar to that at the top. This second door was long a puzzle to the discoverer, no apparent use for such an opening being found. But on a second visit to the Mediterranean, a more extended research into the habits of these creatures gave a greater insight into this, as well as other points of their history.

Several nests were taken from the ground in the month of October, and incased in some of their natural earth within a small box, the top of which was closed with bars of wood. This box remained in a balcony, neglected and unopened, until the month of April following, when the spiders were all found alive and well, clinging to their trap-doors in order to prevent the same from being opened. For this purpose they firmly grasped, with the four anterior feet and palpi, the bulb of the coverlid, the other feet resting low down upon the posterior walls of the nest, while the sharp mandibles were firmly inserted into the front part of the tube, near the top. Thus fixed they offered a powerful resistance to the opening of the door. The upper portions of two of these nests, which had been accidentally broken in the process of extraction, were then placed in an open flower-pot, with a sufficient quantity of the same earth, well moistened and compressed, so as to form a compact body in imitation of the soil itself, the spiders clinging all the while to the trap-door, without regard to their temporary exposure

through the broken part of the tube. Thus imbedded, it remained to be seen whether they would construct a new bottom to their nests, and whether such bottom would be closed where the tube now terminated, or be carried farther down into the earth to the usual depth. A third spider was placed in the same pot, with his nest purposely reversed, the trap-door being buried to the depth of about three inches, and the open end, where broken off, being placed on a level with the surface, in order that the insect might be tempted to adapt a new door to this part. But lest the spider should escape before the necessary steps could be taken to cover the pot with some transparent substance to observe the work, Mr. Saunders fixed a strong paper stopper in the tube of the nest, intending it to remain until the following day. But in the morning he found the paper stopper taken out, and laid aside, and the open end of the nest covered in with a single layer of web and earth, offering but slight resistance to the touch, although by no means transparent, and presenting the rudiment of a hinge, formed by the web of silk being here in a straight line, instead of rounded. The side near the hinge was also on a level with the surrounding earth, while the opposite side, where the door would open, was a little depressed. No attempt was made to open this new door, for fear of disturbing the spider; but in order to see whether he worked from without or within, a little flour was shaken over the lid to whiten it. The next morning, to the surprise of the observer, the new door was entirely cut away, and was lying by the side of the nest, while in its place was now found a strong texture of whitish web. This remained in the same state from the 26th of April to the 2d of May, when it occurred to Mr. Saunders that the spider had been obliged to leave off work in consequence of the earth not being any longer sufficiently moist for his purpose; he therefore gave the soil a good watering, allowing a few drops to fall on the silken door, by way of signal. The next morning a new door was found, quite complete, and constructed according to the usual manner. Thus this nest, when extracted from the ground, presented a trap-door at each end with elastic hinges, and every other requisite. This singular fact seemed to explain the circumstance, otherwise so unaccountable, of nests being found with doors at each extremity, and there is very little doubt, but that in turning up the ground around the roots of the olive-trees (which is done every year), some of these nests are upset and broken, and the spiders, as in the case of this one, immediately set to work to form a new door at the open end. The circumstance of the lower opening being smaller than the upper one would naturally occur in a nest so reversed, since the nests are often more capacious towards the bottom, so that, when inverted and broken off, the new door would be larger than the old one.

In the course of watching these spiders, it was found that some of them, annoyed perhaps by the frequent forcible opening of their doors, found out a new method of fastening them, and this was no other than weaving over them a firm texture of web, so that the door could not be moved without tearing away the strong silken fabric. By cutting off the top of one of the nests thus closed, it was seen that this fastening was not a mere bundle of threads near the opening, but a complete tapestry over the whole orifice of the nest, shaped like the interior of a thimble, and forming a texture of the most delicate whiteness.

The most remarkable circumstance affecting the insects themselves was, that all those subjected to examination appeared wholly to abstain from food, and made no visible efforts to entrap their prey. At the end of six months they appeared plump and healthy, and up to the time when Mr. Saunders closed his communication they were apparently well, although, from the situation of the box on a balcony on the first floor, the supply of food, if any, must have been exceedingly limited.

Poetry.

VILLAGE LYRICS.

No. III.—THE CHURCHYARD.

W. BRAILSFORD.

THE wanton wind that scattereth
The fairest leaves of June,
That often in the night-time wails
A melancholy tune;
All around the latticed windows
Will its defying voice
Over Nature's drooping moments
Triumphantly rejoice.

Aye, ever while the moonlight shows
The honeysuckle's bloom,
A hollow moan will interrupt
The stillness of the room,—
Bringing sad thoughts of withered flowers,
Buds that must bend and die,
Trees that must lose their leafy charms,
Sweet summer's livery.

But about the churchyard dreary,
Where weeds and nettles grow,
Where the costly sculptured marble
Mocks pauper graves below;
Over tomb and humble hillock
Trembles its weary breath,
As if it claimed affinity
With the solemn place of death.

Heavily sounds the passing bell;
All sadly rocks the tree;
Sighs will come from the laden heart,
All tranced thoughts to free;
Groves will lack their summer songs;
Bees will find no flowers;
Streams will lose their gentle tones,
And death will lessen ours.

Weep not, maiden! weep not, Time
Hath brighter days in store;
The seaman from his well-lov'd sea
Will break his vows no more.

Aye, weep not, though that reckless one
Lie buried fathoms deep,
Thy heart hath faith too pure and fond
For one so wild to keep.

Nay, weep not, mother! she who lay
So dead beneath thy feet,
Now mingles with her hymns of praise
A supplication sweet—
That thou may'st meet her in the realms
Of everlasting light:
So take thy thoughts from this dim spot,
And gaze upon the night.

The stars that glitter all so fair
Shall symbolize her worth,
And thou in their bright orbs shalt read
A message sent to earth;
A calm, glad meaning, left for thee,
To welcome and to prize;
So leave the dross to moulder here—
The treasure upward flies.

'Tis we, we bow and bend beneath
All woes of earthly form;
We shrink, and close our loving hearts,—
Poor martyrs in a storm.

Few pausings in our griefs we make,
But let the eyelids press
Fresh tears adown our palmed cheeks,
And court new wretchedness.

And thus we hold sad memories
Beneath the cypress-tree,
Clinging to shadows of the past
For very sympathy;

Thus shapen to funeral types
Our thoughts beside each tomb;
So wander in this place of death,
As we would share its gloom.

Miscellaneous.

SAILORS' FRANKS.

DURING the night, some of those on deck would come below to light a pipe or take a mouthful of beef and biscuit. Sometimes they fell asleep; and, being missed directly that anything was to be done, their shipmates often amused themselves by running them aloft with a pulley dropt down the scuttle from the fore-top. One night, when all was perfectly still, I lay awake in the fore-castle. The lamp was burning low and thick, and swinging from its blackened beam; and with the uniform motion of the ship the men in the bunks rolled slowly from side to side, the hammocks swaying in unison. Presently I heard a foot upon the ladder, and, looking up, saw a wide trousers leg. Immediately, Navy Bob, a stout old Triton, stealthily descended, and at once went to groping in the locker after something to eat. Supper ended, he proceeded to load his pipe. Now, for a good, comfortable smoke at sea, there never was a better place than the *Julia's* fore-castle at midnight. To enjoy the luxury, one wants to fall into a kind of dreamy reverie, known only to the children of the weed. And the very atmosphere of the place, laden as it was with the snores of the sleepers, was inductive of this. No wonder, then, that after a while Bob's head sank upon his breast. Presently his hat fell off, the extinguished pipe dropped from his mouth, and the next moment he lay out on the chest as tranquil as an infant. Suddenly an order was heard on deck, followed by the trampling of feet and the hauling of rigging. The yards were being braced, and soon after the sleeper was missed, for there was a whispered conference over the scuttle. Directly a shadow glided across the fore-castle, and noiselessly approached the unsuspecting Bob. It was one of the watch, with the end of a rope leading out of sight up the scuttle. Pausing an instant, the sailor pressed softly the chest of his victim, sounding his slumbers, and then, hitching the cord to his ankle, returned to the deck. Hardly was his back turned when a long limb was thrust from a hammock opposite, and Doctor Long Ghost, leaping forth warily, whipped the rope from Bob's ankle and fastened it like lightning to a great lumbering chest, the property of the man who had just disappeared. Scarcely was the thing done, when, lo! with a thundering bound, the clumsy box was torn from its fastenings, and, banging from side to side, flew towards the scuttle. Here it jammed; and, thinking that Bob, who was as strong as a windlass, was grappling a beam and trying to cut the line, the jokers on deck strained away furiously. On a sudden the chest went aloft, and, striking against the mast, flew open, raining down on the heads of the party a merciless shower of things too numerous to mention. Of course the uproar roused all hands, and, when we hurried on deck, there was the owner of the box, looking aghast at its scattered contents, and with one wandering hand taking the altitude of a bump on his head.—*Adventures in the South Seas.*

The Castle of Godrici de Bouillon.

THE CASTLE OF GODEFROI DE BOUILLON.

THE castle which our engraving illustrates is well known to all travellers in Belgium. It was repaired in 1827, and has since that period been used as a military prison. Situated far above the town of Bouillon, it has a most picturesque appearance. No part of the original castle remains, with the exception of the dungeons hewn out of the rock.

THE MAIDEN AUNT.—No. IV.

CHAP. II.

THE quiet and graceful nonchalance with which Edith received all the varieties of compliment, homage, and devotion, which were tendered to her acceptance, spoke volumes for the experience she had acquired since her first introduction into society. Yet it could scarcely be called indifference—certainly not that indifference which would seem to be the natural result of preoccupation; for she was keenly alive to all that passed around her, and her appetite for gaiety had none of that languor which is often the result of satiety, and which, though it does not begin with disgust, frequently ends with it. Lightly as she appeared to esteem the admiration of which she was the object, so long as it was undisputedly hers, it might easily be discerned that she would have felt its withdrawal as a trial of no light order.

Mr. Delamaine here broke in, panting under the enforced silence of the last five minutes. "Yes," cried he, "only just fancy shutting Thornton up from society. Why, now," addressing Miss Kinnaird, "I'll just tell you exactly, without further circumlocution, what Thornton is. He is the centre of every circle into which he goes."

"My dear fellow, don't be so geometrical!" said a voice from the window which opened upon the lawn.

Mrs. Dalton clapped her hands. "I thought you would not be able to contain yourself much longer," exclaimed she. "Come in, Godfrey! How long have you been within hearing?"

"Only since you saw me, half a minute ago," answered the new comer, cordially responding to her shake of the hand, and then turning to pay his compliments to the rest of the company. He was about eight-and-twenty years old, a little below the middle height, but formed with singular grace and symmetry. His hair was dark and profuse, his face rather picturesque than handsome, his voice and manner peculiarly gentle, his eyes full of fire. After the ceremonies of greeting and introduction were at an end, he seated himself on a low ottoman at Mrs. Dalton's feet, his eyes seeking Edith's face with a frequency which nothing but good breeding prevented from degenerating into a fixed stare, and requested to be enlightened as to the subject under discussion.

"We were talking," began Mr. Delamaine, "of society in general."

"Of society in particular, I should say," interrupted Sir Mark Wyvil.

"Didn't somebody say something about seclusion?" inquired Lady Selcombe from her bay-window.

"It was Miss Kinnaird," replied Lord Vaughan, "who was celebrating the praises of a life of seclusion."

"No, no, my dear fellow," exclaimed Mr. Delamaine; "I beg your pardon, but you entirely mistook Miss Kinnaird's meaning. She only said that she should like to live in complete retirement, she were going to be an artist."

"I did not exactly mean that," interposed poor Edith, suffering from the embarrassment which so frequently befalls a woman when, having been betrayed by impulse into the expression of a sentiment at variance

with the ordinary course of small talk, she is condemned to hear a distorted paraphrase of it quoted as hers by some afflicting bystander, and is thereby involved in the necessity of denying, defending, or explaining words, which she now feels that it was folly to utter at all.

Mr. Thornton's face expressed a mixture of sarcasm and impatience, restrained by politeness. Wisely deeming, however, that his best method of securing the two ladies for himself, would be to keep the conversation at too high a level for the others to reach, he ventured to assume a tone somewhat graver than his wont, except in a tête-à-tête.

"I don't wonder," said he, "that seclusion should seem, in England, to be the only atmosphere in which art can breathe. Our miserable 'common sense,' as it is sarcastically called, is, in its way, as destructive of the true spirit of art as the frivolity of our neighbours the French."

"Yes," said Mrs. Dalton, "and the popular idea of beauty finds here its fit embodiment in the 'handsome and substantial,' while there it is in the fantastic and incongruous."

"But in Italy," suggested Edith, with some hesitation.

"In Italy," said Mrs. Dalton, "where common daily life is, as it were, steeped in poetry, and the present is so beautiful that it almost wins you from contemplating the past—and such a past!—art seems there to be born of nature, to come unsought and stay unasked."

"And is therefore undisciplined and impulsive, possessing men rather than possessed by them," returned Mr. Thornton.

"My dear Godfrey! what new theory is this?" cried his cousin in amazement. "You a painter, and decry the art of Italy?"

"You mistake me," replied he, smiling; "I was not speaking of works of art, but of the expression of their spirit in the actual life of the artist, moulding the structure of society into a correspondence with itself, so as to dispense with the necessity of seclusion to the production of its highest development. We must go to Germany for this—to Germany, which, if you will allow me to say so, leaves Italy as far behind in architecture, in music, and in poetry, as she is herself outstripped in painting."

"I could dispute that of all but architecture," said Mrs. Dalton.

"I will not allow you to do so,—at least not in music," answered he. "That which is passion in the one becomes spirit in the other—do you not feel the difference? But I know you do, for you expressed it just now far better than I could hope to do. The one, as you truly said, comes by nature: it is a cavern full of radiating crystals, where you walk in a labyrinth of bewildering beauty; but the other is a mighty temple, symmetrical and stately, reared by laborious and devout hands, symbolizing something which is above earth, and which art cannot represent except by symbol."

"And England," said Edith. "Will you allow us no art at all?"

"Nay!" cried Mr. Thornton; "we have had art of the first order, at least in poetry. But it must be content to be like that flower," pointing to a cactus; "it springs in sudden splendour out of a rugged and unsightly stem, which has no harmony or consistency with itself. The more fully we recognize its beauty, the more do we wonder at the strange and anomalous position in which we find it."

"It is a part of our national reserve," said Mrs. Dalton, "of the moral cowardice which accompanies our physical courage, of the strange timidity which makes us distrust alike the past and the future, and believe only in the present, because, and so far as, we actually see it before us. Our eyes are obstinately fixed on the planks of the boat which carries us, and we see

neither the leafy shore from which we have departed, nor the glowing depths of the sunset into which we are sailing."

"Don't call it by so high a name as *reserve*," cried Mr. Thornton. "Call it, as I did, *common sense*,—by which I mean a resolute adherence to conventionalism in defiance of original thought."

"Call it by what name you please," said Mrs. Dalton, "it is everywhere present with us, like fetters on the limbs and ice on the heart, and the only warmth and freedom one ever enjoys, is when one has succeeded in getting away from it for a few happy moments."

She spoke with a bitterness of tone very unusual to her; and Mr. Thornton, glancing round the room, replied with a well-satisfied smile, "We have got away from it now, Amy. This is one of those 'few happy moments.'"

Mrs. Dalton looked up, and perceived with some amazement that Sir Mark Wyvil had drawn his chair to Lady Selcombe's side, so as to be virtually absent from the *conversazione* party at the table, while Mr. Delamaine had seized on Lord Vaughan and carried him off to the terrace, where, within sight of the window, he was pitilessly inflicting upon him the deferred story about the ear-rings.

"Let us enjoy it while we can!" cried she. "Tell me, Godfrey, what have you been doing, thinking, and feeling, all this age that we have been separated?"

"For the *doing*, first," he answered, "I have been enduring society."

"What an expression!" exclaimed Edith, "and I am so fond of society!"

"So was I once," returned Mr. Thornton; "but since then I have looked under the surface, and the vision of what I saw there has haunted me from that moment forwards. Do you suppose that if the Diver had come back from those ghastly hollows where he saw the sea-hyænas and the hundred-jointed snakes, he could ever have admired the beauty of the ocean afterwards with an unruffled spirit?"

"You remind me," said Edith, "of that strange little poem of Milnes's, in which he describes the wretchedness of the soul which is forced to look upon the world as it really is, and to see the seeds of decay and death visibly present in the midst of life and beauty. If that would be the result of opening one's eyes, I would rather keep mine always shut."

"Milnes's poem," said Mrs. Dalton, "is only an amplification, and a feeble one, of Hamlet's grand idea;—I need not quote, need I?"

"If Mr. Delamaine were here," observed Edith, "he would give us the passage entire."

"Don't mention him," cried Mr. Thornton; "don't let there be a thought to break the unity of our 'one happy moment.' If you only knew what an indulgence this is to me after the life I have been leading for the last six months, mere charity would induce you to prolong it."

"But, if you detest society so utterly," said Edith, simply, "why do you not break away from it altogether? A man has always the privilege of being able to act independently of others—to follow the dictates of his own will."

"Yes," added Mrs. Dalton, "while a woman is—oh, give me a simile! Your favourite Germans would say she was like a Psyche in the grasp of the serpents—she may weep, implore, writhe in the toils—but she can never escape." Her manner was playful, but the same bitterness to which we have before alluded might be discerned beneath the assumed levity.

"My will is my Psyche," returned he; "it struggles and suffers, but has not strength to set itself free."

"But then," said Edith, "I think your desire to be free can scarcely be so very strong. There must be something else to contend with it."

"You are right," he replied, "I could not live in solitude. Sympathy is as necessary to me as the very air

I breathe. I am for ever seeking for it—accepting mere dross and tinsel instead of it—hugging them for a little while with a fool's fancy that they are real—finding out that they are not the true gold—slinging them away in wrath and scorn, and setting out anew upon the same search, to be again deceived, and to begin it all over again; till I am inclined at last to question whether there is really any such thing in the world, and whether, if there be, it is worth while to take so much trouble in looking for it. But I don't want to arrive at this conclusion, for if I were once thoroughly convinced of it, I believe I should take the first opportunity of walking out of the world altogether, by a shorter and more effectual way than merely secluding myself from it."

"No, you would not," cried Mrs. Dalton; "weakness of will would again beset you. Like Goethe, you would take the dagger to bed with you night after night, hold the point tenderly to your heart for half an hour, reasoning meanwhile most philosophically with yourself, then—go to sleep."

"If I am Psyche, you are the serpent!" exclaimed Mr. Thornton.

"Yes," retorted she, "but you would require no effort to escape from my toils."

"And now," said Edith, "you have told us what you have been thinking of during those six months: the third question was, what were you feeling?"

"Don't ask me," replied he, quickly; "I believe I never felt at all till this moment."

From most persons this speech would have sounded like a mere jesting compliment, but there was so strong a colouring of sentiment in Mr. Thornton's playfulness that Edith felt herself blush, and then blush doubly lest the first embarrassment should be misinterpreted.

"The dressing-bell rang ten minutes ago," said Mrs. Dalton, abruptly, "and Sir Mark and Lady Selcombe have already taken wing. Come, Edith, or we shall not have time to arrange our bouquets."

She quitted the room as she spoke, followed by Miss Kinnaird. Mr. Thornton sauntered to the window, and stood for some minutes listlessly gazing at the smooth green lawn, with its carefully grouped shrubs, trim borders, and delicate flower-baskets—no inapt, though certainly a most favourable symbol of the elegant conventionalisms of which he had just expressed his languid abhorrence. He was roused by a light tap on the shoulder, and, turning round, he beheld his cousin, her face radiant with restored good-humour.

"Now, Godfrey, what do you think of her?" cried she, eagerly.

"She is faultless," returned he, "or else I have lost my power to criticize. Amy, I must paint her picture. Do contrive it for me—you know you can manage anything and anybody, when you please."

"Even you?" inquired she, archly.

"Yes, truly," he answered. "Am I not here in obedience to your summons? though in this case to obey was to please myself."

"Ah!" replied Amy, "I am afraid that is always the secret of my power over you. I should not dare test it by asking you to do what did not please yourself."

"Nay, not seriously, my cousin," said he, taking her hand, and looking earnestly into her eyes, "do you not know that the task would become a pleasure if it were done at your request?"

She shook her head, smilingly, as she answered, "Well, Godfrey, I will have faith in your friendship. Having so little to lose—perhaps, makes me cowardly about losing that little—now, don't answer me that does not apply to you. And as to your present wish, 'tis the easiest thing in the world. You cannot suppose that so beautiful a creature as Edith has finished her third season without learning her own charms. It will only seem to her a very natural and necessary little bit of homage on your part."

"Ah," said he, with a sigh, "pity that she has been out three seasons!"

Mrs. Dalton fixed her eyes on him for a moment with an expression of restrained mirth. Then compressing her lips, and keeping silence with an effort, she darted from the room to commence the important business of the toilette.—“Simpleton that I am!” said she, chidingly, to herself, as her maid looped up her dress with geranium and myrtle, and fastened the blossoms among her profuse ringlets. “I had nearly marred my own scheme at its very commencement by a little outbreak of jealous vanity. So irrational! To pick out a wife for Godfrey, and then begin to be angry because he overlooks me in his admiration of her! Absurd! Well, I only hope he will not be too precipitate. Edith is not a woman likely to dispense with the wooing which is our sex's privilege. We have a full month before us, I shall be quite satisfied if, by the end of that time, he comes to the point. And then—I shall go down to Beechwood for the winter.”

And a sombre expression stole into her large dark eyes, and a gradual languor seemed to unstring her graceful limbs. Few who had beheld the apathy with which she submitted to the adornments which her silent attendant lavished upon her, would have believed that her face was capable of such sparkling animation—her manner of such vivacious coquetry. But when the last curl had been arranged, and the last bouquet fastened, she passed her hand over her forehead, and, with a sudden expression of contempt, whether for herself or for the subject of her meditations we cannot say, she resumed, as with an effort, her ordinary demeanour, and descended to the drawing-room.—Beechwood was her home.

Shall we inquire into Edith's thoughts during the same half-hour? No. Time will develop them. At dinner she was a little surprised to see Mr. Thornton the life and leader of the party, but she felt strangely interested by the idea that, under all this sparkling vivacity, there was a concealed melancholy of temperament, known, in all probability, only to herself and to his cousin. The latter appeared fully to understand the art of drawing him out, and under her judicious management he scattered repartees, puns, and illustrations, with a prodigality perfectly astonishing. Edith was at some distance from him, and fully occupied in listening; she was thankful to be seated between a fat squire and a taciturn curate, neither of whom endeavoured to divert her attention. The style of Mr. Thornton's conversation was perfectly new to her, and she enjoyed it not a little. Nothing seemed to come amiss to him; no subject was evaded, no remark unanswered. From theology down to gourmandism, from politics to pic-nics—wherever the conversation-ball glanced, there was he ready to catch and to return it with untiring vigour. If he had no argument at hand, he had a smile; and if that failed him, he supplied its place by a jest. Nothing was too deep or too shallow, too high or too low, but his wit could touch, or his fancy embellish it. She had no time to analyze, even if she had been capable of doing so,—she could only admire. And a strange kind of feeling came upon her as she walked meditatively back to the drawing-room, as though all deep thought and laborious study were but waste of time, and there was no topic which could not be fully discussed and satisfactorily settled in a conversation. Strange, also, it seemed, that some of the topics should be handled at all; stranger still, that one who could handle them so delicately should not have shrunk from exercising his skill in public. But of this she had neither leisure nor inclination to think at any length. She was entertained, interested, fascinated; she had experienced a new sensation.

(To be continued.)

SNOW-SHOES.

It is interesting to notice the skill and contrivance with which man adapts himself to the different climates and physical peculiarities of the countries in which Providence has assigned him a dwelling. Places, which to us would seem utterly desolate, are not only rendered habitable, but are made to afford many of the pleasures and even luxuries of life. Natural difficulties are overcome with a readiness in the application of means which may well excite our admiration and esteem. In the chilly regions of the north, where the cold is too intense for the growth even of the rugged pine,—where, during a large portion of the year, the waters are bound up with frost, and the earth is hidden beneath deep snow, the Esquimaux uses both the ice and the snow in the construction of a dwelling, which he finds warm and comfortable, while the external air is often more than fifty degrees below zero. When the hunting grounds of the Indian are hidden beneath the same glittering mantle, on which we should suppose a foot heavier than that of a bird would find it impossible to tread with safety, the hunter and the traveller nevertheless fearlessly pursue their way by means of one of those skilful contrivances alluded to above. Experience has taught him that, by enlarging the surface of his foot, the slight cohesion among the particles of the snow beneath him is sufficient to support his body; and, accordingly, he supplies himself with a pair of snow-shoes, with which he steps fearlessly forward over drifts which, without such aid, would prove fatal to him.

The snow-shoe in common use in the North American continent consists of two light bars of wood fastened together at their extremities, and bowed outwards by means of transverse bars inserted between them. The side bars are first brought into shape by means of a frame, and are dried before a fire. The front part of the shoe turns up like the prow of a boat, and the part behind terminates in an acute angle. The spaces between the bars are filled up with a fine netting of leathern thongs, except that part behind the main bar, which is occupied by the foot; the netting is there close and strong, and the foot is attached to the main bar by straps passing round the heel, but only fixing the toes, so that the heel rises after each step, and the tail of the shoe is dragged on the snow. Between the main bar and another in front of it, a small space is left, permitting the toes to descend a little in the act of raising the heel to make the step forward, which prevents their extremities from chafing. The length of a snow-shoe is from four to six feet, and the breadth one foot and a half to one and three quarters, being adapted to the size of the wearer. The motion in walking in them is perfectly natural, for one shoe is level with the snow, when the edge of the other is passing over it. It is not easy to use snow-shoes among bushes without frequent overthrows, or to rise afterwards without help. Each shoe weighs about two pounds. The northern Indian shoes differ a little from those of the southern Indians, having a greater curvature on the outside of each shoe; one advantage of which is, that when the foot rises, the overbalanced side descends and throws off the snow. All the superiority of European art has been unable to improve the native contrivance of this useful machine.¹

It is not difficult to walk in snow-shoes, but one unaccustomed to their use is sure to suffer severely from a violent inflammation and swelling of the instep and ankles, called by the Canadians *mal à raquette*. This disease seldom excites compassion in the more experienced travellers, who push on as fast as they can, regardless of the pain of the sufferer.

Snow-shoes are apt to get clogged, especially in frosty weather, rendering frequent halts necessary, in order

(1) Franklin's first journey to the shores of the Polar Sea.

to get rid of the incumbrance. When there is water under the snow, and the cold is severe, large lumps of ice form on the snow-shoes, and the foot at every step seems as if it were chained to the ground.

In travelling to any considerable distance over snowy regions, the party must, of course, carry with them sufficient provisions for the whole journey. These are generally conveyed on dog-sledges, made of two or three flat boards, curving upwards in front, and fastened together by transverse pieces of wood above. They are so thin, that if heavily laden, they bend with the inequalities of the surface over which they pass. The ordinary dog-sledges are eight or ten feet long, and very narrow, but the lading is secured to a lacing round the edges. The weight usually placed upon a sledge drawn by three dogs at the commencement of a journey, is not less than three hundred pounds, which, however, suffers a daily diminution from the consumption of provisions. The sledge itself weighs about thirty pounds. When the snow is hard frozen, or the track well trodden, the rate of travelling is about two and a half miles an hour, including rests, or about fifteen miles a-day. If the snow is loose, the speed is, of course, much less, and the fatigue greater.

The general dress of the winter traveller is a *capot*, with a hood to put up under the fur cap in windy weather, or in the woods to keep the snow from the neck. The trowsers are of leather; and the feet are protected by mocassins of ox-hide, or, still better, of the skin of the deer. The very best are of the hide of the moose deer, but this substance is very scarce. The foot is first wrapped in a piece of blanket, cut for the purpose, and then thrust into the mocassin, which is fastened by thongs of soft leather passing round the ankles. The upper part of the mocassin is composed of loose flaps which are passed under the stocking, which reaches no lower than the ankle; by this contrivance the snow is kept out, and the foot is made warm and comfortable. The traveller's costume is completed by a blanket or leathern coat, secured by a belt round the waist, from which hang his fire-bag, knife, and hatchet.

Captain Head has given a lively description of a journey in Canada, in the depth of winter, when the snow was lying deep on the ground. The district was a wild one, without roads or even a track; the ground was too rough, and the snow too deep for a sleigh; and the party chose the frozen surface of a river as the smoothest path. They marched in single file, moving heavily along upon their snow-shoes, seldom speaking, except at the end of every half hour the foremost of the party yielded his place to one of the rest; the duty of the leader being the most laborious, he having to open a path for the others. During the day, a snow-storm had been threatening: "Still, however, we went on, and it grew darker and darker, till a heavy fall of snow, driven by a powerful wind, came sweeping along the desert track, directly in our teeth; so that, what with general fatigue, and the unaccustomed position of the body in the snow-shoes, I could hardly bear up and stand against it. The dreary howling of the tempest over the wide waste of snow rendered the scene even still more desolate; and with the unmitigated prospect before us of cold and hunger, our party plodded on in sullen silence, each, in his own mind, well aware that it was utterly impracticable to reach that night the place of our destination.

"But, in spite of every obstacle, the strength of the two Canadians was astonishing; with bodies bent forward, and leaning on their collar, on they marched, drawing the toboggans after them with a firm, indefatigable step; and we had all walked a little more than seven hours, when the snow-storm had increased to such a pitch of violence, that it seemed impossible for any human creature to withstand it,—it bid defiance even to their most extraordinary exertions. The wind

now blew a hurricane. We were unable to see each other at a greater distance than ten yards, and the drift gave an appearance to the surface of the snow we were passing over, like that of an agitated sea. We wheeled round every now and then by the wind, we were enveloped in clouds so dense, that a strong sense of suffocation was absolutely produced." The party, therefore, halted, and sought the friendly shelter of a pine forest, where they levelled a maple-tree, and having gathered some large pieces of bark, proceeded to shovel away the snow from a square spot of ground. "The fibrous bark of the white cedar, previously rubbed to powder between the hands, was ignited, and blowing upon this, a flame was produced. This being fed, first by the silky peelings of the birch bark, and then by the bark itself, the oily and pitchy matter burst forth into full action, and a splendid fire raised its flames and smoke amidst a pile of huge logs, to which one and all of us were constantly and eagerly contributing."

The place of encampment is usually called the *hut*, and as soon as the snow has been cleared away, is usually covered with pine branches, over which the party spread their blankets and coats, and sleep in warmth and comfort, by keeping a good fire at their feet, without any other canopy than the sky, even though the thermometer should be far below zero.

"The arrival at the place of encampment," says Franklin, "gives immediate occupation to every one of the party, and it is not until the sleeping place has been arranged, and a sufficiency of wood collected as fuel for the night, that the fire is allowed to be kindled. The dogs alone remain inactive during this busy scene, being kept harnessed to their burdens until the men have leisure to unpack the sledges, and hang upon the trees every article of provision out of the reach of these rapacious animals."

Similar in its uses to the snow-shoe is the snow-skate of the Norwegian, and is, indeed, a far more powerful and efficient machine. The *skies*, or snow skates, consist of two thin, narrow pieces of fir, of unequal lengths, and turned up in front. The longer skate, which measures about seven feet, is used on the left foot; the other, which is about two feet shorter, on the right. The width is about three inches, and the thickness at the part where the foot is placed, about an inch. Strong loops of willow, or of fir root, are fixed to the sides, through which are passed the leather thongs for attaching the skate to the foot. The skates are smeared with pitch, and on the under side is a hollow groove to prevent slipping. The under side is also covered with seal-skin or rough bear-hide, for the same purpose.

During the wars between Sweden and Norway, two regiments were trained to the use of those skates, and were called *Skidbäre*, or skate-runners. Those two battalions consisted of about six hundred men, and were drilled during winter. Their rifles were slung, and each man carried a staff, flattened at the end, to prevent it from sinking in the snow, and to assist him in leaping over such obstacles as stood in the way. They descended hills with wonderful rapidity; and in drawing up, they left room between the files to turn in the skates, which they did by changing the right foot by an extraordinary motion which would seem to dislocate the ankle. "An army would be completely in the power of even a handful of these troops, which, stopped by no obstacle, and swift as the wind, might attack it on all points; while the depth of the snow, and the nature of the country, would not only make any pursuit impossible, but almost deprive them of the means of defence, the *Skidbäre*, still hovering round them like swallows, skimming the icy surface and dealing destruction upon their helpless adversaries."

The skates are still in common use in Norway; the widely-dispersed inhabitants, without distinction of age or sex, making use of them in winter; traversing mountains, lakes, and arms of the sea, as well as level ground, and often saving several leagues of the dis-

(1) A small hand sledge for carrying provisions.

tance they are obliged to travel at other seasons. On a common road, a good skater will travel faster than a horse in a sledge. His progress up hill, however, is slow and fatiguing, and on hard snow he would slip backwards but for the rough skin on the under surface of the skates. But he descends the steepest mountains with astonishing rapidity, avoiding precipices, and guiding his flight with his pole. It is said that considerable skill and practice are required to become a good snow-skater.

A SKETCH OF DOMESTIC LIFE.

CHAP. VII.—CHRISTIAN FEELINGS.

"You know as well as I do the unsettled state of the neighbouring country," said the young clergyman, after a pause, as he leaned against his father's writing-desk. "The consequences are, lawlessness, bloodshed, and the destruction of all civil and domestic rights, under the guise of liberty and justice."

"I know—I know," answered Danielis. "But go on; why this strange introduction to the matter on which you are about to speak?"

Jacob continued, "The worst of all appears to me to be the want of religious and moral feeling. The machine of state is soon put right; but social virtues are not so easily restored. For months there has been no public worship; the clergy have fled, or been driven away for their political opinions, and the schools are empty."

"I almost fancy you wish to become a missionary to the disturbed districts; is it really so?"

"Yes," answered Jacob. "A request has been sent to me in the name of several parishes; they wish me to try to restore the worship of God. Children are unbaptized, marriage rites not celebrated, the sick and the dying in vain long for religious consolation, and the services of the church are quite neglected. My own lot, in the midst of civil war and dissensions, will be most unsafe. Not even one parish, not a regular stipend is secured to me, the whole country is so unsettled."

"And what answer did you give?"

"That I would do nothing without your advice."

"And that advice, my dear son, is that you should not quit your own country, to which your services are due."

"But, father, is not the whole world our country, created by the hand of God? Is not every one our neighbour whom we are commanded to love as ourselves?"

"Right, my dear child; but I imagined that the neighbourhood of your parents, the opportunities you enjoy of association with the friends of your youth, would bind you to your home with links of iron; and that even an affair of the heart would make it difficult for you to tear yourself away, and risk your life and happiness in a foreign land."

As the Elder said this, Jacob cast down his eyes; conscious what his father alluded to, he hesitatingly replied, "Yes, very difficult; but the greater the sacrifice, the more acceptable is it in the eyes of God."

"You have well said," answered Danielis, to whom the blushes and hesitation of his son revealed the secret of the young man's heart, and one cause of his departure. After a long pause, the Elder, to give a fresh turn to the conversation, continued—

"But, my son, reflect a little; you are still so young; here you have every thing necessary for the improvement of your mind; the judgment of enlightened persons must have a favourable influence on your preaching; and the duties of the pulpit are the most

important functions of a clergyman. It is a difficult office. Eloquence is not alone a gift of nature, but requires study. I fear that in the country, among rude, ignorant people, you will neglect this and become an every-day preacher, who performs his duties mechanically, and thinks only of his own advantage."

"Dear father, he who is not inspired by his divine calling will receive inspiration from neither town nor village. It seems to me that not less art and study are required to elevate to holy things the mind of a peasant than that of a dweller in towns."

"That may be true, Jacob. But are you indifferent to leaving your present circle, where you can do so much good, for an unknown and circumscribed district?"

"That does not alarm me. Man's activity and goodness depend not on the extent of his sphere of action. His own will, strength, and deeds, create the region of his operation."

The assenting nod of the Elder seemed to approve of his son's opinions, but he added: "Although there are two sides to every subject, pray bear in mind, that, to do much good, it is needful to think of one's self and one's circumstances. Independence is a necessity to a man whose wishes tend to universal benevolence. He who is needy, and requires help himself, can do little to aid others, and only builds castles in the air. Even Archimedes required a firm support for his feet before he engaged to raise the earth with his lever; and a moderate independence and good position in society, whether earned by our exertions or the result of our calling, alone give us this support."

The expression of the young man's face showed that he did not quite comprehend his father's observations, or thought them unsuitable to the subject. He replied in an absent manner, "Undoubtedly."

"Well," continued the Elder, "you are at present in an enviable situation, with good prospects for the future. In a few years, you will have a profitable living, which will secure you from want for life. Poverty is the bitterest of all cares, because the most contemptible, and yet the most pressing of our sufferings. When you have left your parish, as you desire, to devote yourself to the service of others, you will soon be forgotten, and on your return those who have not quitted the service of your church will be preferred to you. I allow the pressing need of our revolutionary neighbours; they want honest and active pastors; but from their own unsettled state, they cannot secure to you either a provision for life or even daily bread. Consider well, my dear boy, and when you take a loving partner for life, as you most likely will, think how you are to support her."

The countenance of Jacob became crimson, but his was not the blush of shame, but was the glow of inspiration. Earthly love might have mingled with his feelings, but it soon subsided, and religious enthusiasm alone remained. He raised his eyes to heaven, then walked up to his father, and seizing his two hands said, in a tone of voice which seemed to crave forgiveness for the warmth of his language:

"Dear father, I know you well, your love and your principles. If one of the apostles had come to his Heavenly Master, as I have come to you, would he have received the like answer?"

The Elder was silent. He looked for some time at his son with much surprise, and then said with deep kindness and affection,

"If this is your way of thinking, my dear Jacob, I can have nothing to say against it. Go, fulfil your duty as your conscience bids you; God will be with you. Even should your Christian feeling lead you into earthly sorrow, it will ensure you a glorious resurrection and a throne in heaven. Go, my son, and may God bless you."

The father pressed his son to his breast with emotion, and the moistened eyes of the young man showed how deeply he felt.

CHAP. VIII.—SELF-DENIAL.

The mother consented to Jacob's departure, though with a heavy heart. She felt much for poor Else, who, in various ways, heard many words which informed her of Jacob's resolves, although it was never openly discussed. The news seemed to fall like a sentence of death upon her quiet and silent happiness. She could not oppose her lover's departure, and even had she dared, she would have died rather than have betrayed feelings which she could scarcely understand herself. She carefully avoided a meeting with Jacob, towards whom her whole being felt attracted by the unseen influence of love. If obliged to address him in his parents' presence, she spoke calmly, and yet she felt as though her soul was longing to pour itself out in affectionate words. And when by chance her eyes turned upon him, their expression was one of complaint and gentle reproach, to which he answered by looks of love, consolation, and hope.

But what the young lovers succeeded in concealing from every one else, almost from each other, did not escape the penetration of Mother Anna, and she felt the secret sorrow of Jacob and Else, even more than her own. One day when alone with her son, she said to him,

"Your departure grieves me much, my dear boy. I feel that I shall seldom see you; the path of danger you have chosen, and the sacrifice you make of home, of your living, and of your prospects, contribute to my sadness; but I trust in God. I confess to you, that for one reason only do I rejoice at your plan,—it may restore peace to Else and to you. Your presence is destructive to her quiet, and her welfare, as well as yours, lies near my heart. For this cause and no other, I can bear you wandering in a strange land. Else is little more than a child; her affection is a dream, from which you must not awaken her, if you love her truly. Go, my child, be wise and happy. To persist in wishes we cannot gratify, is wrong. Go, and God be with you! Forget every thing except yourself, and the reward of your own good conscience."

Jacob looked fondly at his mother, and took her hand in his, as he replied, "Dear mother, you cannot be serious. Must I forget my mother, my father, and Else? No, I must first forget myself. While memory endures, you three will be there enshrined. But calm your uneasiness. Because I love innocence and holiness, I must love this dear girl, who is so pure from all guile. Whether she will ever be my wife, I know not; but she will occupy my thoughts during my whole life. Do not think me a coward who can lose his reason in a Werther fever. I love with open eyes; therefore, the happiness of this noble girl is dearer than my own. If a worthier than I were to offer his hand, and he could make Else happier than myself, I would lead her to him, though with a bleeding heart."

The mother embraced her son with tender love. At last the parting hour arrived. Parents, brothers, and sisters, uttered a tender farewell, whispering hope and courage. But Else stood at the door of the house, timid and shrinking from view. Jacob extended his hand as he passed her,—their eyes met; his, full of love, made a tender and mute appeal: the answer was a tear. Else fled away to her own room, while the young pastor hastened through the garden to the highroad.

Jacob now entered on the path he had chosen, in the midst of confusion and party strife. He visited his father's house at very rare intervals; but his letters gave proof of an energetic spirit, which rose above all trouble. He had chosen for his head-quarters a little village, from whence he diverged, and performed his clerical duties to the desolate community. On Sundays he preached three or four times a day, sometimes at one place, sometimes at another; a conveyance being in waiting to convey him to the different churches. During the week the young preacher walked cheerfully

from village to village, giving good advice, praying with the dying, celebrating marriages, and re-establishing schools. Denying himself every comfort, his home was a deserted, half-empty house, barely furnished, but provided with arms against any surprise. His daily intercourse was with a wild, ignorant people; he even accompanied them to battle to give aid, spiritual and temporal, to the wounded.

Yet all these privations could not drive the young man from the path in which he trod without fanaticism, though with all the zeal of a fanatic, and in which he persevered without hope of reward, exposed to the taunts and reproaches of his acquaintances. Even Danielis did not escape censure from those who think that in providing for their children comfortably and well without consulting the will of God, they have fulfilled their highest duty. The Elder was not affected by their reprehensions, nor hurt by their offensive expressions and forebodings of ill. "Be it so," he would say to his wife; "the unjust reproaches of man bring the favour of God. What my son is now doing, was done by the noblest of men in olden times; and though their meed was death, from the barbarity of the age in which they lived, yet now they are revered as martyrs and saints. Let our Jacob pursue his path as a messenger of peace and an apostle of the Gospel, following in the rear of his predecessors, the benefactors of mankind."

CHAP. IX.—THE FESTIVE MEETING.

A year passed away,—a year rich in blossoms and harvests—like every other that we welcome so warmly, and so coldly see depart. Nature's creating hand, as if wearied with daily toil, sought repose on its wintry bed; and the snow-flakes fell like dreams upon its resting place, while the hoarfrost, melted by the pale sun-beams, was dissolved from the branches of the trees.

Christmas, the pleasantest of the domestic feasts in the Elder's family, drew near. All the household were busy preparing their gifts in secret. Such hiding and seeking, such counselling and guessing, such jests and whispers, were never seen or heard, as the memorable day approached. On Christmas-eve every one delivered his or her gifts to the parents, to be deposited on the table under the mysterious folds of a white cloth. All then left the room, that the presents so carefully concealed might be duly arranged by the father and mother.

The night seemed interminable to the impatient members of the family. Before dawn, the father lighted the numerous wax-lights on all the tables, and in the branches of the Christmas tree, and then went in search of the eager troop, who were assembled in Else's chamber. Full of expectation, they walked in couples to the festive hall, where they gave vent to their pleasure, surprise, and admiration, in loud and joyous exclamations. Jacob, alone, was absent. Every one missed him, wished for him, and pitied him for being so far away from the happy scene. All spoke of him, all left their own pleasure diminished, since it could not be shared with him. Else, alone, was silent; but a deeper sorrow than even theirs oppressed her heart, and she would willingly have given vent to her feelings in tears. He whom she loved more and more each day, as she appreciated his self-devotion, he was not there; his place was vacant,—there was no gift for him.

But a few hours passed, and the regret of all was changed into gladness. A letter came from Jacob announcing his return home that evening. A friend had undertaken his duties, and with a mind free from care, he was coming home to fulfil his heart's dearest wish. "He could not," he said, "relinquish the pleasure of celebrating with the beloved household a day which had ever been to him the most solemn and the most esteemed in all the days of the year."

"But for heaven's sake," exclaimed Mother Anna, as

soon as she was alone with her husband, and free from the noisy mirth of the family; "how can we make this a happy day to dear Jacob? We have no festive gift for him. Advise me what to do. I can offer him sweetmeats; but what a trifle—what a poor acknowledgment of the joy his return gives us,—his safe return this dreary winter weather! Or would you place some money among my sweets? he may want it, poor fellow."

Danielis shook his head, as he answered, "Money! that is dry nourishment for heart and spirit, though useful for corporeal wants and necessities. Let us think of a nobler gift; he deserves it! He has made a sacrifice to the highest of duties, and has resigned the most easy and pleasant life, one that all would desire, for a gloomy existence, surrounded by troubles and dangers. He may sink under it. No one, except God and his own conscience, can reward him as he merits; but let us now gratify the strongest of his earthly wishes. Come, I have a happy thought." He whispered something to his wife with a smile.

Mother Anna at first looked at him doubtfully, as if quite alarmed; but the expression of her features soon changed, and her face beamed with a joy which lighted up her whole countenance.

"It is a charming idea," exclaimed she; "but how shall we gain time? for evening will quickly be here, and great preparations will be needful. Where shall I find flowers? and an invitation must be sent to all our relatives. As to the feast, there will be plenty of good things, for I am always prepared on a day like this. Then, the goldsmith—I must go into the town myself. No! I can send. But there is no time to be lost; evening is at hand. Go, my dear husband; and do your part."

Mother Anna set to work so eagerly that she put all the house in motion; but no one could guess the reason of these extraordinary preparations. One messenger was sent to the town; another to the wood; a third to invite the guests; a fourth to the goldsmith and the jeweller. There happened to be a young cousin on a visit at the Elder's to whom Mother Anna confided the secret, and whom she chose as her assistant; and when evening came, and the happy Jacob arrived, and had embraced his parents, brothers, and sisters, all was prepared to make the holy day a most happy one for him.

Much time was spent, as may be well imagined, in questions, answers, caresses, and rejoicings over the newly-arrived guest. At length the father made his way through the joyful family group, and raised his voice above the rest for silence. He took Jacob's hand, and said:—

"To business, my children, to business! before we sit down to supper. Our young missionary has not left his post to-day in vain. He expects his Christmas gift. Ah! poor Jacob, you were too late to share with the others. But it would grieve your mother's heart to leave you uncared for at this happy time. Come, mother, lead the way into your drawing-room, and we will follow. Now, young people, after us," cried the father, smiling merrily at his flock.

No sooner said than done. The family entered Mother Anna's saloon, which was gaily lighted up. The walls were covered with oil-paintings and engravings; with portraits of her children and relatives, or memorials of friends; for to walk in loving remembrance among those dear to her, the dead as well as the living, was the sweetest of her quiet domestic feelings. At one end of the room, near a sofa, stood a table adorned with confectionary of all sorts. To this table the father and mother led their son. Both watched his looks, smiling, and enjoying his surprise. Jacob embraced them both, exclaiming:—

"How affectionate, how good you are to me!"

"Affectionate, certainly," repeated the Elder; "but good!—no, Jacob. This table, so trifling a gift, contradicts your assertion. However, I can, should you

wish it, add something to these nothings. It is a jewel which many will covet, and yet many will reproach you for taking it. Reflect before accepting it, for if you do so, you must keep it for ever. It is not mine, yet I can give it to you. It costs me nothing, yet it will cause you much expense, which expense may increase yearly. It delights all who look upon it, and I confess it charms me by something magical in its form and colour. But in a few years the gold frame will tarnish, and then the worth or the worthlessness of the jewel will be discovered. Dear Jacob, look not so astounded, even though I speak in riddles. This jewel is itself an enigma, to which time alone can give you a clue. Yet, I feel certain, that the more anxiety it costs to obtain, the greater happiness will it bestow on you. But why say more? Come, my son, see it with your own eyes, and then decide."

While the elder thus spoke, the whole family stood around him in a circle, listening with much curiosity. Danielis opened the door of an adjoining room, and exclaimed, "Follow me!"

There, beneath the flower-garlands and ivy branches which adorned the chamber, more beautiful in her simple white robe than if glittering with jewels,—sat Else; her head bowed down, and her hands clasped in deep anxiety. The whole household looked on amazed; then followed a deep silence. Jacob stood as though petrified with wonder; but joy and ecstasy flashed from his eyes. He stretched forth his arms to his beloved; Else rose, trembling, and sank fainting with happiness upon his faithful breast.

The father and mother looked on with joyful tears, and the rest soon found their tongues in affectionate congratulations to the young lovers, who threw themselves into their parents' arms.

Scarcely a year from this joyful betrothal, the marriage of Jacob and Else was celebrated. The Elder and his wife live their own young days over again in witnessing this happy union; and every coming year adds to the bliss of the pastor and his beloved Else.—D.M.M.

MY FIRST VISIT TO COURT,

DESCRIBED IN A LETTER TO A FRIEND.

From the German of Starke.

[Gottlieb Wilhelm Christoph Starke, Protestant minister of Ballenstedt, is the author of five small volumes, entitled "Gemälde aus dem häuslichen Leben und Erzählungen" (*Pictures illustrative of Domestic Life, and Tales*). The simple beauty, purity, fidelity, and quiet humour of these sketches are very charming; and although these qualities cannot be entirely preserved in a translation, yet it is hoped that the specimens we are about to submit to the reader will convey a favourable idea of an author who is almost entirely unknown in this country.]

FIVE wearisome hours have I to describe to you, my dear friend—five hours full of that sort of anguish which we may suppose a fish out of water to endure. I feel as much relieved as a man that has just paid off a heavy debt; for, since the occurrence of the vexatious events of yesterday, I have enjoyed a night of undisturbed repose. O magic sleep! how beautifully dost thou render rough things smooth, dark things bright! how sweetly dost thou restore troubled spirits to their accustomed rest, and obliterate the traces of all past grievances, except those that arise from a troubled conscience! Again we stand like a healthy tree after a storm, look back upon past adventures, relate them, and laugh at them as at a dream of the night.

You have long been aware of my sincere regard for worthy farmer Kronow, of Torneburg, and the delight with which I participate in the simple pleasures of his house. His little estate lies opposite to the town. A

smiling prospect is seen from the upper windows of the house, well-fed cattle abound in the yard, and numerous signs of rural industry are scattered every where around.

My journey hither the day before yesterday was delightful, and still more so the conversation I had with my friends on my arrival, accompanied as it was with the prospect of a week's unrestrained enjoyment beneath their hospitable roof. But, as the farmer rightly says, "thistles spring up among the finest wheat," so from one rosy week I must subtract five thorny hours, and these I am about to describe to you.

Yesterday morning the secretary of the prince called upon my friend, to speak with him, in the name of his master, concerning the measurement of some land. When that business was concluded, the polite gentleman turned to me, addressed me by name, (for he had already heard of me and my village,) and inquired if he had the honour of speaking to the author of the moral tales and the work on education. "The prince knows you, and has more than once mentioned you in terms of admiration," said he, in reply to my affirmative answer to his question; and then, after many friendly assurances, he departed.

Directly after dinner I received a short note from him, stating that he had told the prince of my being here, that his royal highness expressed a wish to make my acquaintance, and if I would be at the castle by three o'clock, the sentinel would conduct me to his (the secretary's) room, and he would introduce me to the prince. There was not much more than an hour left for me to dress, and to think over the part which I had to perform. I felt very anxious to support my literary character with dignity, and at the same time to converse with the freedom and familiarity of a private gentleman. That the prince would speak of my writings was certain. I therefore thought over a number of important subjects, from which I drilled a whole regiment of ideas, which I proposed to pass in review before the prince as an entertainment worthy of the kind attention he had showed me. My toilet was finished before my ideas were satisfactorily arranged, and I set out more sleek, well brushed, and whitely powdered, than I had been for a long time, while the farmer's eldest son, who accompanied me to the castle, could scarcely keep up with my rapid strides.

When we arrived at the castle gate, the friendly boy left me, and I received a somewhat energetic challenge from the sentinel as to who I was and what I wanted. I requested to be conducted to the secretary. Unimportant as this interruption was, yet it made me painfully conscious that I was out of my proper sphere, in which, being known to every one, I could come and go without being questioned. On this account I felt less at ease with the secretary, and more at a loss for words than I was in the forenoon. The man sat buried in papers, and hastily told me to follow him into an adjoining room, where I should find two distinguished gentlemen, whom he named to me, and with whom I should pass my time most agreeably until the prince was ready to speak with me, which would be before the concert, in about an hour's time. With this he sprang hastily before me, opened the door of the apartment, and closed it with equal haste when I had entered. The magnificence of the walls and the ceiling, the multitude of ornaments, and the splendour of the furniture, bewildered me, so that I could observe nothing quietly; while the torrent of words which the two gentlemen poured forth, one after the other, and sometimes both together, upon me, exposed me between two fires of politeness, which I could return only by a mute and somewhat bashful succession of bows. To add to my perplexity, I had entirely forgotten their long, and, to my ears, most unfamiliar titles; and fearing to offend by addressing a cold *Sir* to each of them, I became more and more embarrassed and helpless.

Oh, that all those who move in high and splendid stations had enough of charity and knowledge of man-

kind not to despise at once those persons in the middle ranks of life who may chance to be torn from their station, and placed for a few hours in their company, even though they do conduct themselves tediously and awkwardly. At home, and among their own affairs, they are probably active and intelligent, conversational, and pleasing; while, in a new order of things, they would know as little how to conduct themselves as would the most accomplished courtier if he were suddenly transported from a German castle into the palace of the Emperor of China. Some such thoughts as these passed confusedly through my head as I stood before these two gentlemen; but my thoughts did not help to restore my composure, for I judged, perhaps unjustly, that they were not likely to bear this in mind. Their coolness and my warmth, their composure and my agitation, formed so striking a contrast, that I became more and more silent and disheartened. Twice did I attempt to collect my scattered thoughts, but failed. All that I said, even that which I uttered with warmth, appeared to me constrained and empty, pointless and flat, because it was accompanied with the feeling of internal restraint; and so I lost all self-satisfaction, without which a man can seldom contribute to the satisfaction of others.

"Probably you admire beautiful prospects," said one of the two gentlemen, opening a window for me, and then turning away with indifference. With such a prospect before me, if I had only been left to myself for a single quarter of an hour, or, still better, had had you, my dear friend, by my side, I should have recovered my senses, and have been myself again. The prospect was too beautiful to leave me unmoved. Within the graceful curve of the distant horizon were included several towns, and many hamlets, with the territories peculiar to each. On one side were richly wooded hills; on the other, wide-spread pasture lands; and directly beneath me was the castle garden, taste fully and scientifically adorned, near which the broad river peacefully glided along, creeping artistically round a little wood, and finally, in one magnificent sweep, encircling the town. Then the numerous houses which so prettily dotted the landscape awakened a yet stronger sympathy within me, while the incessant changes in the degree of light which illumined it excited a slight feeling of pensiveness. Whilst one side of the landscape was glowing in the bright sunshine, the thick clouds of evening clothed the other side in obscurity; so that between the two resulted a most beautiful play of light and shade.

Full of inexpressible emotion, I turned my gaze into the room. The two gentlemen were standing near the door, conversing about the bas-reliefs which adorned it. It did not occur to me that those who were in the daily habit of seeing this prospect were not likely to fall into raptures at its beauty; but the excitement I was in, and perhaps also a secret wish to show by my conversation that I really was a man of some feeling, drew from me a speech, which I felt almost before I had uttered it to be inflated and cold. "Truly," exclaimed I, "when such a glorious landscape does not seize the imagination and captivate the senses, man must be destitute of mind or of feeling, and as such worthy of pity!" One of the gentlemen looked up at me oddly, with eyes full of curiosity, waiting to hear something more, equally extravagant; the other laughed; and I stood rebuffed and terrified, like a child who has just broken a glass. "That was stupid," thought I, and I felt as if I would say as much. I stammered out something by way of limitation to my sweeping condemnation, which, as far as I can remember, did not much mend it; and I now felt so thoroughly abashed, that I did not even look again upon the rich landscape, whereby, as it afterwards occurred to me, the gentlemen must have thought that my sentimentality had very soon evaporated.

Nevertheless, they gave themselves some trouble to

make the conversation general: they asked me about this one and that one, and what must have been quite indifferent to them, about my station, my place of abode, my acquaintance, &c. My replies were very unready, and but little to the purpose. At one time I so far forgot myself as to speak of one of my neighbour's affairs with as much zeal and particularity as if the man had been their cousin. I then remembered that I was getting too discursive, and directly after my talk was, on the other hand, too restrained. In short, every moment I was forgetting the position I was in; my mind led me from the company of strangers into that of old acquaintance—from the castle to my own village. To maintain a discourse was therefore impossible. "These gentlemen were not made for me!" thought I; but now I see how unjust I was, for it might also have occurred to them, "The man was not made for us!" and if they did think so, they thought right. Our intercourse now became monosyllabic, and it was evidently kept up only to prevent yawning. One of them stood before a picture; the other walked slowly up and down, with his hands folded behind him, or pulled now and then at his neckcloth, or adjusted his shirt-frill; while I, with inward misgiving, looked towards the sky, which was becoming more and more clouded, and longed to be again at Kronow's cottage.

When we fail to make acquaintance with a man by attempting to exchange thoughts and feelings, we may often succeed by means of a pinch of snuff. So seemed to think the walking gentleman, for he suddenly stopped and held out his snuff-box to me. I declined with a bow. "But it is very unseemly in me," thought I, "to slight his kind offer," so lifted up my hand to take a pinch. He had withdrawn the box, but politely held it out again. My hand was already lowered, and I gave a second declining bow, but, as before, extended my hand a second time to take a pinch at the very moment that he withdrew his. He tried it again, and so did I, but the attempt failed; and there arose between us a most extraordinary seesawing of hands—a suitable image of our whole interview, in which ignorance on the one side to give was met by equal ignorance on the other side to take.

In truth, I did not succeed in taking; for, during our attempts, the door suddenly opened, and a servant entered to conduct me to the prince. I felt like a young man who is just going to deliver his maiden speech. I followed the servant through several rooms and halls, my heart beating violently; but, at the same time, I was collecting all my resolution to be calm, in order that my presence of mind might control my feelings. And, perhaps, all might yet have gone well, for the noble yet kind expression of the prince's countenance filled me at once with confidence and esteem, had it not been that, on entering his highness's apartment, the highly polished floor caused my foot to slip, and I nearly fell down. "Take care," said he kindly, "the floor is slippery." And here unfortunately my resolution not to express what was uppermost in my mind gave way. "Please your highness," said I, "it is indeed slippery at court." "That may be," returned he, "but it is not my fault: I have not made it so smooth." This answer, which made me feel how indecorous my remark had been, threw me at once into the condition of a confused orator, and made me as dull and awkward in this room as I had been in the other.

"You have written some excellent books," began the prince anew.

"Yes!" said I.

The prince smiled.

"I am stupid already at the beginning," thought I—I felt that I only meant that I had written some books—not that they were excellent. Awkward, very awkward is it, to hear a remark to which you must give both yes and no in the same answer. All my self-possession was gone—it was of no avail to attempt to recover myself—I must remain a passive sufferer. The

regiment of ideas which I had so industriously, but so vainly drilled, was of no use to me. I had supposed that the prince would of course say something about my book on education: I was therefore prepared to add to his remarks a statement of my own experience as to the necessity of making better provision for the education of the poor, by the further distribution and general improved management of schools. But it was too bad—he did not honour my education book with one word, but merely asked whether I was not soon going to bring out something new. I now fell into the same error as I had committed with my former companions. I was either too discursive or too abrupt. I gave as minute a detail of my negotiations with my publisher, as if the prince had been a bookseller. I then bethought myself that such details were not decorous, and began to talk about my unpublished work in as familiar a manner as if the prince himself had fairly copied the manuscript from my hand.

My unsuitable expressions, my familiar address, my incoherent remarks, all that escaped from my lips only served to constrain me more and more. I glowed as if I stood before a furnace, and compressed my toes until they ached. My increasing perplexity and the distress of my situation were more and more apparent to the good-natured prince—his questions therefore became more simple and considerate, while the throbbing of my heart and the earnest desire for deliverance from this scene increased every moment.

At this juncture the secretary suddenly entered, approached his highness, and said something to him, of which I only understood the words, "just arrived." The prince made me a very friendly bow, and hastened away accompanied by the secretary. There stood I alone. I uttered a deep-drawn sigh, wiped the perspiration from my forehead, and began inwardly to lament my awkwardness. But why did I not then think as I now do, that after a few days all this would afford me amusement rather than vexation? That which causes a man pain and displeasure can often be looked back to as a subject for laughter. But I could not think so then; indeed, something within me seemed to whisper, that my adventures were not at an end. Alone and undecided, I looked round the large room, which echoed my footsteps, and knew not which way or where to go. I remembered the secretary to have told me, that directly after my interview with the prince I might go into the concert-room, where I might expect a great treat. But where, in this huge wide castle, was I to look for the concert-room?

I crept away on tip-toe, as if treading upon forbidden ground, and went whither chance conducted me. I passed through many rooms which I had not yet seen—entered many corridors which led I knew not whither: at one time I walked forwards—then turned back again—cruised about hither and thither—tried all four points of the compass—paused to consider, and became quite convinced that I had lost my way. Then I impatiently began my wanderings over again, and tried all the paths I had already given up as hopeless, until, without knowing it, I got into another wing of the castle; but when I discovered it, it did not help me. I had already knocked gently at many a door and tried many a handle—many a door had I opened in vain, when at length I gently put my head into a room, where my head was of all things the least expected. Two ladies' maids, as they appeared to be, stood busily occupied in adorning themselves. They both fled to one corner of the apartment, and I drew back equally startled, while one of the pair, a gaily dressed creature with roguish black eyes, sent after me an unrestrained volley of laughter.

This was the first time that I had been openly laughed at, and I retreated from it more quickly than a rogue before a police officer. In the hope of escaping at last from this labyrinth, I hastily entered a chamber through an open door, and thence into another chamber, and

here my progress was stayed, for it led no further. I stood in the midst of a bed-room, in which was an unmade bed and abundance of litter. My superlative ideas of the refinement and splendour of every thing in this castle were somewhat corrected by the ordinary appearance of this room. "Was I not a fool," thought I, "to entertain such undue veneration for every thing here, and thus to behave so timidly? Am I not here among men who go to bed and sleep—get up again and wash, in no better state than I; and some of whom use much dirtier linen?"

Whilst I was making these observations, the occupier of the room suddenly entered, and seeing a stranger there, started, and with a mistrustful and angry look, asked, "What are you doing in my room?"

I answered with a bow, "I am only looking for the concert-room."

"The concert-room, why that is in the other wing! No, sir! that excuse won't do."

I explained to him as well as I could, or rather as confusedly as possible, who I was and how I had lost my way. My dress, my respectable appearance, and my white leathern gloves, which I still wore, seemed at length to pacify him, and with a little less threatening air he pointed out the way I was to take. Confused at the awkwardness of the adventure, I left his room without feeling able to profit by his directions. This advice, which was to keep the little ball-room on my right, and then to go by the blue room on the left, was not of much use to a poor lost fellow, who was so little used to these things as not to know where the little ball room or the blue room might chance to be situated. "It is just the same," thought I, "in the castle as in the street—men have not sufficient perspicacity to give plain directions to a stranger." I was even going to be angry about it, but it occurred to me that on the subject of perspicacity I had not much that day to boast of. For my consolation I now caught sight of the secretary. He took me readily under his guidance, began to chat in the most friendly manner, and at length brought me to a door, at which I remembered I had already stood twice hesitating.

"Yes! yes!" said he, when I told him so; "a man often misses the right way by over-carefulness about it;" and so he conducted me into the concert-room.

Here I began to breathe freely, under the hope that enjoyment would supersede perplexity. But the gratification of my ears was not likely to allay my thirst, and my parched tongue began to remind me, that it would be pleasant to drink first and listen afterwards. "Only think that in such a splendid castle no one should offer me a cup of coffee!" mused I. "How refreshing would it be, especially with such milk as the farmer's cows yield—such as my kind hostess brings to me in the honeysuckle bower!" During these cogitations, I noticed a general stir among those about me. Suddenly the prince, the princess, and some members of the royal family appeared. I stepped a little forward, as I thought it my duty, to make a bow to the prince, but in my awkwardness I had well-nigh run over him. "Does the man want any thing?" said some of the attendants softly, yet so that I could hear it. I looked around me as if I had just awakened out of a dream. The people laughed and I returned, I knew not how, back again to my seat. "That was superlatively stupid!" thought I, rubbing my forehead full of anguish that I should again be such a bungler.

"Does the man want anything?" seemed to ring in my ears: but the really excellent music now began: all eyes were turned, not on me, as I had feared, but on the performers. The stillness and breathless attention of the audience were contrasted by the lively expressions of delight in the vicinity of the conductor. These, with the splendid decorations of the hall, diverted my attention, and helped to soothe my mind, and made me forget this last blunder sooner than I had done my former mishaps.

But twice, as the prince seemed to be looking somewhat steadily towards the place where I sat, it occurred to me that his highness was offended at my behaviour. Without considering that the prince was most probably thinking on far more important affairs, or if he thought on my strange behaviour at all, his easy politeness would readily forgive it, I reviewed the whole of my conduct, and could not conceive how I had come to be so excessively awkward. "Oh, that I could now recall the time that is past!" thought I, "I should succeed better." Greatly did I lament that I had lost so many favourable opportunities; the encomium of one might have been met with such and such an ingenious return; to the remark of another, I might have given this or that appropriate reply; on more than one occasion I could have put in this or that witty repartee; and had I been ready enough to seize my opportunities, there was really no reason why my well-selected, nicely arranged stock of ideas should have been so utterly destroyed. I was occupied with these gloomy reflections, through which, however, the prospect of a pleasant evening's chat, and supper with Kronow, came like a ray of light: I was also more or less attentive to the sound of the music, and afterwards to that of the rain, which was more in unison with my farmer's wishes than with mine. All this occupation brought me to eight o'clock, and to the end of the concert. Everybody left the room, and whither everybody went, I followed slowly. Unfortunately the busy secretary was nowhere to be met with; else he would probably have taken care of me. The greater portion of the audience dispersed to different parts of the castle; the rest hastened away with rustling umbrellas in different directions, without taking any notice of me, until I found myself standing alone, and undecided, within the principal entrance of the castle. "Who knows how long the rain may last! Hasten, that thou may'st fall into the arms of hospitality, for thy soul yearneth for condoling friends, and thy body for meat and drink!" With this I fixed my hat securely on my head, buttoned up my coat, made a sally, and ran (in a style that, perhaps, had not been seen in the castle square for many a day) in the direction of the lodge.

Was it this unusual, scandalous running, or was it that the very worst luck accompanied me to the last? I know not. Just before I had reached the lodge, an enormous dog started up, sprang at me, placed his paws on my breast, and bellowed and howled in my face with the voice of a lion. "Help! murder! help!" bawled I, as loudly as a man with sound lungs could bawl. The porter roared with laughter. This both consoled and vexed me, but I implored his assistance. "Augh the dog don't bite!" drawled he. "Help! help!" roared I. At length I was released, trembling in every limb. I took off my hat, partly in gratitude and partly in displeasure, and hastened forward without looking on one side or the other, as if I was fleeing from the dog. "Oh! it is a wearisome life at court," thought I; "and I am a poor dull simpleton who knows not how to direct or help himself: I really think I am no longer the same man!" In the midst of such thoughts, I found that I had lost the way which the farmer's son had shown me, and saw to my great astonishment that I was in the midst of a lonely place bounded by a few poor huts.

I hastened to the nearest hut to ask my way; but the scene which suddenly met my eyes kept me back. Before a handsomely dressed youth, stood an elderly woman with clasped hands, her face directed upwards, and her eyes overflowing with tears. "You make me mourn less for the loss of my good son who supported me," sobbed she. "May God bless you for what you do for me! but, dear, noble sir are you not indeed relieving yourself? You have no parents, and your place at court must cost you much."

"Never fear, good mother," answered the young man. "What you have had, and what you may further need,

can be spared from my superfluities; I make no use of strong drinks," continued he, "so that the money which is allowed me for wine, I can spend how I like."

"God reward you, and our good prince also, for supporting a poor woman like me!" My eyes were wet with tears, and I felt that I was myself again.

"It is well for me," thought I, "that I have been to court. The court is not to be blamed because I am unacquainted with its fashion and its state; there are good men at court: there are good men every where—they only differ in appearance according to the station in which they move. In my own station, I think, I behave tolerably well; I am now the man that I was, and thankful am I that I have recovered my position."

In the meanwhile the young man had left the hut, and having heard my request, politely offered to accompany me. His friendly, intelligent, conversation made the road appear very short, and before I was aware of it, and almost before I wished it, he pointed out Kronow's beloved farm-yard. I pressed warmly the hand of the noble youth when he left me. I longed to embrace him, and stood gazing after him till he was out of sight.

My peaceful shelter was glowing in the soft rays of the sun, then setting amid the clouds of evening. A beautiful rainbow adorned the sky, one limb of which seemed to rest upon the farm-house. A graceful boy now hastened towards me shouting, "Quick! quick! supper is ready!" My host, waiting for me at the entrance to the farm-yard, grasped my hand firmly, and welcomed me with a look full of kindness. The cattle were lying about the house ruminating—greedy ducks were crowding round a trough—and a shaggy dog came wagging his tail and whining a welcome. Within the porch I was met by the blooming wife of my friend, a smiling infant in her arms: "Welcome! welcome!" said she, "from the court to a rustic meal. Come in, it is all ready."

Joyfully did I enter the room. A large dish full of white asparagus was sending forth a pleasant steam—an inviting salmon displayed its bright red flesh—a tin, full of roast pigeons, was hissing on the wood ashes—and a flask of wine was sparkling on the table. I forgot all my vexations, and two hours afterwards slept away all remembrance of them; and now I am, as always, a friend with all the world and you.

THE NYMPH OF THE FOUNTAIN.

A FAIRY TALE.

AFTER some weeks of bustle in repairs and preparations, the new lord arrived, and a succession of feasts and gaieties began; not such, however, as to prevent his giving the minutest attention to the wants of his vassals and dependants, and diligently fulfilling all the duties of a feudal lord.

It was several weeks before Maud saw him except at a distance, but one evening he was crossing a courtyard alone, on his return from hunting, when she was trying to lift a heavy pitcher of water to her head. The count saw she could not manage it, and took hold of it, as she supposed, to raise it for her; but he carried it across the yard, and only put it on her head when she was close to the door she was taking it to. As he turned away, he excused his condescension to his own mind by telling himself that no knight could see a woman so overloaded, and not help her—though the thought crossed his mind that it was a pity she was such an ugly, crooked thing. Maud's thoughts were very different; all she had heard from the old housekeeper of his childhood and youth, all the steward and the new servants said of his exploits in battle, all she saw of his kindness to the poor, his liberal and judicious alms, his high sense of justice, and his anxiety to re-

medy all that had gone wrong with his vassals during the absence of their lord, his sincere piety—all had prepossessed her mind in his favour, and she had more than once caught herself wishing that she were in her original station, and wondering whether they would then have met, or if he would have remarked her if they had. She tried to check these thoughts as vain and idle, but they grew upon her, and his kindness in helping her with the pitcher, which for the first time brought her close to him, and allowed her to see his features clearly, added to the uneasiness, which she did not suspect was love, though she found herself really unhappy in the reflection that her menial station completely separated them, and that she could have no hope of exchanging it for another. She remembered, too, that, though nobly born, her father's rank was hardly equal to that of the young count; and besides she thought with pain how different his life and reputation had been from those which first drew her attention to Count Henry, and that, even should he ever know her name, he would probably hear it only with abhorrence. All these reflections proved to her how hopeless was the dawning affection she sometimes feared she felt, and she struggled against it till she hoped it was conquered; but the pain she felt at the arrival of the decree from Rome, by which the count was released from his vows, and free to seek a wife, opened her eyes.

Rumour, she knew, had been premature in the first announcement, though there was no doubt of the dispensation being ultimately granted; but now she might any day see him the husband of another. She almost made up her mind to leave the castle, and see if she could find an asylum in some convent, as a lay sister, but unconsciously she deferred it from day to day. At length the whole castle was in a bustle, preparing for a grand ball, which the young count had determined to give, to return the civilities of his neighbours. The day fixed for it arrived,—Maud had much to do, and not a little to bear, for in addition to her own heavy heart, the old housekeeper had been so much worried that she was crosser than usual. However, when the dinner was over, she told Maud that she could now spare her for a couple of hours, and she might go up stairs and look at the dancers. A sudden thought struck the poor girl—she ran to her room, seized her musk ball, which she had almost forgotten, half unscrewed it, and wished for a splendid dress. Instantly she heard a rustling of silks, and a magnificent white brocade, embroidered with rose-buds and violets, lay beside her, with all ornaments to correspond, and shoes, stockings—all she could need to appear in the ball-room. She uttered an exclamation of gratitude to her godmother, and hastened to wash the stains from her skin—and, thanks perhaps in part to fairy power, she found its whiteness unimpaired. She then dressed herself completely, and put her peasant's cloak round her, that she might reach the ball-room unobserved, in which she succeeded. Leaving her cloak behind a pillar in the ante-room, she entered the great hall, where all the rank and beauty of the district were assembled. She heard a buzz of wondering admiration—every body asked every one else who she could be—and soon the count came to her, greeting her as an honoured guest, and begged to know who it was that so graced his festival. Maud intimated that, for the present, she wished to remain unknown, and as this whim was not without precedent in those days, the count politely acquiesced, and led her to the upper end of the hall, where his step-mother, the Countess Hildegard, his father's widow, was doing the honour of the castle. The old countess, who was noted for her pride, received her with much dignity, not ungraciously, but with some reserve, as she felt doubtful of the stranger's rank. As soon as he possibly could, Count Henry asked Maud to dance, and was so much delighted with her wit and beauty, and her modest, unassuming demeanour, that he could hardly persuade himself to leave her, and he

was again and again at her side, till she suddenly remembered that the time the housekeeper had spared her was more than elapsed, and she must hurry away. She watched an opportunity, and contrived to slip out unperceived—she threw her cloak round her, ran to her little room, took off and hid her dress, put on her servant's clothes, not forgetting the hump, and, having again coloured her skin, she ran down stairs to the kitchen.

She found Dame Gottfried very much vexed at her delay; and the scolding which followed was difficult to bear in the moment of half-intoxication she felt at the great admiration she had excited, at her first appearance in the society of her proper rank. But she took it patiently, and so diligently set about the work she was ordered to do that the housekeeper left off scolding, and at last went to bed, before the ball was completely at an end. Maud stole back into the ante-room, in reality to have another glimpse of the count; or, as she said to herself, that she might see if the guests were likely to go away soon. She stood among the servants, and heard all their conjectures about the beautiful stranger, who had disappeared so unaccountably; and it gratified her much to learn that the young count had sought her everywhere, and had made all sorts of inquiries about her equipage—how she had come, and whence—(of course without success; no one had seen her arrive or depart)—and that, though obliged to dance repeatedly during the night, he had seemed, the servants remarked, to have lost all pleasure in the ball, and to be thinking only of discovering the unknown lady.

Moon after this the guests began to depart,—and ere long all was silent, and every one gone to rest but poor Maud, who turned and turned on her trundle-bed, and wondered how she could be so foolish, and tried to still her mind, which seemed all in a whirl, and prayed for help, and guidance, and courage, till at last, from very weariness, she dropped asleep. She woke late the next morning, but luckily got down stairs before the old housekeeper, who had been much tired.

For some days she did not see the count, but she heard that he was much from home, and that, in fact, he was searching everywhere for the unknown lady;—and at last that, despairing of seeing her again otherwise, he had determined to give another ball, in hopes she might come to it. Accordingly, the castle was again all preparation, and on the appointed day it was once more filled with guests. Maud had worked very diligently all day, hoping the housekeeper would again give her leave of absence, but at first she refused, saying, she had stayed too long the last time, but Maud begged so hard, that the old woman, who was really fond of her, yielded, on condition she would not exceed the time specified. Maud flew to her room, washed off the stains, and seized her musk-ball, wishing, as she unscrewed it, for a dress yet more splendid and becoming than the last. As she made the wish, a pang shot through her mind that she had wasted the second of the three gifts the ball was to grant her—she had but one left! Would not her first dress have done very well? and might there not be many events of life in which she would more need her fairy godmother's help? Even now, was the dress all, or even the chief thing she wished for? But even to herself she shrunk from acknowledging her love for Count Henry. However, repentance came too late, for a magnificent dress of pink cloth of silver lay before her, trimmed with lace and embroidery, such as a princess could hardly wear, and with every thing else, even jewels, to correspond; and Maud forgot her regrets in the delight of seeing herself look lovelier than ever, and in anxiety to know what the count would say and do.

She was quickly in the ball-room, and again her entrance was unperceived till all risk of discovery was over—most likely by the assistance of the Nymph of the Fountain, though unseen. Count Henry, who had

been looking eagerly for her, came towards her immediately, and led her at once to the old countess, whose haughtiness was not lessened, either by the success with which the stranger had kept her secret, or by her son's evident admiration of her; but the magnificence of her dress made some impression, and she received her politely enough. The count led her out to dance, and then sat beside her conversing, without noticing any one else, till half the ladies in the room were affronted, and poor Maud's head was so turned, that time flew by unnoticed. The striking of the clock, more than an hour beyond that at which she should have been in the kitchen, roused her: she started up, but could not escape the count. To go then was to reveal herself, which she had not courage to do, the more because she had discovered that the countess Hildegard was of a family whose hereditary enmity to hers she well remembered. It was long before she could find an opportunity of getting away; at last she succeeded, at a moment when the count's attention was purposely fixed by the Countess Hildegard, who much disliked his devotion to the stranger. With an aching heart Maud changed her dress, almost convinced of the count's affection, and now unable to close her eyes to her own, but more than ever fearful that her name and family would be an insurmountable bar between them, even should the obstacles of her want of fortune, and her present mental condition, be overlooked.

Dame Gottfried was excessively angry at her long absence, and asked where she had been, declaring she had twice searched the ante-room in vain for her. Maud truly replied that she had not quitted the castle, but had been twice in her own room; however, the old woman's scolding continued more bitter than ever, and poor Maud could not help shedding tears. But everything comes to an end, pain as well as pleasure, and at last the guests were gone, and Maud was alone in her little room, weeping bitterly as she knelt by her bed side. Gradually her thoughts arranged themselves into prayer, and soon she became more tranquil, though she saw no release from her sorrow. She fell asleep, debating with herself whether she ought not to leave the castle next day, at any cost; but when she awoke in the morning, she was as undecided as ever. In truth, though she was hardly herself aware of the motive, the count's evident admiration gave her a hope, which she could not resolve to abandon, and she determined to wait the course of events.

That day was one of much trial, for Dame Gottfried had not forgotten her crime of the night before, and lost no opportunity of finding fault. Poor Maud had never yet suffered so much: but the day wore on, and, tired to death, in mind and body, she fell asleep almost the moment she laid down in bed. It was some comfort to her to learn, on the following day, that the count was indefatigable in his efforts to trace her, and, very soon after, he once more determined to try whether a third ball would obtain him another interview; when he promised himself not to lose sight of the mysterious stranger for a single instant.

The ball was given, but no entreaties of Maud's could prevail on the housekeeper to let her go and look at it. No, she said; she was determined to punish her for staying so long the last time; and she kept her at work, at one trifling thing or another, till just before all was over, when, moved by Maud's good temper, she desired her to come with her, and stand beside her, to see the guests depart. Accordingly they went to the entrance-hall, and there Maud saw Count Henry leading to her a beautiful young lady, with whom she remembered he had been dancing when she entered the room on the night of the first ball. The whispers of those around soon made her know that this was an heiress of high rank and great wealth, whom his step-mother wanted him to marry. It was some comfort to learn, at the same time, that he had paid little attention to this lady, or to any one else, all the evening, but had

seemed intent on watching for the stranger, who, to every one's surprise, never appeared. Various were the conjectures about her, and strange and wild enough; but none approached the truth, and Maud could hardly help smiling, as she heard herself supposed a fairy—a witch—an Eastern princess, who had loved the knight in Palestine, and a hundred other impossible stories imagined.

But it was gratifying to hear all unanimous in praise of her beauty, and grace, and modest demeanour, and declaring that it was no wonder the count was so captivated. How little the speakers guessed that the shabby, crooked kitchen-maid, who stood in the corner unnoticed by any, was the lovely and splendidly-dressed lady they were so curious about! Poor Maud's tears were less bitter this night than after the last ball, for, besides all these unintended encomiums, she felt she had done right in conquering her impatience, and obeying the cross old housekeeper so implicitly.

Many days had not passed before the young count was said to be ill. His search for the unknown lady had been unceasing, and his disappointment preyed on his spirits, till at last it threw him into a fever, and soon his life was pronounced in danger. The household was in despair, for he was much loved, and the old housekeeper, who had seen him born, sat over the fire weeping in agony. Maud was half tempted to give her third wish to his recovery; but, while she hesitated, she resolved first to try if a little *hope* would be of any use to him; so she went to Dame Gottfried, and said that the godmother who had taught her everything else she knew, had given her some knowledge of medicine, as she had already proved; and that, if the housekeeper would allow her, she thought she could prepare a draught that would do their lord good. Dame Gottfried cross-questioned her a good deal, but Maud would not tell precisely what she would make it of, and she insisted so much on the benefit she expected from it, that the old woman, who had more than once experienced Maud's skill in simples, agreed to let her try it. Maud, therefore, went into the garden, gathered various herbs, and made a drink of their mingled juice; but at the bottom of the cup she put a ring, which she had worn on the night of the second ball, and which the count had particularly admired. It was part of the splendid dress her godmother's gift had produced. Dame Gottfried took the dose to her master, and with some difficulty prevailed on him to drink it. To please her, he took the greater part, and was just setting the cup down, when the sparkling ring caught his eye. He took it out with some curiosity, but instantly recognising it, he started up, demanding who had put it into his draught. Dame Gottfried protested her total ignorance of it, expressing her wonder with such volubility that the count at last, half angry, insisted on knowing the history of the medicine. She told him it was made by one of the kitchen-maids, who had lived with her before his return home, and that she was sure the poor girl could know nothing of such a splendid jewel—it must have got into the cup by magic.

"Send her up to me," said the count.

Dame Gottfried hesitated, saying she was a mere kitchen wench, though a very tidy good girl, but not at all fit to come up stairs to his lordship's apartments; besides, she was an ugly crooked thing, whom he could not care to see.

All was of no use. The count peremptorily ordered the girl to be brought in. So down went Dame Gottfried, muttering that Maud's draught must have turned his brain; she was sure he was delirious.

Maud had expected this order, and had laid her Sunday clothes in readiness; so she was quickly dressed as the housekeeper wished, and ushered into the count's presence. He questioned her about the ring. She said it was a secret she could tell to him alone; so he ordered Dame Gottfried to leave the room, to her great vexation, and desired Maud to speak without fear. She

at once told him the ring was hers, and related her whole story. With bitter pain she saw a shade pass over his countenance when she mentioned her father's name, but it cleared off a good deal when he heard she was the daughter of the first wife, and disappeared gradually as she narrated, in a few words, her subsequent history: but she saw that he was still doubtful, that he could hardly believe *she* was the beautiful lady who had so fascinated him in the ball-room; so she asked if he wished to see her dressed as she had then been—in half an hour she could convince him of the truth of at least so much of her story. He called in the housekeeper, and desired her to see Maud to her room, and to remain outside the door, without leaving it for a moment, till she should come out again, and then bring her down to him.

Dame Gottfried wondered at this order, but could not avoid obeying, though it convinced her that she had been right in thinking the young count delirious. Maud fastened the door, after giving the poor old dame a chair to rest on, and began her toilette. She felt that her fate now approached its crisis; for, unless the count should at once seek her in marriage, she must immediately fly from the castle, and again earn her livelihood in a strange place, without the freedom of heart which had hitherto enlightened her lot. An asylum in a convent would be her best hope, and her jewels prevented her being entirely penniless, so that she might have presented herself under her real name, if she kept at a sufficient distance from her native place to avoid the ill consequences of her father's crimes.

She put on the white dress, the first of her godmother's gifts, and the one in which she had first publicly appeared in the rank she was born to. When she was ready, she opened the door. Dame Gottfried screamed with surprise, and almost fainted, and poor Maud had much trouble in recovering and composing her, before she was able to accompany her to the count's apartment. They found he had also dressed; and Maud augured well from seeing that his toilette had been at least as carefully made as her own. One glance was enough to satisfy him that he had indeed found the unknown lady. He received her with the utmost joy and respect, and at once entreated she would honour him with her hand—glad, he said, that he was able to replace her in the rank she deserved and would adorn; adding that, whatever he had heard of her father, her mother's virtues had not been forgotten, and he had even heard that the peasants regretted the death of their good young lady, whom more than one of them had intended to save. Maud now gave the count more minute details of her family and of her early life, so as to preclude all possibility of her being other than she represented herself; and she showed him a locket containing her mother's hair, and having her name engraved on it, the only trinket she possessed of her childish days, for her stepmother had not thought it worth taking. She did not refuse his offer of marriage, and he led her to the Countess Hildegard, and announced his intentions. The old lady was excessively angry, first, because she had planned another match for him, and still more, because he had chosen a girl totally without fortune; for the possessions of Maud's father had lapsed to the crown, as no heir appeared to claim them, and had been granted immediately to another family; but, worst of all, Maud was of a race with whom the countess's family had long been at enmity, and she violently opposed the marriage. However, Count Henry was not to be moved. As his stepmother refused to remain in the castle, or in any way to sanction his choice by her presence, Maud removed to a neighbouring convent, where she remained preparing herself, by prayer and meditation, for her new state of life, till the count's arrangements were complete. The marriage then took place with great pomp, for he invited all his neighbours, that he might introduce his bride; and, while he thus proved that he was not

ashamed of his choice, might enjoy the admiration she excited. At his special request she was married in the white dress he had first seen her in; and at the conclusion of the ceremony, she dedicated it to the use of the altar, resolving that one of her earliest occupations should be to make it into a magnificent vestment.

(To be continued.)

EXTRACTS FROM NEW WORKS.

THE INTERIOR OF A HAREM.

"THE women made me sit down; and when I placed myself in the usual European manner, they begged me in a deprecating tone not to remain in that constrained position, but to put myself quite at my ease, as if I were in my own house. How far I was at my ease, installed *à la Turque*, on an immense pile of cushions, I leave to be imagined by any one who ever tried to remain five minutes in that posture.

"I was determined to omit nothing that should give them a high idea of my 'savoir vivre,' according to their own notions, and began by once more gravely accepting a pipe. At the pacha's I had managed merely to hold it in my hand, occasionally touching it with my lips, without really using it; but I soon saw that, with some twenty pairs of eyes fixed jealously upon me, I must smoke here—positively and actually smoke—or be considered a violator of all the laws of good breeding. The tobacco was so mild and fragrant that the penance was not so great as might have been expected; but I could scarcely help laughing at the ludicrous position I was placed in, seated in state on a large square cushion, smoking a long pipe, the other end of which was supported by a kneeling slave, and bowing solemnly to the sultana between almost every whiff. Coffee, sweetmeats, and sherbet (the most delightful of all pleasant draughts), were brought to me in constant succession by the two little negroes, and a pretty young girl, whose duty it was to present me the richly embroidered napkin, the corner of which I was expected to make use of as it lay on her shoulder, as she knelt before me. These refreshments were offered to me in beautiful crystal vases, little gold cups, and silver trays, of which, for my misfortune, they seemed to possess a large supply, as I was obliged to go through a never-ending course of dainties, in order that they might have an opportunity of displaying them all.

"My bonnet sadly puzzled them; and when, to please them, I took it off, they were most dreadfully scandalized, to see me with my hair uncovered, and could scarcely believe that I was not ashamed to sit all day without a veil or handkerchief; they could not conceive, either, why I should wear gloves, unless it were to hide the want of henna, with which they offered to supply me. They then proceeded to ask me the most extraordinary questions—many of which I really found it hard to answer. My whole existence was as incomprehensible to this poor princess, vegetating from day to day within her four walls, as that of a bird in the air must be to a mole burrowing in the earth. Her life consisted, as she told me, of sleeping, eating, dressing, and bathing. She never walked further than from one room to another; and I can answer for her not having an idea beyond the narrow limits of her prison. It is a strange and most unnatural state to which these poor women are brought; nor do I wonder that the Turks, whose own detestable egotism alone causes it, should declare that they have no souls."—*Wayfaring Sketches among the Greeks and Turks, by a Seven Years Resident in Greece.*

THE ENSLAVED NEGRO.

"He and his family, together with some of his ancestors, were slaves in Peru, all born in the city of

Lima; after the death of his first owners he was sold from one party to another, sometimes having kind masters, more frequently severe. At last he was purchased by a merchant residing in the town of Payta, in the same province; he had a female slave, for whom the subject of the present biography formed an attachment. The owners are generally glad to discover affairs of this kind amongst their slaves, and often accelerate the matter, knowing well that an increase of what they brutally term 'stock,' may be the result. They were married, and the ceremony consisted in the master telling them to 'go and live together.'

"Matters went on smoothly and lovingly for some time; at last the severity of the owner displayed itself in repeatedly flogging the man; this was borne with fortitude for a long time.' (At this part of the history our host exhibited a portion of his body which was scarred, and in welts from the lash. The poor woman sighed deeply, and I confess I felt much for them.) 'On an oppressively hot day his wife was ordered into a store with him to perform some laborious work; she was too weak and unable for the required exertion; the inhuman master tied her up to a post and beat her severely with a lash composed of twisted thongs of bullock hide' (she had also her marks of punishment to show).

"She writhed under the punishment; her son, then a child, screaming at her feet; there was no mercy or cessation, until the arm of the master was fairly tired. The husband of this poor creature was looking on with, as he described it, 'grinding teeth.' What must have been his feelings! He then uttered an inward vow, both for revenge and an attempt at escape, if it cost him his life. This man and wife now laid their plans together; they lulled the suspicions of their owner by abject submission to all his orders for months, and perhaps he lauded the use of the lash for its apparent success in completely breaking the spirit of his slaves.

"Their plans were now matured: there were some English and American ships in the harbour; this merchant was in the habit of trading with some of them, and furnishing others with the stores they required. One evening after dark the negro told his master that Captain So and so wanted to speak with him particularly, and that he was at the hotel situated on the beach. (I may also add, from my own experience, this hotel at Payta is the chief one in the place, commands an extensive view of the bay and anchorage, has a wharf for its special accommodation, and was conducted in excellent style by an Englishman at the time of my sojourn in it.)

"He never hesitated, or for a moment doubted the veracity of his injured slave. He left his house, and as he was walking along the beach towards the hotel was stabbed to the heart, dragged down, and thrown into the water. The slave had previously provided a boat near at hand, which he had stolen off the beach about an hour before; his wife and child were in readiness; all being quickly embarked, he paddled silently out of the harbour, making a turn round nearly opposite the burial-ground, to avoid the shipping. Having in this manner rounded the northern head of the bay, he laid down his paddles, his wife and he taking an oar each, and pulled hard for their lives and liberty. The child and a bag of bread in the bottom of the boat.

"They had only a small jar of water with them, and consequently suffered much. However, after patient exertion, day and night, they succeeded in passing the precincts of Peru and arriving at Tacama, where they were 'free,' and kindly received. They 'squatted' on the bank of the river, cleared the ground, and erected the hut, where they seemed to enjoy each other's affection, and the freedom that human beings can feel who escape from tyrannous slavery.

"I inquired, through my interpreter, whether he

felt any regret at assassinating his late master? With gleaming eyes, and his whole frame presenting a true picture of demon-like ferocity and revenge, he answered rapidly, 'No.' Without acting so he would surely be retaken, as his owner, if he lived, would miss him in less than an hour; as it was, he had several hours' start, and cleared the precincts of Peru before his absence could be detected; and ended by saying that another slave of the same owner attempted to escape some time before him, 'that he was brought back, and so severely cowed that he died the next day.'—*Coulter's Adventures on the Western Coast of South America.*

PELICANS FLYING AND FISHING.

"It is a pleasant sight to see a flock of pelicans fishing. A dozen or more are flying, on heavy, flagging wing, over the sea, the long neck doubled on the back, so that the beak seems to protrude from the breast. Suddenly, a little ruffling of the water arrests their attention; and, with wings half-closed, down each plunges with a resounding splash, and in an instant emerges to the surface with a fish. The beak is held aloft, a snap or two is made, the huge pouch is seen for a moment distended, then collapses as before; and heavily the bird rises to wing, and again beats over the surface with its fellows. It is worthy of observation that the pelican invariably performs a somerset under the surface; for descending, as he always does, diagonally, not perpendicularly, the head emerges looking in the opposite direction to that in which it was looking before. When the morning appetite is sated, they sit calmly on the heaving surface, looking much like a miniature fleet.

"In the evening, as I have stated, we see them pursuing their laborious course to repose. Standing at the door of Bluefields, which from a slight elevation, commands a wide prospect of the beautiful bay, I have often watched in the evening, while the sun, sinking among his gilded piles and peaks of cloud on the horizon-sea, leaves the air refreshingly cool and balmy, while the dying sea-breeze scarcely avails to break the glassy reflection of the surface,—the straggling flocks of pelicans, from a dozen to forty or fifty, passing slowly along over the shore. On such occasions, they manifest a decided tendency to form long continuous strings, like ducks. When the flocks are beating for fish, or sailing round and round on the watch, there is no such arrangement, but all circle in a confusion equal to that of the Planets of the Ptolemaic system. Yet at any time of the day, in taking a lengthened flight, whether shifting their locality, or slowly sweeping over the sea, they usually take a lineal order.

"In flying thus in lines, I have been struck with the unity which they manifest in their motions: the flight is performed by alternate intervals of heavy flappings, and sailing on outstretched motionless wing; and the resumption or suspension of the one or the other state is regulated by the leading bird of the line. For example, the first begins to flap; in an instant the second begins, then the third, then the fourth, and so on, with perfect regularity of succession; and neither ceases till the first does, and then only each in his own turn. That this does not depend on the period of each motion being constant, is shown by the fact, that the duration of either state is very varying and arbitrary. If a bird be following the same course, near at hand, but not within the line, he does not regard the succession at all, but governs his own motion.

"The pelican, on alighting on the water to swim, brings his feet, which before had been stretched out behind, into a standing position, and, as it were, *slides along the surface* for several yards before he swims."—*The Birds of Jamaica.*

THE WISTFUL HEART.

S. M.

LOOKING back
Wander we through life's long track,
Looking back
Where a parted sun's soft ray
Lingers yet across the way.

Gazing home
As the slow bark cleaves the foam,
Gazing home;
Seems the haven, far before,
Nothing to that radiant shore.

From thy side
To that shore pale phantoms glide,
Pale beside thee, but they wear
Hailors of refulgent air,
Standing there,
And thou becomest—but in vain,
Never will they come again!
Strange it seems,
This vague show of fading dreams,
This wan Present, shall at last
Be the bright, calm, irrevocable Past!

O! look on!
Turn thy face from glories gone!
Underneath yon dim sea-line
Founts of deeper glory shine;
Watch and wait, till in thy sight
Shall that dimness change to light,
Pledge of the coming dawn that knows not night.

It may be so—
I cannot tell—I do not know.
Shall the frail vine forsake its prop, to lean
On cords let down from heaven, unfelt, unseen?
I may believe,—
That hinders not that I should gaze and grieve,
Seeking I know not what, and loving what I leave!
Ah! chide me not, the vexed spirit saith,
Love is more strong than Faith.

Is there no art,
Thou weary, wifful Heart,
So to transform thy Faith that it shall be
The shadow of a near Eternity?—
Not leaning on the Hour which cannot last,
Not weeping o'er a perishable Past,
But eagle-eyed—and patient as a dove,
Lifting itself upon the wings of Love!

NATURE has sown in man seeds of knowledge, but then they must be cultivated to produce fruit.—*Lord Collingwood.*

The Comforter.

FROM A PAINTING IN THE NEW WATER COLOUR EXHIBITION, BY J. H. MOLE, ESQ.

VOL. IV.

ENGRAVED BY G. DALZIEL, ESQ.

THE BATTLE OF HASTINGS.

"A thousand sixe and sixtie yoere, it was, as we doe read,
When that a comet did appeare, and Englishmen lay dead;
Of Normandie, Duke William then, to England ward did sayle,
• Who conquered Harold with his men, and brought his land
[to baile."

It was on the 28th of September, 1066, that William the Bastard, Duke of Normandy, landed on the English coast at Pevensey, a few miles from Hastings. As he stepped from his boat his foot slipped, and he fell down on the ground.

"An evil omen!" groaned out those near him, and the croaking note was quickly caught up and re-echoed by numbers around.

"By the splendour of God! seigneurs," said he, "you are mistaken;" and grasping, even as he instantly rose, as much soil as he could clasp in both his hands, he exclaimed in a joyous voice, "I have seized England with my two hands!"

This ready wit reassured his people,—perhaps saved his cause; and one of his followers, quickly seconding him, ran to a hut, snatched a handful of the thatch, and turned to the duke, saying heartily,—

"Sire, come forward, and receive seizin; of this land I give you seizin—without doubt the country is yours."

"I accept it," said the duke; "may God be with us."

At this moment the noble and gallant King Harold—for by the consent of the people he had been crowned—was in the north of England, whither he had sped to subdue a revolt, excited by his brother Tosti, and, aided by the king of Norway: Harold was successful, and was feasting and rejoicing after the victory, when lo! a knight arrived from Hastings.

"The Normans are come! are come! They have landed at Hastings! Thy land will they wrest from thee if thou canst not well defend thyself! They have enclosed a fort, and strengthened it round about with palisades and a fosse."

"Sorry am I," returned the king, "that I was not there to meet them. It is truly an evil hap. But thus it hath pleased the Heavenly King; and every where at once could I not be."

Thus was Harold taken at every disadvantage. The fleet which had been for some time hovering around the Cinque Ports, in expectation of this invasion, had but lately, partly from the supposition that William had abandoned his design, been dispersed, and Harold was with all the flower of his troops at the farther end of his kingdom. He instantly came southward by forced marches with the least possible delay; but his troops were necessarily in some degree disordered and fatigued. The time indispensably occupied by Harold in his journey, and in his subsequent preparations, proved, perhaps, the salvation of William, by giving him time to survey the country, to prepare defences, to cheer, refresh, and thoroughly arrange his army.

When the opposing forces were approaching each other, Harold sent forward spies to reconnoitre, who were seized and carried to William's tent. The duke ordered them to be well treated, to have abundant refreshment, to be taken through his lines, and shewn all his preparations, and then to be courteously dismissed. When they returned, they spoke in high terms of the duke, but told Harold that William had more priests with him than knights or other people. But Harold replied,—

"Those are valiant knights,—bold and brave warriors, though they bear not beards or moustaches as we do."

It is not often that two such leaders meet in battle. King Harold is described as a "noble Saxon," having all the personal characteristics which distinguished and elevated the magnates of that princely race. His stature was remarkably tall, and his limbs were finely formed. He was an accomplished man; his bravery was proverbial, and his character and conduct were benignant and noble. Earl Godwin's daughter was described as a rose from a thorny stem,—*"Sicut spina rosam, genuit Godwynus Editham;"* to her brother Harold an equally flattering, though a more masculine eulogy, might with truth have been applied. The only slur ever thrown on his character seems to have been a somewhat avaricious partition of the spoils of the battle of York, and this has hardly been confirmed. He had certainly a rightful claim to the crown, and was amply qualified to uphold its dignity; he was the legitimate scion of a noble race; he was a son of the soil, and he was offered the crown and was chosen king by the people.

William, being a bastard, could have no hereditary claim; and if it were indeed true, that Edward the Confessor had willed the crown to him, it was at least undeniable that Edward had no right thus to dispose of it.

William is described as of "a good stature, proud of porte, very corse, and bigge-bodied, with a cruell countenance, and a bald forehead." His strength was prodigious; he used a bow which no other arm could wield, and which he would bend when sitting on horseback, by stretching out the string with his foot.

Many days necessarily intervened between the landing of William and the great battle. The time was disposed of by him in the most politic manner; not by bold advances into the country, but by raising fortifications along the coast as refuge for his troops in the event of his defeat. At length he advanced inland about seven miles, north-west of Hastings, to a heath thereafter and still called Battle.

"So called because in battle here,
Quite conquered and o'erthrown the English nation were."

The Normans "betook themselves all night to their orisons, and were in very serious mood. They made confession of their sins, and accused themselves to the priests, and whose had no priest near him, confessed himself to his neighbour."

"The day on which the battle was to take place being Saturday, the Normans, by the advice of the priests, vowed that they would never more, while they lived, eat flesh on that day. Giffrei, bishop of Coutance, received confessions, and gave benedictions, and imposed penances on many."

"The priests had watched all night, and besought and called on God, and prayed to him in their chapels which were fitted up throughout the host. They offered and vowed fasts, penances, and orisons; and they said psalms and misereres, litanies, and kyriels; they cried on God, and for his mercy, and said pater-nosters and masses."

After confession and mass this evening, William, kneeling down, vowed solemnly to edify and endow an abbey on the spot where the sounds of victory—if victory were vouchsafed to him—should first salute his ear.

The Saxons, on the contrary, were very merry and enjoying themselves. "All night they ate and drank, and never lay down on their beds. They might be seen carousing, gambolling, and dandling and singing; Buslin they cried, and wissel, and lattoome and drinche hall, drinchindrewart and drintome, drinche-helf, and drinchtome."

(1) "Des ke li Reis Ewart fu mors,
Heraut ki ert menant è force—
Se fist énoindre è coroner;
Unkes al Duc n'en volt parler,
Homages prist è feeltes
Des plus riches è des alns nez."

Roman de Rou.

(1) Hornfield, Sussex.

One, however, their leader, was differently occupied.

"Li rois, li mult fu travaille
La nuit se est reposé;
L'ar matin se est levé,
Sa messe oir est alé,
Assez près à un mostere
Son chapelain fist chanter."

While thus piously engaged, the cry came—

"Le dux sur nus vient armé."

Without an instant's delay, Harold armed himself, and whilst engaged in this occupation, his mother Githa came to him with the unaccustomed request, that he would not adventure his person in the battle. Much surprised, —for never before had his mother's fears stood in the way of his military arrangements,—he looked for some explanation of her motives, but heard only an earnest renewal of the request. She pressed him most vehemently, but in vain; she besought him with a passion of tears to accord her boon: disturbed, but no way shaken, he turned away.

"Nay, my son," said the abbot, "this must not be; for what saith holy writ?—Despise not the tears of thy mother."

"Far be it from me, reverend father," returned Harold, "to do aught unbecoming to me as a knight and a Christian man; but in this I may not choose but lead to the battle."

"Oh! go not, my son," interrupted his mother; "go not, I beseech thee. Full well do I know that it will be a disastrous day for thee, if thou ledest to the combat. Let thy brothers,—let the strong-armed Garth, the faithful Leowine, lead the force, and so shall success attend our prayers, and the haughty Norman be quelled."

"Madam,—our mother, fain would we pleasure you in this matter, but—it may not be. What!" exclaimed he, vehemently, "shall it be said that HAROLD shrank from the encounter like a base-born churl?"

"From no encounter where thy honour calls thee would thy mother's voice dissuade thee; but this—"

"And this?"

"THY OATH!"

In a moment the colour and excitement which had hitherto lighted up the countenance of Harold forsook it: his lips became ashy white, and a tremor shook his frame. He quickly subdued it, however.

"My mother, that oath was obtained by fraud, my heart not consenting the while; such a vow bindeth not the conscience."

His mother mournfully shook her head.

"Nay, holy father, I appeal to you whether I am not free in this matter?"

The abbot preserved an ominous silence, and Harold was evidently disconcerted. At this moment, however, an exciting sound pierced the walls of the chapel,—the arrival, as it might be, of tidings of import, and the clamour of eager voices. In an instant the king forgot his mother's tears, the abbot's warning, his own misgivings. His eye flashed as he suspended round his neck his huge two-handed sword.

"The people have risen around me on every side: they have followed me from York; the Londoners uphold my standard, and the men of Kent crowd to the van—never shall it be said that their leader quailed in the hour of danger. Foremost shall my sword flash in the fight. So help me God and the holy saints!"

Borne away by the king's enthusiasm, his friends no longer sought to thwart his determination; and, despite her tears and forebodings, the Lady Githa's eye kindled with admiration as she looked on the magnificent bearing of her son. But ere long her maternal fears re-

sumed their ascendancy, and amid fast-falling tears she whispered some words to the abbot.

"My son," said he, "if the prayers and intercessions of those who owe their worldly well-being to thy bounty may avail thee, rest assured that the voice of supplication will not be silent here whilst thou art engaged in thy perilous strife. But the issue rests not with us. Suffer then, my son, two brothers of our house to follow thee to the field: it may be that their ministry may be blessed to some good end."

"As you please, reverend father; but I pray you, delay me not."

So, accompanied by the two monks, Osgood Chuppe and Ailric de Childemaister, Harold eagerly hied him to the fight.

In the immediate preparation for the battle, William's presence of mind averted an omen which might have had a paralyzing effect on the exertions of his superstitious followers. In putting his hauberk over his head, he inadvertently turned the wrong part to the front, but quickly altered it; not, however, till he had seen the countenances of those around him overcast.

"I commend myself," said he, "to our Lady. Let not this mischance trouble you. The hauberk which was turned wrong, and then set right by me, signifies that a change will arise out of the matter we are now moving. *You shall see the name of Duke changed into King.* Yea, a King shall I be, who hitherto have been but Duke."

Then he crossed himself, and straightway took his hauberk, stooped his head, and put it on aright; and laced his helmet and girt his sword, which a varlet brought him."

And it is said that he hung beneath his armour certain of the relics on which Harold had sworn allegiance to him.

The Normans had fine cavalry, of which the English were destitute: their archers also did much execution. The duke drew up his army in three lines: in the first were the light-armed foot, the archers, and slingers, clad in short coats; in the second, the heavier foot, who were defended by coats of mail; and in the third, the cavalry. Here rode he himself on a magnificent white charger, with a baton in his hand; and here was unfurled the sacred banner which had been blessed by the pope, and was sent to William as a gift from his holiness. It was of scarlet silk, and bore a cross embroidered in silver.

The English were drawn up in one impenetrable wedge. They carried axes, spears, bills, clubs, swords, and triangular shields. They wore close, short hauberks, and rude helmets, which defended the neck, hanging over their garments. The men of Kent were placed in the front, their "privilege" to this honour being fully understood and allowed. The Londoners were placed next in the roll of dignity, their right being to guard the king's person and defend his standard.

On a gently rising ground stood Harold on foot with his two brothers, and close to his standard, which represented an armed man, and was wrought in gold and jewels so magnificently that William thought it worthy to be an offering to the pope, to whom, after his conquest, he forwarded it.

The signal for the onset was given, and the Normans rushed forward to the charge, their minstrels chanting and the host joining in the burden of their inspiring war-song—the "Song of Roland."

Not the strains of the *Marseillaise Hymn* to the misguided French revolutionists,—not the spirit-stirring tones of *See the conquering Hero come*, during the first enthusiastic ovations to Him of Waterloo,—not the majestic sounds of *God save the King* to the "Church and King" Pittite of good King George III.'s days,—nay, nor even the soul-exciting strain of *Over the water* to the enthusiastic Jacobite of the last century—could excite anything like the intensity of enthusiasm which is ascribed to the influence of the "Song

(1) The tearful dissuaves of Harold's mother are named in some old book, and Master Wace, in the *Roman de Rou*, makes Garth earnestly dissuade his brother, the king, from personal combat, because of his previous oath to William. On this oath, with others, see *Sharpe's Lond. Mag.* vol. iii. p. 45—"Some Ancient Customs of England."

of Roland" over the Norman and French hosts for many centuries succeeding the death of this redoubtable Paladin. Nay, even to this day tradition lingers round the spot where he fell: a flower of the district is called the "Casque de Roland;" the stroke of his sword is still exhibited upon the mountains; and the memory of the hero is still embalmed in a thousand shapes.

In valour, in wisdom, in prudence, in earnest religious zeal, in capacious intellect (far before his age), in beneficence, and in good government, perhaps Charles the Great comes only second, if second, to our own revered Alfred. But while the English monarch's actions are recorded only by the matter-of-fact historian, or, perhaps, to speak more accurately, by the historian who *meant* to be matter-of-fact, Charlemagne's are enveloped in a maze of wonderment by the thousand fabulists who have clothed his deeds in all the deceitful hues of romance. And it is well to be supposed that they have rather disfigured than adorned the noble character which needed not "the meretricious aid of ornament."

However, he and his Paladins have formed the theme for a cycle of romances hardly less extensive than those which immortalize the prowess of our British King Arthur and the Knights of his "table ronde."

One of the most distinguished of these Paladins was Roland, the nephew of Charlemagne, and the hero of Ariosto's celebrated romance; and the sad and premature death of this brave knight by the blackest treachery at Roncesvalles wove a halo of interest around him, which his own virtues and valour, distinguished as they were, would hardly have obtained. His name and memory were embalmed in strains which formed the war-cry of his countrymen for ages after his dust was mingled with that of his native earth.

"And thus of Roland's deeds they sung,
And Norman shouts responsive rung,"

when William the Bastard hearkened on his followers to slaughter and to victory on the bloody field of Hastings.

From nine in the morning until sunset did the battle continue with unabated vigour, and then William had gained no advantage. Harold stood with his mighty phalanx, firm as a rock, and as impenetrable. "William was in fact beaten." But stratagem achieved what valour could not effect. The Normans gave way; the English were deceived by the *ruse*; they eagerly and rashly pursued, and the invincible line was broken. The error was perceived not till it was too late to retrieve it.

A chance arrow, shot upwards, struck Harold above his right eye, and put it out. He drew out the arrow, and throw it away, and in his agony he stooped and leaned upon his shield. Great was the dismay of the English when the tall form of their heroic leader was seen to bend.

"Loud was now the clamour, and great the slaughter; many a soul then quitted the body it inhabited. The living marched over the heaps of dead, and each side was weary of striking. He charged on who could, and he who could no longer strike still pushed forward. The strong struggled with the strong; some failed, others triumphed; the cowards fell back, the brave pressed on; and sad was his fate who fell in the midst, for he had little chance of rising again; and many in truth fell who never rose at all, being crushed under the throng."

At length the Normans reached the standard where Harold, though still in agony, had resumed his erect bearing and was fighting desperately. His brothers had both fallen, he himself was bleeding profusely from various wounds, when lo! a momentary and last gleam of light flashes on an uplifted Norman sword, but dies away even before the sudden stroke has borne down beneath it the noble and ill-fated Saxon king.

Thus, at the eleventh hour, was the victory won.

Then William ordered his standard to be erected, and there, in the midst of the dead, he had his tent raised and his supper prepared. "And he ate and drank amongst the dead, and made his bed that night upon the field."

Sad was the scene that Sabbath morning when the noblest matrons and fairest maidens of the land—when widowed mothers and bereaved children crowded the gory heath, seeking, amid heaps of the wounded, the dying, and the dead, for the disfigured corpse of a loved and lost one, to be borne away for Christian sepulture—the last holy tribute of surviving affection!

Truly, then, was the beauty of the Lord's Day disfigured by a ghastly scene of strife and carnage,—of ruthless cruelty and murder; sadly was its holiness interrupted by a mingled cry—not of humility and thank-giving, of humble hope and penitential prayer, but of a loud and discordant sacrifice, piercing to the very arch of heaven, wherein were distinguished no sounds but those of lamentation, and mourning, and woe.

As William was engaged in his tent, dispensing commands and instructions to his followers, he was told that two monks of the Abbey of Waltham craved an audience; he ordered them to be admitted, and Osgood Cneppe and Ailric de Childemaister were brought before him.

"Now, sirs," said William sternly, for he never loved an English ecclesiastic, "what would you?"

"Permission to search for and bear away the corpse of our king."

"Your king! By the splendour of heaven, but ye are bold men to name your forsworn usurper to me, his liege lord! Begone!"

With gushing tears and dejected mien one of the monks was turning away in obedience to the mandate, but the other seemed to gain energy even from the uncourteous treatment he received.

"Lord of Normandy," said Ailric, "Heaven hath given thee the victory, but beware that ye abuse not its bounties. Such hap may not always be thine; be thou therefore merciful, even as thou hopest for mercy in thine own hour of peril. Insult not a fallen foe."

"By the mass, monk, but thou speakest boldly! What wouldst thou?"

"Justice!—nought do we seek at thy hands but justice. According to the laws of warfare the body of the Lord Harold is thine; we come to ransom it."

"Ha!" exclaimed the king, who was avaricious in the extreme, "what offer ye?"

"The weight of the body in virgin gold."

"By all the saints! but that is more than a king's ransom; the Aves and Paternosters of thy abbey must be rated highly, monk, since they yield such golden profits."

"Insult not Holy Church through us, even though we be the meanest of her ministers," said Ailric sternly; "nevertheless, though we might well lay down all the little wealth of our abbey for him to whose piety we owe its existence, still know that not one cross of this ransom is offered by us."

"By whom, then?"

"By the broken-hearted mother whom thy ambition has rendered childless;—by the noble Lady Githa!"

There was a sudden pause: the countenances of those around had, from the first, evinced regret and disapprobation of the duke's harshness; but now he was himself struck. His voice was still harsh, but oh! how different in its tones.

"Go! get ye gone: do what ye list."

"And the ransom, Seigneur?"

"Speak not of it," said he, turning hastily away: "get ye gone!"

Thus authorized, the monks proceeded to their melancholy search, but it was in vain. For long and weary hours did they pace the scene of the recent carnage, peering anxiously amid the heaps of slain for some

token of him they sought. Often did their very souls sicken within them as they shudderingly turned over disfigured corpses, which even already gave loathsome symptoms of corruption, or more horrible tokens that the ghoul of the animal creation had already scented its prey. But worse,—far worse than all this, was it to meet with some wretched sufferer who still breathed, or some who had even power to murmur his misery, and yet be compelled to refuse him aid, lest in that precious moment some unauthorized hand should bear away their king. How often in this weary quest did the good men dash the blinding tears from their eyes, and groan as if their very hearts were rent with the sight and sound of the misery around them.

But it was in vain,—all in vain; and almost in despair the monks beheld the sun already past the meridian, and yet they had been unable to recognise the object of their search.

"It is hopeless, brother,—it is hopeless; and yet to relinquish our mission—"

"Must not be thought of," interrupted Ailric; "but I have bethought me of a plan,—what if we were to bring hither the Lady Editha?"

"Impossible," said Osgood. "It is no scene for a gentle heart."

"And think you," rejoined Ailric, "that the mourners who have been hovering around us all day in quest of slaughtered relatives have not hearts as kind and feelings as tender as her of the Swan's Neck, though they be not robed in silk and minever? Affection is of no rank, brother, nor does firmness of mind inhabit only the rudely built frame; and if I read the Lady Editha's character aright, she would dare even this fearful scene rather than her loved lord and husband should lack a holy grave. Shall we to her?"

"Yes: you are in the right, I doubt not."

The beautiful Lady Eddeva, or Editha, called, from her fairness and surpassing dignity, Swanescombe, or Swan-necked, was the second wife of Harold,¹ and was devotedly attached to him. At once, and without a moment's hesitation, though well-nigh convulsed with grief, she folded her veil more closely around her, and accompanied the monks to the field of strife. For some time she paced it firmly, resolutely; and swallowing, her tears, cast keen and searching glances around. But shortly her strength and spirit seemed to fail, and she was compelled to lean on one of the monks. Still they proceeded, but slower and more slowly, till at length, sick at heart, and almost hopeless, it was only by the strenuous support of both the holy men that she could be got forward at all. Feeling that she sank more and more, that every moment her weight on their arms was increasing, they endeavoured to draw her aside from the thick of the slaughter, and turned into a little glade beneath the hollow of a hill, meaning to lay her there for a few moments till the deathlike sickness which was visible in her countenance should have passed away. Forgetful at this moment of every thing but their fair burthen, the monks perceived not that the place was occupied. Some sudden movement on their parts caused her to open her eyes, and she looked languidly and almost unconsciously around, when suddenly, with supernatural strength and a piercing scream, she darted from her supporters, and rushing to the hollow, threw herself on the ground, and clasped closely the body of a warrior which was laid there, watched by reverently by a person in humble attire.

"Whom have you here?" asked the horror-stricken monks.

"THE KING," replied he, with the deepest dejection of tone and manner.

And so it was. In wandering over the field he had recognised the body of the fallen monarch close by the spot where the royal standard had been planted, and,

from reverential regard, though without any definite purpose, he had borne away the body from the undistinguished throng. After Editha had thrown herself on the ground, she gasped two or three times convulsively, but now lay motionless, as the monks supposed, in a swoon. They raised her gently, but her heart was broken. Editha of the Swan's neck was dead!

The harassed monks were now distressed indeed, and hardly knew what course to pursue: at length, however, having with difficulty gained some assistance, they prepared to bear away the body of the unfortunate Editha, committing the charge of the king—as they felt they safely might—to him who had so piously protected it, until they could return with further aid. Having carefully marked the spot, with heavy hearts they departed.

Shortly afterwards the franklin left in charge of the king, stooped over him to re-arrange some portion of his attire which was disordered, but whilst so engaged suddenly started to his feet with an exclamation of amazement. Again he stooped down, and placed his hand over the heart of the king. No—it was not fancy—there was a pulsation there—feeble indeed, as the faintest summer's breath which hardly stirs the gossamer, but still perceptible. The worthy Saxon raised the king, chafed his hands, his temples;—the signs of animation became indisputable.

When the monks returned to the spot, which they accurately remembered, the body of the king had been removed, and all further search proved vain.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. XIV.

THE MEET AT EVERLEY HORSE.

It had been arranged between my mother and Oaklands, in the earlier part of the evening on which the events described in the last chapter took place, that Fanny should have her first ride on the day but one following, by which time it was supposed that the habit would be fit for service, and the young lady's mind sufficiently familiarized with the idea, to overcome a rather (as I considered) unnecessary degree of alarm, which I believe would have led her, had she been allowed to decide for herself, to relinquish it altogether. The only stipulation my mother insisted on was, that I should accompany my sister in the character of chaperon, an arrangement to which, as it was quite evident that Lawless intended to form one of the party, I made no objection. Accordingly, on the day appointed, Oaklands made his appearance about ten o'clock, mounted on his favourite horse, and attended by a groom, leading the grey Arab which was destined to carry Fanny, as well as a saddle horse for me.

"Bravo, Harry! it does me good to see you and the 'Cid' together again," exclaimed I, patting the arched neck of the noble animal; "how well he is looking!"

"Is he not?" replied Oaklands, warmly; "the good old horse knew me as well as possible, and gave a sigh of pleasure when first I spoke to him. Is Fanny nearly ready?"

(1) Ellis, *Introd. to Doomsday Book*, vol. ii. pp. 79, 80.

(1) Continued from p. 327.

"She will be here directly," replied I; and the words had scarcely escaped my lips when she made her appearance, looking so lovely in her hat and habit, that I felt sure it would be all over with Lawless as soon as he saw her.

"Why, Fanny," exclaimed Oaklands, dismounting slowly and with effort, for he was still lamentably weak, "I have not seen you in a habit so long. I declare I should scarcely have known you; the effect is quite magical."

A smile and a blush were her only reply, and Oaklands continued, "Will you not like to mount now? Lawless will join us; but he means to abandon us again when we get near Eversley Gorse, for the superior attractions of a run with the subscription pack."

"Oh, I hope the hounds will not come in our way," exclaimed Fanny; "if you think there is any chance of their frightening my horse, I had better not ride to-day."

"I do not think you need feel the least alarm; though spirited, Rose Alba is perfectly quiet; besides, we are not bound to ride towards Eversley, unless you approve of doing so," replied Oaklands.

As he spoke, Lawless rode up just in time to catch the last few words. He was dressed in an appropriate hunting costume, and sat his horse (a splendid black hunter, whose fiery temper rendered all those in whom the bump of caution was properly developed remarkably shy of him) as easily as if he formed part of the animal. As he checked his impatient steed, and taking off his hat, bowed to Fanny, his eyes sparkling, and his whole countenance beaming with pleasure and excitement, he really looked quite handsome. The same idea seemed to strike Fanny, who whispered to me, "If ever your friend has his picture taken, it should be on horseback."

"Good morning, Miss Fairleigh!" cried Lawless, as, flinging the rein to a groom, he sprang from the saddle, and bounded towards us; "glad to see you in what I consider the most becoming dress a lady can wear,—very becoming it is too," he added, with a slight bend of the head to mark the compliment. "What did I hear you say about not riding to Eversley? You never can be so cruel as to deny me the pleasure of your company, and I must go there to join the meet. I would not have hunted to-day, though, if I had known you wished to ride in another direction."

"It was only that Fanny was afraid the hounds might frighten her horse," replied I.

"Oh, not the least danger; I'll take care of all that," returned Lawless; "the little white mare is as gentle as a lamb; I cantered her across the park myself yesterday on purpose to try—the sweetest thing for a lady I ever set eyes on. You have got some good cattle in your stables, Harry, I must own that."

"Hadm't we better think of mounting? Time will not stand still for us," observed I.

"Let me assist you, Fanny," said Oaklands, advancing towards her.

"Thank you," replied Fanny, drawing back; "but I need not give you the trouble; Frank will help me."

"Here, get out of the way!" cried Lawless, as I hesitated, fancying from the shade on Oaklands' brow that he might not like to be interfered with; "I see none of you know how to help a lady properly. Bring up that mare," he continued, "closer,—that's it; stand before her head. Now, Miss Fairleigh, take a firm hold of the pommel; place your foot in my hand—are you ready!—spring! there we are—famously done! Oh, you know what you are about, I see. Let me give you the rein—between the fingers; yes, the snaffle will manage her best; the curb may hang loose, and only use it if it is necessary; let the groom stand by her till I am mounted; the black horse is rather fidgety;—soh! boy, soh! quiet!—stand, you brute!—there's a good boy; steady, steady—off we go!"

As Lawless pushed by me at the beginning of this speech, Oaklands advanced towards him, and his pale

cheek flushed with anger. Apparently, however, changing his intention, he drew himself up haughtily, and turning on his heel, walked slowly to his horse, mounted, and reining him back a few paces, sat motionless as an equestrian statue, gazing on the party with a gloomy brow, until we had started, when, suddenly applying the spur, he joined us in a couple of bounds, and took his station at Fanny's left hand. Lawless having appropriated the off side, devoted himself to the double task of managing the Arab, and doing the agreeable to its fair rider, which latter design he endeavoured to accomplish by chattering incessantly.

After proceeding a mile or two, Lawless sustaining the whole burden of the conversation, while Oaklands never spoke a word, we came upon a piece of level green sward.

"Here's a famous place for a canter, Miss Fairleigh," exclaimed Lawless; "lean a little more towards me—that's right. Are you ready?—just tickle her neck with the whip—not too hard—jerk the rein slightly—gently, marc, gently!—there's a good girl, that's it! Eh! don't you see, she settles into her pace as quietly as a rocking-horse—oh! she's a sweet thing for a feather-weight;" and restraining the plunging of his fiery horse, he leaned over, and patted the Arab's arched neck, as they went off at an easy canter.

I was about to follow their example, but observing that Oaklands delayed putting his horse in motion, it occurred to me that this being the first ride he had taken since his illness, the exertion might possibly be too much for his strength, I waited, therefore, till he joined me, when I inquired whether he felt any ill effects from the unwonted exertion?

"No," was the reply. "I feel an odd kind of fluttering in my side, but it is only weakness."

"Had you not better give it up for to-day, and let me ride back with you? I dare say Lawless would not care about hunting for once, and would see Fanny home."

"I shall not go back!" he replied sternly; then checking himself, he added in a milder tone, "I mean to say it is not necessary—really I do not feel ill—besides it was only a passing sensation, and is already nearly gone."

He paused for a moment, and then continued, "How very dictatorial and disagreeable Lawless has grown of late, and what absurd nonsense he does talk when he is in the society of ladies! I wonder your sister can tolerate it."

"She not only tolerates it," returned I, slightly piqued at the contemptuous tone in which he spoke of Lawless, "but is excessively amused by it; why, she said last night he was quite delightful."

"I gave her credit for better taste," was Oaklands' reply; and striking his horse impatiently with the spur, he dashed forward, and in a few moments we had rejoined the others.

"I hope illness has not soured Harry's temper, but he certainly appears more prone to take offence than in former days," was my inward comment, as I pondered over his last words. "I am afraid Fanny has annoyed him; I must speak to her, and give her a hint to be more careful for the future."

Half an hour's brisk riding brought us to the outskirts of a broad common, a great portion of which was covered by the gorse or furze from which it took its name. Around the sides of this were gathered from sixty to eighty well-mounted men, either collected in groups, to discuss the various topics of local interest which occupy the minds of country gentlemen, or riding up and down in parties of two and three together, impatient for the commencement of their morning's sport; while, in a small clear space, nearly in the centre of the furze-brake, were stationed the hounds, with the huntsman and whippers-in.

"There!" exclaimed Lawless, "look at that! Talk about operas and exhibitions!—where will you find an exhibition as well worth seeing as that is? I call that

a sight for an Empress. Now are not you glad I made you come, Miss Fairleigh?"

"The red coats look very gay and picturesque, certainly," replied Fanny; "and what loves of horses, with their satin skins glistening in the sunshine! but I wish those Alba would not prick up her ears in that way; I'm rather frightened."

While Lawless was endeavouring to convince her there was no danger, and that he was able and willing to frustrate any nefarious designs which might enter into the graceful little head of the white Arab, a young man rode up to Oaklands, and, shaking him warmly by the hand, congratulated him on being once more on horseback.

"Ah, Whitcombe, it's a long time since you and I have met," returned Harry; "you have been abroad, I think?"

"Yes," was the reply; "Charles and I have been doing the grand tour, as they call it."

"How is your brother?"

"Oh, he's all right, only he has grown a great pair of moustaches, and won't cut them off; he has taken up a notion they make him look killing, I believe; he was here a minute ago,—yes, there he is, talking to Randolph. Come and speak to him, he'll be delighted to see you."

"Keep your eye on Fanny's mare," said Oaklands, as he rode past me, "she seems fidgety, and that fellow Lawless is thinking more about the hounds than he is of her, though he does boast so much of the care he can take of her. I shall be with you again directly."

"Do you see the gentleman on the bright bay, Miss Fairleigh?" exclaimed Lawless; "there, he's speaking to Tom Field, the huntsman, now; he has got his watch in his hand:—that's Mr. Rand, the master of the hounds; you'll see some fun directly. Ah! I thought so."

As he spoke, at a signal from the huntsman, the hounds dashed into cover, and were instantly lost to sight in a waving sea of gorse, save when a head or neck became visible for a moment, as some dog more eager than the rest sprang over a tangled brake, through which he was unable to force his way.

"Oh, you beauties!" resumed Lawless, enthusiastically, "only watch them; they're drawing it in first-rate style, and there's rare lying in that cover; now see how the furze shakes—look at their sterns flourishing; have at him there—have at him: that's right, Tom—cheer 'em on, boy—good huntsman is Tom Field—there again!—a fox, I'll bet 500*l.* to a pony—hark!—a whimper—now wait—a challenge! another and another—listen to them—there's music!—watch the right-hand corner—that's where he'll break cover for a thousand, and if he does what a run we shall have! Look at those fools," he added, pointing to a couple of cockney-looking fellows who were cantering towards the very place he had pointed to, "they'll head him back as sure as fate,—hold hard there—why does not somebody stop them? By Jove, I'll give them a taste of the double thong when I get up with them, even if it's the Lord Mayor of London and his brother. Look to your sister, Frank, I'll be back directly."

"Wait one minute," shouted I, but in vain, for before the words were well out of my mouth, he had driven the spurs into his eager horse, and was galloping furiously in the direction of the unhappy delinquents who had excited his indignation. My reason for asking him to wait a minute was, that just as the hounds began drawing the cover, I had made the agreeable discovery, that the strap to which one of my saddle-girths was buckled, had given way, and that there was nothing for it but to dismount and repair the evil; and I had scarcely concluded the best temporary arrangement I was able to effect, when Lawless started in pursuit of the cockneys. Almost at the same moment a countryman, stationed at the outside of the gorse, shouted "Tally-ho!" and the fox broke cover in gallant style, going away at a rattling pace, with four or five couple of hounds on his traces. In an instant all was

confusion, cigars were thrown away, hats pressed firmly down upon the brow, and, with a rush like the out-burst of some mighty torrent, the whole field to a man swept rapidly onward.

In the meanwhile Fanny's mare, which had for some minutes shown symptoms of excitement, pawing the ground with her fore-foot, pricking up her ears, and tossing her head impatiently, began, as Lawless rode off, to plunge in a manner which threatened at every moment to unseat her rider, and as several horsemen dashed by her, becoming utterly unmanageable, she set off at a wild gallop, drowning in the clatter of her hoofs Fanny's agonized cry for help. Driven nearly frantic by the peril in which my sister was placed, I was even yet prevented for a minute or more from hastening to her assistance, as my own horse, frightened by the occurrences I have described, struggled so violently to follow his companions, as to render it very difficult for me to hold; and quite impossible to remount him: so that when at length I succeeded in springing on his back, the hounds were already out of sight, and Fanny and her runaway stood so far ahead of me, that it seemed inevitable some accident must occur before I could overtake them, and it was with a sinking heart that I gave my horse the rein, and dashed forward in pursuit.

The course which Lawless had taken when he started on his wild-goose chase, was down a ride cut through the furze, and it was along this turfy track that those Alba was now hurrying in her wild career. The horse on which I was mounted was a young thorough bred, standing nearly sixteen hands high, and I felt certain that in the pursuit in which I was engaged, the length of his stride would tell, and that eventually we must come up with the fugitives, but so fleet was the little Arab, and so light the weight she had to carry, that I was sorry to perceive I gained upon them but slowly. It was clear that I should not overtake them before they reached the outskirts of the common, and then who could say what course the mare might take,—what obstacles might not be in her way!

On—on, we go in our headlong course, the turf re-echoing to the muffled strokes of the horses' feet, while the furze, waving in the wind, seemed to glide by us in a rapid stream. Onward,—still onward; the edge of the gorse appears a dark line in the distance.—It is passed; we are crossing the belt of turf that surrounds it, and now in what direction will the mare proceed?—Will she take the broad road to the left, which leads again to the open country by a gentle ascent, where she can be easily overtaken and stopped, or will she turn to the right, and follow the lane which must take her across the terrace-field to the brook, swollen by the late rains into a river? See!—she slackens her pace.—she wavers, she doubts, she will choose the road! No; by Heaven! she turns to the right, and dashing down the lane like a flash of lightning, is for a moment hidden from view. But the space of time, short as it was, when her speed slackened, has enabled me to gain upon her considerably; and when I again catch sight of her, she is not more than fifty yards ahead. Forward! good horse,—forward! Life or death hangs upon thy footsteps. Vain hope! another turn brings us in sight of the brook, swollen by the breaking-up of the frost into a dark, turbulent stream. Fanny perceives it, too, and utters a cry of terror, which rings like a death knell on my ear. There seems no possibility of escape for her,—on the left hand an impenetrable hedge, on the right a steep bank, rising almost perpendicularly to the height of a man's head, in front the rushing water, while the mare, apparently irritated to frenzy by my pursuit, gallops wildly forward.—Ha! what is that? a shout! and the figure of a man on horseback appears on the high ground to the right, between Fanny and the stream. He perceives the danger, and if he dare attempt the leap from the bank, may yet save her. Oh! that I were in his place. Hark! he shouts

again to warn us of his intention, and putting spurs to his horse, faces him boldly at it; the horse perceives the danger, and will refuse the leap.—No! pressed by the rider, he will take it yet—now he springs—it is certain destruction. A crash!—a fall! they are down! No; he has lifted his horse with the rein—they are apparently uninjured. Rose Alba, startled by the sudden apparition, slackens her pace—the stranger, taking advantage of the delay, dashes forward, seizes the rein, and succeeds in stopping her; as he does so, I approached near enough to recognise his features.

Unlooked-for happiness! Fanny is saved, and Harry Oaklands is her preserver!

My first act on joining them was to spring from my horse and lift Fanny out of the saddle. "Are you really unhurt, my own darling?" exclaimed I; "can you stand without assistance?"

"Oh yes!" she replied, "it was only the fright—that dreadful river—but—" and raising her eyes timidly, she advanced a step towards Oaklands.

"But you would fain thank Harry for saving you.—My dear Harry," continued I, taking his hand, and pressing it warmly, "if you only knew the agony of mind I have suffered on her account, you would be able to form some slight idea of the amount of gratitude I feel towards you for having rescued her. I shudder to think what might have been the end had you not so providentially interposed—but you do not listen to me—you turn as pale as ashes—are you ill?"

"It is nothing—a little faint, or so," was his reply, in a voice so weak as to be scarcely audible; and as he spoke, his head dropped heavily on his shoulder, and he would have fallen from his horse had not I caught him in my arms and supported him.

Giving the horses into the custody of a farming lad, who had seen the leap, and run up, fearing some accident had occurred, I lifted Oaklands from his horse, and laying him on the turf by the road-side, supported his head against my knee, while I endeavoured to loosen his neckcloth. Neither its removal, however, nor the unfastening his shirt-collar, appeared to revive him in the slightest degree, and being quite unaccustomed to seizures of this nature, I began to feel a good deal frightened about him. I suppose my face in some degree betrayed my thoughts, as Fanny, after glancing at me for a moment, exclaimed, wringing her hands in the excess of her grief and alarm, "Oh! he is dead—he is dead—and it is I who have killed him!" Then, flinging herself on her knees by his side, and taking his hand between both her own, she continued, "Oh, Harry, look up—speak to me—only one word—he does not hear me—he will never speak again! Oh! he is dead!—he is dead! and it is I who have murdered him—I, who would gladly have died for him, as he has died for me." As she said this, her voice failed her, and, completely overcome by the idea that she had been the cause of Harry's death, she buried her face in her hands, and wept bitterly.

At this moment it occurred to me that water might possibly revive him, and rousing Fanny from the passion of grief into which she had fallen, I made her take my place in supporting Oaklands' head, and running to the stream, which was not above fifty yards from the spot, filled my hat with water, sprinkled his face and brow with it, and had the satisfaction of seeing him gradually revive under the application.

As consciousness returned, he gazed around with a bewildered look, and passing his hand across his forehead, inquired, "What is all this? where am I? Ah! Frank, have I been ill?"

"You fainted from over-exertion, Harry," replied I, "but all will be well now."

"From over-exertion?" he repeated, slowly, as if striving to recall what had passed; "stay, yes, I remember, I took a foolish leap; why did I do it?"

"To stop Fanny's mare."

"Yes, to be sure, the water was out at the brook, and

I thought the mare might attempt to cross it; but is Fanny safe? Where is she?"

"She is here," replied I, turning towards the place where she still knelt, her face hidden in her hands. "She is here to thank you for having saved her life."

"Why, Fanny, was it you who were supporting my head? how very kind of you! What! crying!" he continued, gently attempting to withdraw her hands; "nay, nay, we must not have you cry."

"She was naturally a good deal frightened by the mare's running away," replied I, as Fanny still appeared too much overcome to speak for herself; "and then she was silly enough to fancy, when you fainted, that you were actually dead, I believe; but I can assure you that she is not ungrateful."

"No, indeed," murmured Fanny, in a voice scarcely audible from emotion.

"Why it was no very great feat after all," rejoined Harry. "On such a juniper as the Cid, and coming down on soft marshy ground too, I would not mind the leap any day; besides, do you think I could remain quietly there and see Fanny drowned before my eyes; if it had been a precipice, I would have gone over it." While he spoke, Harry had regained his feet; and, after walking up and down for a minute or so, and giving himself a shake, to see if he was all right, he declared that he felt quite strong again, and able to ride home. And so, having concocted a leading-rein for Rose Alba, one end of which I kept in my own possession, we remounted our horses, and reached Heathfield without further misadventure.

THE NYMPH OF THE FOUNTAIN.

A FAIRY TALE.

MAUD now thought that all her trials were over, and for a time her happiness was perfect. Her husband became daily more attached to her, and she every day saw more reason to value his love. In every thing they acted together—their amusements, their duties, their charities, their prayers: and Maud felt few pleasures so great as that of being able not only to go among the poor again, but to give, with a liberal hand, and a judgment improved by all she had herself experienced of the lot of the poor. Count Henry never checked her in this,—he loved her the more for her goodness; and time passed rapidly away. Her only sorrow was caused by the death of Dame Gottfried, whom she tenderly cared for during her illness, and really regretted. At length Maud found that she was soon to become a mother, and the count's joy was very great. On hearing this news the old countess proposed a reconciliation, which Maud readily accepted, and persuaded her husband to agree to. As a proof of her good will, the dowager offered to come and stay with Maud during her confinement, and though this was by no means pleasant to her (for the Lady Hildegard was excessively haughty and exacting), Maud saw that her husband wished it, and immediately consented.

The count's anxiety for her welfare, as the time approached, endeared him more and more to his wife, and she looked forward with delight to the happiness she should feel in putting his first-born child into his arms. But just the day before her illness he was unexpectedly summoned to attend a great meeting of the nobles of the country, and forced to leave her, for the first time

since their marriage, at the very moment when he most wished to watch over her. The day after his departure Maud had a son, a fine healthy child: her happiness was damped only by knowing her husband's anxiety for her, and by reflecting that several days must elapse before he could return. She sent him a messenger to announce the good news, and, for the first two days, her recovery went on well. But as she was sleeping the second night, Countess Hildegard, who had given her opium, to ensure her not waking, took the child gently from her arms, carried him, unseen by all except the nurse, on whom she knew she could depend, to a window in the anti-room, and threw him into the river, which flowed under the castle walls. She had pretended reconciliation only to have the power of injuring Maud, whom she could not forgive, and she thought nothing would so cool Count Henry's love as the loss of his much-wished-for child; especially as she hoped to throw suspicion on Maud herself.

The agony and terror of the poor young countess on awaking and missing her child may be imagined. It nearly cost her her life; and when her husband returned, full of joy, and eager to embrace her and his little son, he found her in the delirium of fever, and almost at the brink of the grave. He made every possible inquiry and examination into the fate of his child, but in vain; no trace could be found. The nurse asserted that she had laid it quietly in its mother's arms, had seen the countess asleep, and had dropped asleep herself, being tired with the previous night's watching. This was false, for she was the creature of the dowager countess, and knew perfectly well what had been done; but she had a special enmity against poor Maud, because her father had been ruined, years before, by the exactions of the old baron, who seized him as he was travelling near his castle, and not only plundered him of all his goods, but made him pay a heavy ransom before he set him free. This nurse and the old countess tried to insinuate that Maud might know more of the disappearance of the child than any one else, but nothing would persuade Count Henry of this. His love and watchfulness contributed much to poor Maud's recovery, but it was long before she was restored to health and spirits. She endeavoured to check her grief, that she might not add to her husband's sorrow, but it was not till she had hopes of being once more a mother that she felt at all as she had done in the first year of her marriage. She had sought for her musk-ball, as soon as she was able to move about, after her illness—but in vain; she could not remember where she had put it, when her husband's dislike to the smell made her give up wearing it: all she could recollect was that it was in a secret drawer of some cabinet, but she tried all, again and again, without success. She bitterly regretted having neglected, for any motive, her god-mother's advice of carrying it always about her, but it was too late, the fairy gift seemed finally lost.

Nearly two years had passed away after the loss of her child before her second confinement approached. She and her husband had resumed their former habits, and, but for the heavy sorrow they had both undergone, Maud's life would have been as happy as in the beginning of her marriage, for the count's affection was undiminished, and his attention to her, if possible, fonder than before. The Countess Hildegard again offered to come to her, and Maud ventured to express her wish to be alone with her husband, but he urged her to accept his stepmother's offer, for he thought it right to have as many as possible of his family in the castle, that Maud might never be alone one moment. He did not forget Countess Hildegard's hints of suspicion, which Maud had never known, for he would not pain her by such an idea; and he imagined that nothing would so dissipate any remnant of them she might still entertain, as beholding Maud's strong attachment to her child. He promised his wife that he would, himself, watch over her, and she yielded to his wish.

This time she had the satisfaction of seeing her husband's delight in welcoming a daughter, but very soon after the child's birth, a messenger came, in all haste, to inform him that a troop of marauders had besieged a castle of his, at a considerable distance, and that he must not lose a moment in leading his soldiers to the assistance of the garrison. Most unwillingly he took leave of his wife, promising to return without delay; but four or five days at least must pass before he could hope to be with her again. Poor Maud felt her heart sink, with a foreboding of evil, as he quitted the room. She clasped her little girl in her arms, and promised herself that she would not lose sight of her till the count's return. She resisted sleep as long as she could, but at length it overpowered her, the more completely because the Countess Hildegard had again administered a sleeping potion. But Maud had folded her arms round the baby so closely that the wicked woman found much difficulty in removing it. However, she succeeded, and again threw the poor infant into the river. Before Maud awoke the count had returned, quite unexpectedly: he had found the whole a false alarm, and could not even trace the messenger who had brought the news, though the man had for some distance accompanied the reinforcement; how or when he had left them no one was sure. When Count Henry reached his castle all was at peace, no attack had been thought of—no express sent to him! He put his troops under the command of a relation to lead them home at leisure, while he himself mounted a fresh horse, and, accompanied only by his esquire and page, returned home with the utmost speed, full of foreboding, from the trick evidently employed to secure his absence.

A sad welcome awaited him. Maud was roused by the noise of his entrance—and instantly missed her child. Her shrieks and tears were heart-rending: but again every effort to ascertain its fate was fruitless—no one was in the secret but Countess Hildegard and the nurse, who pretended the utmost attachment to her young lady, and protested she could not at all imagine how the child had disappeared, as she had never left the bed-side. It was altogether inexplicable, and the count might have been shaken in his high opinion of Maud, if he had not himself seen her surprise and agony on waking, and felt convinced that it was real. He smothered his own bitter grief that he might soothe hers—and again, by his tenderness and care, rescued her from the grave she was almost sinking into.

Time passed on, and they had settled into nearly their former way of life, except that they mixed less in society, and gave still more of their time to prayer and charity. Maud's spirits were broken a good deal, though she tried to be cheerful in her husband's presence. The Countess Hildegard had remained in the castle, saying she could not leave them in their sorrow; and though Maud could not like one whose habits were so different from her own, she was a good deal deceived by the old lady's show of sympathy, and was glad to please her husband, who evidently wished for the dowager's presence, as a proof that, proud and at feud as she was known to be, she was won over by the excellence of the wife he had chosen. At length Maud was, for the third time, to be a mother; and, with trembling hope, she trusted that this child, at least, might be spared to her, by extreme watchfulness. But, just as the time approached, the count was summoned to attend a council of the empire, held to decide upon measures of great importance to its internal peace and outward defence. He at first sent an excuse, but the summons was peremptorily repeated, and his friends represented to him that a noble of his rank could not hold back without seriously impeding the proceedings: so he most unwillingly set out. Maud would gladly have gone with him, for she felt a kind of presentiment that her only safety was at his side, but it was impossible for her then to undertake such a journey; so, with heavy hearts, they parted.

The count had some hopes that the business might be finished more quickly than was supposed, or at least that he might be allowed to return home for a short time, under promise of rejoining the emperor if necessary, for he was determined to do his utmost to be with his wife during the first days after the baby's birth, that he might endeavour to protect it from the mysterious danger which had robbed them of their two eldest. In this, however, he was disappointed: it was not for some days after he learned that he had another son that he was enabled to set out for home, and then his stay was to be but short. He travelled as speedily as possible, but the black flag waved over his castle as he approached, and his step-mother met him in the great hall to announce that the child was indeed dead, but that she had discovered the destroyer! The poor count's grief, great as it was, only made him the more eager to learn who had caused such bitter sufferings. But when the old countess said, "It is no other than Maud herself, whose well-feigned anguish and pretended virtues have so long imposed upon you, though my suspicions were never entirely lulled," he sank into a chair, and, burying his face in his hands, he could not restrain his tears. Instantly rousing himself, however, he demanded the proofs.

Countess Hildegard replied that, pretending extreme fear for the child, Maud had long watched it, without allowing herself to close her eyes, but at last, finding herself overpowered with sleep, she had made the nurse bring her a thick gold chain, which the count had lately given her, and had twined it several times round her own neck and the child's body, and had then appeared to drop asleep, saying she was sure no one could remove the infant without waking her. That the nurse had remained by the bedside, but soon fell asleep also; and to a degree she could not understand, as she was used to night watching. But after events made her suspect that some sleeping draught must have been put into the ale she had taken at supper, of which, fortunately, she had drunk but little. That she was gradually beginning to doze, in spite of her utmost efforts, when she perceived Maud move, and in a cautious way, which induced her to feign sleep, remembering the suspicious Countess Hildegard had expressed on the death of the first child. But she watched from under her eyelids: and Maud rose from the bed, with a strength that astonished the nurse, took a pair of large scissors, with which she cut the links of the chain that bound the child to her, and, with a sharp bodkin, she pierced the infant to the heart! The nurse was so paralyzed with horror, and with fear of the consequences to herself if her watching were discovered, that she dared not move till the crime was complete; and then she thought it best to ascertain what could be Maud's object,—what she would do further: so she continued in apparent sleep, and saw the child's body carried to the fire, and burnt; the bones and ashes were then placed in a box, which the wicked Maud drew from under her bed; all, except a small pinch, which she mingled with a little water, and drank, first pronouncing some words over it, which convinced the nurse that it was done as a charm to secure her husband's affection. Maud then laid down again in bed, carefully arranging the chain so that it should appear to have been cut as she slept, in order to remove the infant without waking her. The nurse waited till she was quite sure that the sleep the countess immediately fell into was real, and then stole from the room, pale and trembling, to tell her tale of horror to Countess Hildegard. "I rushed to the room, followed by several domestics," she continued, "woke the infamous creature, who was really asleep, notwithstanding her abominable crime, and charged her with it. She burst into shrieks and exclamations, such as you heard when the second was missed, held up the links of the severed chain to prove how carefully she had guarded her infant, and protested her innocence in terms that almost shook my belief in the nurse's evidence. But I thought it

right to search if the box of bones and ashes were under the bed, as, if it should not be there, one part, at least, of the nurse's dreadful story was false, and I might venture to disbelieve the rest. But alas! the box was there, and full, as nurse had said, of fragments of bones and of ashes! I could doubt no more. I silenced the witch's cries and protestations, by calling in the rest of the household, and showing them what I had discovered, and I had her carried down to the dungeon, where she has since remained, with bread and water for her food. I would not have her put to death, however much she might deserve it, till you should return; though many have thought me imprudent in this, as her spell, which has hitherto so blinded you, might still have power. But I wonder you did not meet the messenger I despatched at once to tell you all that had occurred."

The count had sat, during this recital, with his face buried in his hands: as the Countess Hildegard ended, he commanded himself and ordered the nurse to be sent for. He had a shade of hope that her story might yet be false, from the almost incredible circumstance of her not having interfered to save the life of the child. But no questioning could shake her evidence; she alleged her excessive terror as the excuse, and in only repeating the story she turned so pale, and trembled so, that it was plain she had not a spark of courage. Then the count demanded to hear some of those who had seen the box drawn from under the bed, and found them all satisfied of the truth of the whole, and most eager that the three-fold murder—for who could now doubt that all were Maud's own work?—should be avenged by the death of her who had committed them. The bones and ashes had been buried, Countess Hildegard said, with the honours due to the remains of a member of the family.

"She must die!" said the count, at length. "I will not see her again—I could not bear it—and perhaps her beauty, and seeming innocence, and the remembrance of past days, when I so loved her, might sway me even yet, though her guilt is manifest. But I cannot have her tortured, nor shall her death be public: let her be smothered in a hot bath."

Accordingly poor Maud was lifted from the dungeon pallet, where she lay almost dead of grief and exhaustion. She had struggled against her sufferings, and prayed to live till her husband's return, trusting that he would discover and assert her innocence; for it is needless to say that the whole story of the murder was arranged between the Countess Hildegard and the nurse; that, in truth, the chain had been cut by them while Maud slept the heavy sleep of exhaustion, from her long watching, combined with the effect of opium: and the baby thrown into the river, from the same window whence the two former ones had been cast. The dowager had resolved not to trust, this time, to the mere disappearance of the infant; she prepared all her proofs; had a box of the bones and ashes of a kid placed under the bed, and took care that the most credible persons in the castle, and those most warmly attached to Maud, should be present at the discovery. One can hardly wonder that they were deceived, for the belief in charms and spells was common in those days; nor has it, even now, by any means disappeared, even in England; and the ashes of an unbaptized infant were supposed to have particular power, above all, in obtaining or preserving love;—the very purpose to which the old countess attributed Maud's crime.

When the soldiers entered the dungeon, and informed Maud that the count had returned, and had sentenced her to death, she would hardly believe that he had condemned her unheard; but she was, of course, unable to resist, and she let herself be carried to the fatal bath, resigning herself to die, and praying for the forgiveness, not only of her beloved husband, but of those who had led him into such injustice. She was placed in the bath, and the door was fastened. At first the heat was pleasant to her benumbed limbs; but

soon it grew unbearable, and she screamed with agony—the more bitter to hear, from its seeming a fresh cruelty on her husband's part. But he had meant that she should be suffocated, and it was by the Countess Hildegard's contrivance that the heat was first so applied as to cause the most intense pain, without destroying life. Just as poor Maud was gathering her strength to rush against the door, hoping she might burst it open, and at least force them to put her to an easier death, she perceived, in a corner of the little bath-room, which was not the one she habitually used, an old cabinet, which she knew used to stand in her bed-room. How it had got there she could not conceive, nor how long it might have been there; but the recollection suddenly struck her, that this was the very place where she had put her musk-ball, when her husband's fancy made her lock it up. She burst the secret drawer open, and seized the ball, which her strong pull at once brought to view;—it seemed to have been buried under other things in her former searches, for the drawer was full, and she felt almost sure she had looked in it before. However, she rapidly unscrewed it, repeating the words which had before saved her life:—

"Behind me night, before me day;
That none observe my secret way."

and immediately she was surrounded by the cooling vapour she so well remembered, and found the door opened at her touch. She walked, quite unseen, to her bed-room, which was wholly empty, and throwing a large cloak around her, she seated herself, for she could hardly stand, from weakness and anxiety. She then completely unscrewed the ball, rejoicing that her third wish still remained, and wished that her innocence might be proved to her husband, and their children restored, if they yet lived, or, if not, that the authors of such dreadful misery might be discovered.

As she ended her wish, a window, which looked towards the river, opened, and her godmother entered, carrying the baby in her arms, and followed by the two elder ones. With an affectionate kiss she greeted Maud; told her that her trials were now ended; that by her fairy power she restored her to health and strength; and that, as soon as she was dressed, she would guide her to her husband, to whom the existence of the children would sufficiently prove her innocence, and before whom only the authors of the conspiracy should be pointed out.

Maud's toilette was very quick, as may be imagined; and the Nymph of the Fountain led her to the castle chapel, still unseen by any. There Maud found her husband, alone, and in an agony of grief, prostrate before the altar. She knelt a moment, to return her heartfelt thanks to heaven for her wonderful deliverance, and to beg help to pardon the enemies whose wicked plots had been defeated, and were now to be unravelled; and then she went towards the count, and called him by name. He started up at hearing the voice of her he had so deeply loved, and whom he thought already dead by his own necessary command; for on him, as on other feudal lords, devolved the administration of justice in his own domains. But when he beheld her in perfect health, and with all their long-mourned children round her, his astonishment was unutterable, and he thought, for a moment, she must be a spirit returned from the other world. But the Nymph of the Fountain seemed to them to follow her, and as soon as they had left the chapel, she told the count that she was the godmother his excellent wife had so often spoken of, and related to him the entire plot. She said that the queen of the Naiads had forced her to abstain from seeing her charge, just about the time when Maud's misfortunes began, partly to punish her for leaving neglected some of her duties in her excessive care of Maud's education, and partly to try if that education had been really good; that it was only since their marriage she had been allowed to inhabit the

river which flowed under the castle walls, and that she had received and taken care of each of the children, but could not come to Maud's help, till she should be summoned by the third wish. She had known of the treachery of Countess Hildegard and the nurse; and she now explained its entire details, not forgetting the forged message which had drawn the count from home at the time of his daughter's birth. It was a trick of the malicious old countess, who knew that it would be impossible for her to execute her plans if he were with his wife. Public events had spared her the trouble on the two other occasions, or she would not have failed to contrive his absence, so bent was she on the destruction of Maud, the daughter of her feudal enemy,—the girl without fortune, and of scarcely equal birth,—who had prevented her step-son from forming the splendid alliance she had planned for him.

When the Nymph of the Fountain had finished speaking, the count, whose attention to her narrative had not been lessened by the fond caresses he bestowed on his recovered wife and children, begged she would accompany them into the great hall of the castle, where he summoned all his household, and informed them of the discovery he had made,—of the complete vindication of their much-loved lady, and of his determination to punish the false and cruel authors of so much misery. Maud earnestly implored him to pause; but it was not without much difficulty that she prevailed with him to be satisfied with confining his wicked step-mother and her accomplice, in a strong and solitary castle, for life. They did not very long survive the exposure of their guilt.

The next care of Maud and her husband was to have their children solemnly baptized, for all had been taken away before this ceremony had been performed, as the return of their absent father had been so quickly hoped for in each case. The christening was a magnificent festival, to which the whole neighbourhood flocked,—rich and poor: the rich to mark their respect for the count and countess, and the poor to share in the liberal alms which were distributed; and all alike to congratulate and sympathize in the happiness of those who were esteemed and loved by all ranks. The Nymph of the Fountain, to whom Maud owed so much, then took leave of her for ever, saying she would no longer need her protection, as she could foresee for both her and her husband a long and prosperous life, which should fully compensate both for the heavy trials they had endured so patiently and so well.

They did survive accordingly, to see a numerous and lovely family grow up around them, who distinguished themselves much in after life, and were as remarkable for their piety and charity, as for the courage and noble bearing which graced their high birth.

COUNTRY SKETCHES. — No. V.

THE ABBEY AND PARK OF WORMS.

To give a foreigner some idea of the fertile richness of England, no better spot could be selected to which to take him than one of the very beautiful parks of the nobility. He would there witness a combination of natural beauties, such as no other country in the known world can supply in anything like the same perfection. Trees whose growth has been coeval with the lapse of centuries, copses of brushwood and young plantations, wearing the most vigorous and healthy aspect—wide sheets of water, adorned by swans of graceful shape—a greensward redolent of thyme, and musical in its summer freshness with the voices of the grasshopper and wandering bee—now swelling into a gentle ascent, now lapsing into a forest dell, where that most aristocratic of animals, the agile and timid deer, lies couching in the feathery fern. Anon, an avenue of limes, some half

mile long, leading to the hall or mansion of the noble owner; these, with occasional glimpses, neither few nor far between, of cottage-roof and village spire, mingling with the vast and extensive prospect of arable and meadow land—these, ay, all these, would arrest his attention and excite his admiration. And these scenes of beauty are by no means rare; they occur throughout the several counties into which this island is divided. Although a kind of individuality serves to define them, yet each, in its way, possesses great and varied attractions. The little town of Woburn, in Bedfordshire, than which one more pleasantly situated does not gladden the eye of a traveller in any part of England, boasts the close contiguity of a demesne of vast extent, and full of those marked characteristics which we have been describing. The entrance from the park is through a plantation of evergreens, bounded on either side by two fine sheets of water. The firs and laurels are of great size, and form a pleasing contrast to the more open park, with its noble oaks and elms dotted here and there. After emerging from the grove, which winter and summer has the same green aspect, the road winds up a hill, and passes through a double avenue of trees. The abbey is soon in view. The park is a very extensive one, and has been stated to be twelve miles in its circuit. It contains some hundred head of deer, who form themselves into groups around the old trees, as though they were gifted with the art of pleasing, and availed themselves of every opportunity of showing their elegant forms to the greatest advantage.

In a secluded situation is a summerhouse and grounds, called the Thornery, which has a very pleasing and romantic effect when approached without previous notice. A fountain, flowers, shrubs, ornamental walks, doors of stained glass, handsome marble and stone ornaments, form part of the attractions of this pretty place; every way a suitable retirement for a duchess.

The principal entrance to the park is on the road from Hockliffe, to Woburn, through gilded iron gates, which lead to the west front of the abbey. The edifice is quadrangular, and presents the appearance of a truly comfortable and aristocratic home, without boasting any great architectural pretensions. The pediment of the western front has upon it the arms of the family, with their motto, "Che sarà sarà," and beneath are four columns of the Ionic order.

The abbey was founded in 1145, by Hugh Bolebeck, and belonged to the order of Cistercians. The manor of Mc-dineham was given to them by the founder, and the grant was confirmed both by King John and King Henry II. Property in Suaneburn and Murscle was bestowed upon them by one Hugh Malesch. But, without following out the fortunes of the monks at Woburn, or detailing what became of the order when Henry VIII. suppressed all institutions of a like kind, it may be interesting to remember, that the royal Elizabeth visited it in one of her progresses; and that Charles I. concealed himself within its precincts during the civil war. It would be an endless task to enter into a description of the great treasures of art which are here collected. In a ramble through the rooms, the eye is attracted by some fine specimens of the old masters, and by some beautiful examples of the modern English school. "Chevy Chase," by Landseer, finds in every lover of field-sports an attentive and observant gazer. The figures of Earl Percy, and the deer at bay, are particularly worthy of inspection. In the same room with this is Hayter's picture of the "Trial of Lord William Russell." This painting, so well known from the engraving of it by Bromley, is very interesting. The artist has been most happy in giving to the different individuals composing the *tableau* a defined and well-marked character, all their own. The light thrown on the devoted wife of Lord Russell is most skilfully managed; and the expressive face, with the body bent forward, speaks to the spectator most forcibly of a woman's high-souled heroic courage, showing itself the more strongly as the calls

for its endurance are greater and more trying. In a dressing-room is a portrait, by the same artist, of Lord John Russell: it is admirably executed, and is a most faithful resemblance. There are also a set of miniatures of the Russell family, by Bone, which are replete with interest, and which form the chief ornament of the state drawing-room. The saloon contains a fine Sir Joshua, being a portrait of the present duke's grandmother, the Marchioness of Tavistock, habited in her costume as bridesmaid to Queen Charlotte. Among the works of the old masters, "Our Saviour appearing to Mary Magdalen," by Annibale Caracci, is remarkable for the force of expression conveyed in the features of the astonished Mary. In such subjects this artist stands unrivalled. In an apartment, called the Venetian drawing-room, there are no less than twenty-four views in Venice, by Canaletti. The *Gran-Canale* is especially fine; and a view of the Rialto, as lifelike as painter's brush can make it. It is a great peculiarity in Canaletti's pictures, that the outline of the buildings is so carefully preserved; and the sea has, so to speak, such a Venetian look that the desolate yet noble city is presented to the imagination in a moment. Venice, as it was and as it is—what a contrast!—how mournful!—how striking! To turn from one of these representations of it to another, and so to view the whole series, is to be in Venice for the time, and associate with its Doges, its Council of Ten, its merchant-princes;—yet, all are gone! all past! mere actors in the pageantry of an era never more to be revived.

The picture-gallery is very long, and on its walls are hung a series of portraits of aristocracy and of royalty, from a very early period down to Fowler's picture of our present most gracious Queen. Of these, attention may be specially directed to Sir Antonio More's painting of Queen Mary and her husband Philip of Spain. There is a great deal of character in their faces, and Mary is drawn in an attitude which is indicative of that high command and absolute free will which ever dictated the deeds of "Mary the Queen," as she almost invariably signed herself. There is a portrait, by Zuccherro, of Sir Nicholas Bacon, and one, by Cornelius Jansen, of Sir Joceline Percy, one of the sons of Henry Earl of Northumberland, both most ably executed; and there is a relic of Horace Walpole's miscellaneous collection of curiosities,—a picture of the Duke and Duchess of Suffolk, Charles Brandon and Mary of France, sister of Henry VIII. It attracted great notice at the celebrated sale at Strawberry Hill, and has found a new home at Woburn. The head of Lord William Russell, by Riley, has a pendant beneath it of some interest to the historian, being the speech made by him before the unjust and fatal termination of his well-spent life. It would be wearisome to enumerate half the contents of this gallery; or to attempt to name the many pictorial arms scattered about in various parts of the mansion. The sculpture-gallery abounds in treasures of old Grecian and Roman art, which well deserve most minute investigation. Here are collected medallions in marble of the Roman Emperors, antique vases, cinerary urns, busts, and a variety of fragments of every kind of decorated sculpture. There is a very fine alto-relievo, by Thorwaldsen, on the subject of Achilles, Briseis, and the Heralds. Sir Richard Westmacott shines to great advantage in his exquisite Psyche, which is the perfection of modern sculpture. The classical outline of the features is admirably given, and the softness and delicacy of the figure are most remarkable. The busts of Lords Grey, Holland, and others, by Nollickens, are placed in conspicuous situations in a part of the building appropriated for their reception, and called the Temple of Liberty.

There is an inscription on an architrave in the portico of what is termed the Temple of the Graces which is from the well-known pen of a living poet; one whose cultivation and encouragement of every branch of the fine arts deserves to be held in high commendation, and

offers a noble example to future cultivators of the Muses who may be fortunate enough to be as liberally provided with this world's goods. It is scarcely necessary to name the poet Rogers:—

"Approach with reverence, there are those within
Whose dwelling-place is Heaven, daughters of Jove;
From them flow all the decencies of life;
Without them nothing pleases. Virtue's self
Admired, not loved. And those on whom they smile,
Great though they be, and beautiful, and wise,
Shine forth with double lustre."

The celebrated and beautiful group of the Graces, from Canova's chisel, attracts all eyes, and leads them to dwell upon its matchless beauties. It is in figures of refinement and delicacy that this sculptor excels; in manly and heroic forms, he loses by comparison with the northern artist, Thorwaldsen. Leaving the gallery of sculptures, it is a pleasant change to wander in the parterres and conservatories, filled as they are with a splendid collection of plants of every kind. The pinetum and araucaria house, contain valuable plants of the species *Abies* and *Araucaria*. The botanical house is rich in the possession of some magnificent specimens of the tribe of cactus. The palms and ferns are of great size, and grow to a prodigious height. Not the least agreeable pastime is to wander up and down through the tortuous intricacies of the labyrinth, composed of horn-beam, and crowned with a temple of Chinese fashion. To all these tasteful contrivances for passing away pleasant summer hours, there seems no termination. Not the least of their merit consists in their variety, and their excellent arrangement in the most picturesque positions. To leave them, however, without a word of comment on one of the choicest ornaments of the place, would be an injustice. The dairy at Woburn is too unique to be passed unnoticed, and claims a special note of admiration. It is a small structure of Chinese character, surrounded by water, on which the elegant water lily floats in graceful wreaths. The interior is well adapted for its uses and combines every convenience with its ornamental details. Nothing more perfect in its way can be conceived.

On the east side of the abbey, there is a group of trees, between whose aged trunks several village spires may be seen, all tending to form distinct and cheerful land-scapes of sylvan life. From another part of the park, the church at Woburn is a prominent feature in the view. A sense of something positively English prevails everywhere; and in no place is the impression disturbed or destroyed. The noble house of Russell has ever stood foremost through all our national history for the inherent nobility of its sons, a glorious race! illustrious for their achievements in the field and their greatness in the senate. Thus, wandering in the haunts where they so oft have trod, it is natural to muse and meditate on bygone years, and listen to the chimes of the old church, as they might have listened when called to prayer by the same sweet sounds, and where they pondered on the passing scenes of their eventful times. "Che sari sari,"—they have ever been a lofty branch of the aristocracy of England, and long may they continue to be so, and for years come to enjoy their leisure in the sweet precincts of Woburn.

Before quitting the neighbourhood, it may be recommended to the casual visitor to take a stroll through the cemetery of the church. Every grave, however humble, is kept in the most perfect order; and the intermixture of shrubs, rose-trees, flowers, with the marble and stone memorials of departed greatness, is happily suggestive of that land where all earthly distinctions are forgotten. One stone, commemorative of a girl of tender years, is worthy of remark. After relating the name and age of the deceased, the tribute to her memory is thus concluded—

"He builds too low who builds beneath the sky."

Never was Cowper's poetry more appropriately quoted;

and with this sweet sentiment lingering on the mind, we are consoled in bidding farewell to this charming locality.

MEMOIR OF PARMENTIER;

OR, THE INTRODUCTION OF THE POTATO AT PARIS.

ANTOINE AUGUSTIN PARMENTIER was born of poor parents, in the little town of Mondidier, in 1737. His father died during his infancy, and he was left to the care of his mother, a woman of superior character, and of admirable good sense, to whom he loved in after life to ascribe the highest advantages of his education. The old curé of the parish, who was the friend of his family, struck by the intelligence with which he received her early lessons, undertook to instruct him in the rudiments of Latin. At sixteen, Augustin, impatient to render some assistance to his mother, who, though honourably descended, was struggling with great poverty, entered into business under an apothecary in his native town, and the following year he went to Paris to one of his relations, who followed the same profession.

An opportunity soon offered for the young chemist to enter a career worthy of his ambition. The war with Hanover having broken out, Parmentier joined the army in 1757. The talent and the self-devotion which he displayed during the dreadful epidemic which so cruelly decimated the brave soldiers, whom the sword of the enemy could not conquer, soon raised him to the rank of second chemist; not only did the ardent and intrepid young man expose himself in the hospitals without fear, but he also frequently fought on the battle-field. He was taken prisoner five times, and he used to describe these mishaps, in later days, with his usual gaiety, and praise the skill with which the Prussian hussars had several times undressed him. "They were the cleverest valets," he said, "that he had ever met with."

During one of these military captivities, Parmentier conceived the first idea of the good deed which was destined to render his name immortal. Being subjected to rigorous confinement, and obliged to content himself with the rations of the prisoners of war, who were fed on potatoes; instead of complaining as the rest did of this food, which was new and disagreeable to them, he more wisely set himself to consider well the nature and the utility of the precious root, and determined not to forget it when he should recover his liberty: we shall see how he fulfilled his intention.

When peace was restored to his native country in 1763, Parmentier returned to Paris, where he attended the medical lectures of l'Abbe Mollet; those on chemistry delivered by the two brothers Douelle; and the botanical courses of the celebrated Bernard de Jussieu. His ardent love of learning led him to bear with cheerfulness the greatest privations, by means of which alone he was enabled to pay for his lessons, and to buy the books he wanted in the prosecution of his studies. And all this time he spared money to assist his mother and sisters, who little knew at how great a sacrifice of the comforts of life he thus contributed to the supply of their wants. In 1766, he was chosen from amongst many other candidates to fill the situation of assistant druggist at the Hôtel des Invalides, and in this new post he won all hearts by his zeal, his gentleness, and the charm of his affectionate and sprightly disposition. The old mutilated soldiers loved him for the interest he took in their past services, and in their welfare and comfort; and the good sisters who had the charge of the hospital loved him for the sympathy he showed in their anxieties and labours.

In 1769, Parmentier was rewarded by the appointment of senior chemist, which fixed him permanently at the Hôtel des Invalides. As soon as he began to taste the pleasures of ease and tranquillity, the remem-

branch of his imprisonment in Germany, and of the potato, recurred more vividly than ever to his mind. This useful vegetable had been brought into Europe from Peru in the early part of the sixteenth century, and was first cultivated in Italy and in Germany. It was introduced into France from Flanders, and was propagated in the south by the care of the great minister Turgot; it was used in the provinces of Anjou and Limousin, but ignorance and stubborn dislike to every innovation had prevailed in all other parts of the kingdom, and the plant was regarded as a subtle species of poison, that was calculated both to exhaust the soil in which it was grown, and to bring forth leprosy and other fearful maladies wherever it was used as an article of food. Such were the absurd prejudices Parmentier now resolved to attack with courage and perseverance. He knew how hard the strife must ever be against long-established custom and popular opinion; but he was animated by the purest philanthropy, and no obstacle seemed to him invincible in the path which should lead to the attainment of a national benefit. He saw that it would be necessary to obtain from the first some powerful protection for his plans, and he sought that of the king himself, Louis XVI., who gladly accorded it. He then determined to strike the imagination of the Parisians, and so to forge a weapon of his own, for his projected warfare against fancy and foolish superstition. For this end, he asked the monarch to bestow upon him fifty acres of the sterile plain of Les Sablons. They were cultivated now for the first time, under his directions and at his expense, and in due time were planted with potatoes. No sooner did the flowers appear, than Parmentier carried a nosegay of them to Versailles, and presented it to the king, who was surrounded by his court; Louis received the offering most graciously, and placed it in his button-hole, in spite of the scornful looks and the half-suppressed smiles of many who were present. From that time the cause of the potato was gained in the highest circles of Paris. The noble and the beautiful imitated the example of the monarch, and the potato blossom was worn instead of jasmine and roses in the most fashionable dresses of the day.

But while the great lords and ladies of the court hastened to the *Hôtel des Invalides* to offer their congratulations to the modest philanthropist at whose expense not a few jokes had been passed only a week before, it was still doubtful whether the people, for whose benefit he had chiefly been anxious to raise the plant, would be willing to profit by his pains.

The guards placed round his field by day increased the curiosity of the crowd, but they were withdrawn at night, and Parmentier heard with infinite satisfaction that his potatoes were stolen. He rewarded the first man that brought him tidings of this welcome theft, exclaiming, in the gladness of his heart, "If they are stolen by night, the old prejudice against them no longer exists."

Soon afterwards he gave a grand entertainment, at which Lavoisier and the American philosopher, Franklin, were present, amongst many of the most distinguished men of that time. Every dish consisted of potatoes dressed in an endless variety of form and fashion; even the liqueurs were extracted from the same precious root. It is only to be regretted that the bill of fare and the receipts of the cooks have not been preserved to the present day. Thus did the generous efforts of one man give to his fatherland an inestimable supply of wholesome food, and placed millions beyond the reach of the dreadful famines which used in past years from time to time to desolate the plains of France. Parmentier occupied himself a good deal from 1783 to 1791 in composing and publishing several most useful works upon domestic economy and agriculture. But soon the storms of the French revolution put an end to all calm meditation and enjoyment. He was too wise, and far too well occupied to take any active part in the

political discussions that raged around him, and his silence was considered as a disavowal of the principles which were then triumphant. Those who arrogated to themselves the title of "Friends of the People" began to persecute the man who had shown his friendship by his deeds. "Speak no more of Parmentier!" exclaimed an orator of the Jacobin Club, "he would feed us only on potatoes. It was he who invented them." His name was placed on the list of the suspected, and he was deprived of the small pension given to him by Louis XVI. and of his apartments at the *Hôtel des Invalides*. But he had scarcely been reduced to poverty before the absolute need of his services was again felt. The coalition of all the European powers against France forced her to neglect no means that might contribute to her security, and amongst these it was deemed advisable to reorganize the pharmaceutical department of the military hospitals, and to make the soldiers' bread better. This difficult task was offered to Parmentier, who accepted it with enthusiasm, and acquitted himself of it with zeal which was above all praise. To this day his name is gratefully remembered in the French army. He was now appreciated according to his deserts, and was called to one honourable employment after another in the service of humanity. All the learned societies sent him diplomas, and he was received as a member of the National Institute. During the time that Napoleon's empire lasted, Parmentier's life flowed on in uninterrupted prosperity and honour: but in 1813 his health was considerably injured by his grief on the death of a beloved sister, joined to his distress at the reverses sustained by the French armies. At the approach of the allied sovereigns he fell dangerously ill, and died on the 17th of December, three days after they had entered France. A distinguished French *avant*, Cadet de Gassicourt, delivered a funeral oration in honour of Parmentier before the Pharmaceutical Society; and in describing the life of this simple-minded and benevolent man, he dwelt on the two acts by which it was especially marked, and which contained, as it were, an epitome of it all,—the introduction of the potato and the syrup of the grape, which, in his own charitable intentions, were to become the bread and the sugar of the poor. François de Neufchâtel had already proposed giving his name to the potato, and calling it "*La Parmentière*," but his suggestion was not adopted, and few perhaps now in France remember to whom they are indebted for one of the most necessary luxuries they possess amongst the fruits of the earth.

EXTRACTS FROM NEW WORKS.

THE COTTAGE OF AN ALBANIAN SHEPHERD.

"Soon the barking of shepherd-dogs announced that our approach was heard; and, to our infinite joy, we found ourselves in a few minutes in a wild little Albanian hamlet, with the whole of its very unsophisticated inhabitants crowding round us. Instantly, when they found how wearied and exhausted we were, there was a great dispute as to who was to have the honour of offering us hospitality. Finally, the right to do so was claimed by the fortunate possessor of the best house in this village of shepherds. He triumphantly led the way to the dwelling, which we were told was so greatly superior to all the others. It was a small building, composed entirely of wood, and consisting of one single apartment. A large fire blazed merrily on a square stone near the top of the room, and the furniture consisted of various sheepskins, spread out on the clay floor as seats. We were invited to take our places on the ground, on one side of the fire, into which a handful of pine cones having been flung, it shot up into bright flames, which cast a strong glare on the strange scene around us. Opposite to us sat our

host and his wife, their daughter, a little girl of some fourteen, and her husband, a fine-looking youth of twenty. Beyond them were our servants, occupied in preparing our supper, and in rubbing down the horses, who had entered by the same door as ourselves, and were to share the same apartment; next to them were an ass and a pig, who were loud in their remonstrances at being thrust so far from the fire to make way for the new comers, not to speak of the innumerable cocks and hens who perched in the rafters, and flew about amongst us. I really believe we should have slept soundly in spite of all, but for the restlessness of the pig, who was a decided somnambulist, and the braying of the ass in his dreams—a sound which all must be aware is far from melodious under any circumstances; but those who have never had an opportunity of hearing it in a bedroom can have no idea how overpowering it then appears. The night was short, and we started again at three o'clock on our return home; but it was one never to be forgotten.—*Wayfaring Sketches among the Greeks and Turks, by a Seven Years' Resident in Greece.*

NIGHT SCENE BETWEEN DECKS ON A GERMAN
EMIGRANT SHIP.

"A hollow sea was running, and the waves thundered with heavy blows against the sides of the ship, which quivered to her heart at every stroke. Yet the gale had not blown long enough to raise the waves much; and heeling over to the wind—the position in which a vessel is both safer and has less violent motion than when it blows directly astern and the lofty mast sways from side to side—the good ship shot rapidly through the dark water, dashing the foam from her bows, while most of the passengers quietly and without alarm fell to sleep. . . . A wild confused cry, a thumping and washing of heavy bodies, an almost stupefying, piercing pain in the head, waked him [Werner]. Alarmed and surprised, he opened his eyes; and although everything around was hidden in pitchy darkness, he instantly perceived that the ship must have changed her tack, and was in consequence lying over on the other side, on which his berth was—for his head was thrown downwards, while his feet were pointed almost perpendicularly upwards. He changed his position in all haste. The frightful din between decks, however, went on; and creeping out of his berth, he became at once aware of the alarming condition in which he and the rest of his fellow-passengers were at the moment. . . . The luggage had been lashed to the stanchions, as usual in passenger ships, and in such a way, too, that most of the lids and covers might be opened to give the owners access to their stores of food and clothing;—but one of the peasants, not at once comprehending the reasonable purpose of keeping the baggage fast, and the risk which might attend the neglect of this precaution, had, in spite of the dissuasions of the others, loosened one of the ropes, in order to get more easily at something in his chest. The little tailor, who lay in the berth above him, may very likely have had a prophetic fear of the trunks and cases dancing about in disorder: for he had attempted to fasten them as before—but, being ignorant of the mystery of knotting ropes, had done it but poorly. So that when the ship began to plunge—when the whole weight of the baggage was awayed over, now on this side, now on that—the fastening gave way, and down came clattering first the little boxes and cases from the top of the pile, followed, at last, by the heavy ordnance, the immense chests of the emigrants. Many of them, indeed, with laudable zeal, instantly leaped out of their cribs when they perceived the danger: but from the frantic motions of the ship, they could hardly keep themselves on their legs, how much less master these heavy weights—and were fain, as a sudden shift of the

vessel threw the whole mass against them, to regain in all haste their berths, which were protected by stout planks, in order to save themselves from being lamed or crushed to death by the luggage which came falling upon them. Their condition now was terrible, and was made sadder by the moans of one of the young fellows who, in attempting to reach the hatchway and get on deck, had been badly wounded by some of the chests falling upon him:—while from all the berths the noise was increased by the wailing of the women, the screams of children, and the groans and sobs of the sick. It was a frightful confusion; and in vain did they all rage and cry for help from the sailors. In the darkness they could have done nothing, had they even had leisure then to attend to the unfortunate passengers. Then, when all might suppose the alarm had reached a height that could not be increased, there poured through all the din and uproar, through all the groaning and complaining, a cry of agony and unspeakable horror so wild, that even the sick and the children hearkened to the sound, and for the moment an absolute hush followed the dismal tumult. It was but for a moment: and the fearful exclamation—'A corpse! a corpse!' sounded from berth to berth, from lip to lip!—*The German Emigrant's Journeyings and Adventures.*

A NIGHT ON THE SHORES OF HINDUSTAN.

"We came to anchor, on the third morning after quitting Kedgee, under the walls of Fort William, and found H.M.'s 3d Dragoons encamped on the ghats. About four in the afternoon, the heat having considerably abated, we disembarked, and marched into the Fort, where quarters had been provided for our men, though none for the officers, as the brigade-major informed us, at the same time stating, that as a difference of opinion existed on that subject between himself and the fort-major, we must wait until he (of the Queen's) had craftily overcome him (of the Company's), and induced the latter individual to house us. There is an old proverb about a man between two stools being likely to come to the ground, which was fully illustrated in our case, for, both of our supports for a night's rest in Fort William having given way, we came to the earth, though fortunately in the tents of the 3d Dragoons, immediately under the walls of the fort, where our fall was kindly broken by cloaks spread on the ground to receive us. I was composing myself to sleep as comfortably as circumstances would permit, when suddenly a volley of screams, as though proceeding from the lungs of ten thousand demons, caused me to start on my feet, supposing the camp to have been invaded by the infernal regions. My host, lying in the opposite recess of the tent, being a man of some days' experience, begged me not to disturb myself, as it was only the jackals. 'Only the jackals!' but they are pretty nearly enough to murder sleep, I thought, as I laid down to await the cessation of their intolerable howls. Silence at length ensued, and I was just falling asleep, when a low gurgling noise arose close to my ears, and continued with the most monotonous regularity: 'Good heaven!' I cried, after listening intently for a few minutes, 'that must come from the diabolical bandicoots, of which I have often heard from old Indians.' I drew my sword, and awaited their advance in a violent perspiration, for I have an insuperable abhorrence to the whole rat tribe; but they had no intention of coming to close quarters. No, their cursed pipes sounded the advance, unheeded by the main body. My enemies, nevertheless, seemed to be mustering; for the gurgles were taken up by a reinforcement from the opposite side of the tent, interrupted occasionally by a low, muttering sound:

Jamjam efficaai do manus scientie.

'I submit; it is impossible to sleep through this interminable persecution, and a man's days in this climate

must be necessarily short without rest!' Thus I exclaimed, as jumping up, I threw my cloak aside, and paced the tent in a fever, saluted incessantly by the unearthly gurgle. My friend lay on the opposite side; sleeping as calmly as if there were no such things in the world to torture us as jackals or bandicoots. The morning was just breaking, and I stepped out of the tent, in hope of being taken for a ghost by the jackals, and thus retaliating by fright on a portion of my enemies—when, lo! the veil of mystery was withdrawn, and there sat two Hindoos smoking the pipe of the country, commonly known by the name of bubble-bubble, which noisy instruments I had mistaken all night for the bandicoots. This was too absurd. I burst into a fit of laughter, which awakened my friend, who hastily joined me, when I related my grievance. Having silenced the smokers, I soon enjoyed the rest I had almost despaired of attaining."—*Military Sketches by a Cavalry Officer.*

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE BROTHERS' ADVENTURE.

BY ROBERT SNOW, ESQ.

"Twas in a tropic ocean-bay
Two English boys went forth to swim;
Brothers they were; trained with the sea
To gambol; lithe of limb
And dauntless; now they float as still
As sea-birds; now with long-breathed skill
Headlong they dive below, and rise
With pied shells in their grasp, and many an oozy prize.
But I must not fail to tell
How a fairy islet lay
About three cables' length from shore,
The jewel of the bay.
And thither with swift strokes they race,
Holding pleasure still in chase,
Through cleft waves that, as on they dash,
Close round their shoulders with a rainbow flash.
And landing in a tiny cove,
They rove the islet o'er and o'er,
Naked, in boyish liberty;
And high and low explore
Its rocks, and inmost coral caves,
Whose bases mighty ocean lavas,
Dashing to their vaulted height
Gleams of mystic azure light.
And now 'tis time to think of home;
'Tis time again to take the flood;—
But oh, what spectacle of fear
Congeals their youthful blood!
Blade-like, peaked, black, and thin,
Above the water peers the fin
Of a hungry, roaming shark,
That seems the brothers for his prey to mark;
Nor is there within hail one friendly bark.
Ah, well may they grow pale with dread!
The younger clings about his brother,
And cries—"We never shall return—
My mother, O my mother!"
The elder boy, with desperate cheer,
Makes faltering answer—"Do not fear"—
Vain words; for see! the monster rears
His jaws in sight, then dips, then slowly reappears.
A deadly film comes o'er their eyes;
They have neither pulse nor breath:
But there to stand is to endure
Companionship with death.
Half conscious what they do, they creep
Into a cave that faces not the deep:
And, sooth, 'tis better patiently
Unseeing and unseen to lie,
Than daily with their watchful enemy.

And they look forth from hour to hour;
But still the shark is prowling near;
And they are cold; and sunset comes
With sundry kinds of fear.
And now the tide is flowing fast
Into their cave; all hope is past,
If they by swimming cannot reach
The footing of the friendly beach.
And still they shudder, crouch, and cower;
Oh, how unlike their former glee!
As from a strange and gory grave,
They shrink from the bright sea.
Heavy is their choice of woe;
For they must drown, or brave the cruel foe:
Once more they look;—hope beams! far off, or near,
They see him not—"Heaven send our way be clear—
Now is the time; we will not perish here!"
For the dear life to shore they strain,
Convulsed, worse than in fever dreams;
The sky seems blood, the waters blood;
And once the younger screams
Aloud for help!—yet both come safe to land;
But in a swoon he spent upon the sand,
Till a warm glance recalls them, and they hear
Wild words of love, breaking the trance of fear;
For she hangs o'er her boys—their mother dear.

THE DUMB GIRL.

ANNE A. PRFMONT.

On! for the harshest sound
To break this weary silence, and to be
Like the glad ones around,
So prodigal of speech, and full of glee—
I am too sad my hair with flowers to dress,
Nor can the mute one sing of happiness.
And when some childish grief
Cometh to cloud their brow, or wet their cheek,
Ah me! its stay how brief,
For they in list'ning ears the cause can speak;
Each word is breathed more touching than the last,
And when the tale is done, the woe is past.
But must I hide mine deep
In the recesses of my own sad heart,
For I can only weep,
And when they ask what I can ne'er impart,
How weak, how impotent, seems look or sign!
Ah! even words were vain for grief like mine.
But there is one, the best,
The sweetest, gentlest, most beloved of all;
For me she'll leave the rest,
And oh! how gladly seem her words to fall,
Though all unanswer'd by the silent lute,
Whose chords are broken, and the sweet voice mute:
And with a skill, love-taught,
Will read my feelings on my varying cheek,
Unlock each sealed thought
And give it utterance: if these lips could speak,
Oh, my sweet sister! every word should be
A heartfelt blessing, and breathed forth for thee!

THE ACTION OF WATER.

We have spoken of the agency of ice streams in changing the features of our globe, we will now mention the action of water in producing the like effect. We have here no theory to propound, no hidden causes to investigate; we have but to consult the records of early and late times, in order to see the truth of the adage, "continual dropping will wear away the stone," exemplified among the grand scenes of nature as well as in our experience of every-day life. But, first, let us trace the agency of water as a forming, not a destroying power.

At the mouths of all great rivers, *deltas*, or tracts of swampy land, are formed by the following process. The materials washed from the banks by the ceaseless flow of the current are held in suspension and carried along while the water is in rapid motion, till meeting the waves of the sea at its embouchure, the force of the river is checked, and the materials are deposited at the bottom, at a greater or less distance from the shore, according to the resistance which the river opposes to the sea, and also somewhat dependent upon other circumstances in the character of the stream. For a river greatly increased by the melting of the snows of a mountainous country, and rushing periodically in a large volume to the ocean, will, when thus swollen, not only carry the debris which it then bears farther out from the shore, but will act in the same manner, though in a smaller degree, upon the accumulations deposited at less turbulent periods. A stream, therefore, which flows through a tolerably flat country, and which is equable in its quantity and force at all seasons of the year, deposits its mud and sand in a more circumscribed space than that which has its source in a mountain chain. Thus are rich alluvial tracts formed, which constantly, but not visibly increasing, gain from the ocean what the wear and tear of its waves in other spots washes away.

The vast amount of mud and sand thus conveyed by running water may be imagined from an experiment which was made some years ago on the water of the Rhine, by Mr. L. Horner. This gentleman found that the average of solid matter brought down by the Rhine amounted to 400 tons per hour; and he thus calculated that in the course of one year upwards of 7,000,000,000 tons of debris would be carried along, the greater part of which must be deposited in Holland before reaching the sea, in consequence of the slow and meandering course of the river through that flat alluvial country. In the course of two thousand years the Rhine may thus have brought down enough material to form a stratum one yard thick, extending over an area more than thirty-six miles square. The "wandering Po" likewise brings down large quantities of debris; it receives in its course many mountain streams, each laden with characteristic matter, which in the descent of the Po to the plains about Ferrara impedes its current, and causes it to form numerous sluggish streams, powerless to bear away the soil with which they are impregnated. Hence a kind of promontory has been formed at the mouth of the river, which, throwing back the sea with double force upon Venice, has caused it to gain upon that city, as is proved by two pavements having been found lying beneath the present one in the place of St. Mark, and below the present level of the Adriatic. Ferber also quotes Italian naturalists as to the presumed fact of the rise of the sea. To the south of the Po stands Ravenna, once the capital of the Western empire, the link between Rome and Constantinople, the residence of the Gothic kings and of the Byzantine exarchs. It contains the mausoleum of Theodoric and the burial-place of Dante. Augustus formed a harbour at Ravenna,

but it is now filled up, and the town stands two leagues from the sea. The little town of Classe, which is situated in an adjoining marsh, was destroyed by the Lombards under Liutprand, A.D. 728; it was then a seaport, it is now situated four miles from the shore. If the Adriatic be indeed rising, or the bordering land be sinking, the quantity of soil brought down by the rivers must be very great to counteract this.

The delta of the Ganges is the most extensive and remarkable of those of which we have to speak. It commences at a distance of 220 miles direct from the sea, and has a base 200 miles in length, besides which enormous deposit, the quantity of mud and sand carried out into the bay of Bengal is so great that during the rainy season, when the stream is turbid, the sea does not recover its transparency even at a distance of sixty miles from the coast, and a glass of water from the river is said to yield one part in four of mud. Hindostan was probably once an island, by the union of the Jumna and the Sutlej, the bed of the Ganges being then an arm of the sea. The Hindoos assert that in the time of Bhagiratha, A.C. 2000, the Gangetic provinces were uninhabitable, except in the upper parts of the country where Satyvrata, or Noah, is said generally to have resided. Bhagiratha went to Hurdwar, and obtaining Gange, led her to the ocean, tracing with the wheels of his chariot two furrows as limits to her encroachments. This probably alludes to some wise legislator, who took means to reclaim the lands rendered useless by the overflowing of the Ganges; perhaps the whole country was a swamp without any distinct water-courses. The soil in the Gangetic provinces consists of different sorts of earth in great confusion, the lightest often lying below the heaviest. At an excavation near Benares, some years since, after piercing through several beds of clay, mould, and sand, the workmen came to an old bed of the Ganges thirty feet below the present one. In a deep stratum of river sand were mixed the bones of men and quadrupeds. Under this was clay and earth, and at the depth of 105 feet was fine white sand like that on the sea-shore. Besides this evidence of a former sea covering the plains of Hindostan, there are found in the valleys of the Sewalik mountains beautiful pebbles, agates, and fragments of marble, all rounded by the action of the waves. The Ganges has been known to rise in one night in a column of thirty feet perpendicular, and to carry destruction before it; thus the ancient city of Hastinapura was destroyed.

The delta of the Nile is well known, but it has been disputed whether this be wholly an accumulation formed by the river. Tunis is supposed to be the ancient city of Zoan; prostrate columns and other remains have been found there, leading to this opinion; if it be so, the delta has not increased in proportion to the rise of the land along the banks of the river, caused by the clouds of sand which are arrested by the mountains, and which fall upon the valley of the Nile.

Another instance of solid matter conveyed by a river, and forming land, is at the mouth of the Amazon. This river meets the current which crosses the Atlantic from the coast of Africa to that of South America, and the mud which is brought down is deposited along the coast of Guiana, where the sea is shallow; thus the land there is rapidly increasing. The waters of the Amazon are not wholly mingled with those of the ocean at a distance of 800 miles from its mouth, and may be recognised by their muddy colour. Thus, also, the red earth brought down from the hills of Lebanon by the river Adonis gave rise to the ancient fable of the annual bleeding of the wound which had caused the death of the favourite of Venus. The festival of Adonis was celebrated soon after the autumnal equinox, when the sun gradually withdraws his beams from the northern hemisphere, and the storms of winter begin to despoil the gardens. Then the imaginative heathens mourned the supposed death of the sun in the not less fictitious death of Adonis.

"Whose annual wound in Lebanon allured
The Syrian damsels to lament his fate
In amorous ditties all a summer's day;
While smooth Adonis from his native rock
Ran purple to the sea."

The power of water, when in rapid motion, of transporting not only mud, but heavy and large bodies, also requires illustration. We have seen that the theory of glacier action is a recent explanation of effects hitherto attributed to water; the distinction between the two agents appears to us to lie in the form of the transported blocks; and they may have acted consecutively; as a sudden subsidence of a glacier mountain might well cause the substitution of a torrent of water for a calm glacier. Hence the boulders lying upon the crests and sides of boundary hills would retain their angularity, while the smaller masses of detritus left in the valley would show the action of the torrent in their rounded forms. Icebergs may thus have been carried down to the sea, though we cannot consent to attribute to them the scratches noticed on the boundary mountains. The power of water as an agent of transportation can scarcely be limited. As weight is a relative term, and refers to the element or medium in which a substance is immersed, a stream laden with mud or sand would bear along with it substances which would be immediately stranded by a pure and limpid river, be its velocity what it may. Thus we read of the irruption of Solway Moss, which carried with it immense and ponderous masses; and as a comparatively insignificant case we may mention our own experience respecting the tremendous hail-storm which desolated so many parts of the eastern counties, August 12, 1843. On that awful night, a large dyer's copper which had been left in the street near a blacksmith's shop, was floated by the torrent of mixed hail and rain, a distance of between sixty and seventy yards down a very slight slope in the roughly paved street. The weight of this copper may be imagined from the fact that the aid of ten men was required to move it in the ordinary manner.

The most interesting description of the ravages committed by mountain-torrents in our own kingdom, of late years, is contained in Sir T. D. Lauder's "Account of the Moray Floods," which occurred August 1829. It is impossible to enumerate all the striking incidents described by this intelligent observer, but we may notice a few of them.

The river Nethey flows into the Spey on its right bank, nearly opposite to Tullochgorum. Previous to the flood it had a meandering course down from the Cairngorum mountains to the bridge which bears its name; but on the 4th August it cut a new straight bed for itself, destroying the haughs on both sides. Terror spread among the inhabitants at Bridge of Nethey; some were stupified; others, more collected, removed their effects. The river filled the smithy, and extinguished the smith's fire; then attacked the neat cottage, surrounded by its luxuriant garden, of an industrious tailor, which stood immediately facing the approach to the west end of the bridge. About six in the morning, the river began its work of destruction, and soon swept away garden, cottage, and road, scooping the ground out to a great depth, and cutting off all communication with that end of the bridge. "About eight o'clock, a number of people were standing on the middle of it, wondering at the immensity and the roaring of the river that was carrying down large trees, and tossing them up perpendicularly, when all at once the enormous mass of timber building composing the saw-mill of Stranbeg, about five hundred yards above, moved bodily off, steadily and magnificently, like some three-decker leaving dock. On it came grandly, without a plank being dislodged. It was tremendous—it was awful to see it advancing on the bridge. The people shuddered. Some moved quickly away; and others, spell-bound, instinctively grasped the parapet to prepare for the shock: its speed was accelerated; it

was already within one hundred yards, and the increased velocity of the current must bring it instantaneously upon them; destruction seemed inevitable, when all at once it struck upon a bulwark, went to pieces with a fearful crash, and spreading itself abroad all over the surface of the waters, it rushed down to the Spey in one sea of wreck. The bridge was of grey granite, its central arch thirty-six feet, and its two side arches twenty-four feet span, and of a solidity that promised endurance for ages. But the river having once breached through beyond its western land-breast, undermined it on the flank, swept away the western arch, and gravelled the others up eighteen inches above the spring. The height of the flood above ordinary level, at the bridge, was fifteen feet, and it was two hundred feet wide. Of four saw-mills, three were entirely ruined; and the works formed along the river for floating the timber completely disappeared; the channel itself being encumbered with large stones which the work of years only could remove. The cottages on the right bank were considered safe; but a clump of alders threw a strong current against them, and three were speedily carried away, with their furniture and gardens. A curious relic was discovered by the flood having swept away about twenty yards of a green bank this was a square stone building, about six feet wide and five feet high, having nine feet of bank over it. It was, probably, a place of concealment in former times, when the spot was covered with timber."

An extraordinary circumstance took place in Loch-namhoo, a small lake, ninety yards long, and fifty yards across, lying in a hollow; the centre of it being filled with a swampy island. "During the flood, one of the cross drains of the road sent a stream directly down a hollow, and rushed into the loch with so great force that it undermined and tore up the island; and the surface of the water being thus raised fifteen or twenty feet, and the wind blowing furiously from the north-east, the huge mass was floated and drifted to the southern shore, and stranded on the steep bank, where it now lies like a great carpet, the upper half of it reclining on the slope of the bank, and the lower half resting on the more level ground close to the water's edge. The island is composed chiefly of cotton-grass, rushes, and other aquatic plants, with strongly matted roots, to a depth of about eighteen inches, and having eighteen inches of soil attached to them, making the whole thickness of the solid part of it about three feet. In form it approaches the circular, and is about thirty yards in diameter. One of the most curious facts regarding this strange phenomenon is, that it is perforated by one large hole, five or six yards square, and two of a smaller size, which exactly correspond in magnitude, form, and position, to three hillocks of earth adhering to the bottom of the loch, and appearing above water, which are, in reality, nothing more than three of the roots of the wrecked island."

On the river Nairn, a fragment of sandstone rock, fourteen feet long, three feet wide, and one foot thick, and which could not have weighed less than three tons, was carried down the river a distance of two hundred yards. A bridge over the Dee, having five arches, and a waterway of two hundred and sixty feet, which was built of granite, and had stood uninjured for twenty years, was carried away by the flood, and the whole mass disappeared from the bed of the river.

Such is the formidable power of water by sudden irruption; the gradual wearing away of solid rocks by its agency is no less striking. In an eruption of Mount Etna, supposed to have been in 1603, a torrent of hard blue lava was ejected from one of the craters near the summit; it crossed the channel of the Simeto, the largest of the Sicilian rivers, and not only occupied the channel, but crossing to the opposite side of the valley, accumulated there in a rocky mass. Now, after the lapse of little more than two centuries, the river has cut a passage for itself through the lava, from fifty to

one hundred feet wide, and in some parts from forty to fifty feet deep.

After the disastrous floods in Scotland, of which we have spoken, it was deemed advisable to cut through the neck of a peninsula round which the Dorback wound, but which had been much injured by the flood; and this spot having in early times been the scene of a legendary occurrence, the laird was anxious to save it from total destruction. The level of the stream, on the south side of the neck of the peninsula, was about twenty-two feet above that of the stream on the north side; and the bank between rose only about six feet higher than the upper stream; through this neck the cut was to be made.

"Accordingly, on the 2d of November, six men went to work at eight o'clock in the morning, and by two o'clock in the afternoon they had effected a cut ten yards long, three and a half feet wide, from six to eight feet deep, and with a fall of about four feet from one to the other. The river was at its average size at the time, and a dam of a foot thick, and just of sufficient height to retain the water, was left, like the last pin that supports a vessel about to be launched. A little after four o'clock our party reached the spot. The order was given. A man sprang into the trench, and, with one blow of a pick-axe, the frail barrier yielded to the pressure above, burst at once, and the exulting river would have swept the man before it, had he not escaped with wonderful agility down the trench, with the water at his heels. Nothing could be more interesting or striking than this event, where the effect of a single blow was, in one moment, to produce so great a change in nature's works—a change which, though wrought by a single hand, was in itself, and in its consequences, so vast and so uncontrollable, that, if thousands of men had been on the spot, they could not have turned that river back again. On swept its devouring column, with the low hissing sound of a serpent, but with the force and swiftness of the eagle sweeping to its prey. To resist shouting was impossible. We joined in one hearty hurrah! And when our voices sank, we heard the deadened roar of the river as it poured over the clayey bank, in a fall of fifteen feet, carrying every thing before it, and damming back its own astonished waters, which it met and caught, after their long circuit round the Rhymer's Hill, filling them with the liquid yellow mud into which it was almost entirely converted by the havoc it was committing in its descent. Huge stones were continually rolling down, and some that we pushed in from the side disappeared along the cut with a rapidity which no eye could follow. It was really strange to see the water that came round the Rhymer's Hill gradually ebbing away as the new cut enlarged, until, in half an hour, it was nowhere ankle-deep, except in a few pools, whither the startled trouts were struggling to save themselves. The banks of the cut being undermined, rapidly gave way, falling in large masses at a time; so that when we left the spot, as it grew dark, not quite an hour from the time it was opened, it had already produced an amazing change in its appearance. By eleven o'clock the bottom of the cut was reduced to an inclined plane, and next morning, about fifteen or sixteen hours after the opening was made, it was converted into a wide and complete river-course; and when I saw it at four o'clock in the afternoon, exactly twenty-four hours after the water was let through, it had worked its way back, quite up and across the old course, to the depth of eight feet below the level of its old, and now dry channel."

But marine currents are much more striking in their effects than those of a river. In what is called the Grind of the Navir, in the Shetland Isles, the sea is constantly widening a passage between the hard rocks; and at the Faro of Messina the current acts so strongly and quickly upon the granite rocks of the strait, that the fort occupied by the British has been obliged to be removed farther inland. There we find evidences of the

land having formerly been raised; a platform of rock projects into the sea, and the cliff forms a semicircle above it, having at the base a small lake, which is connected with the ocean by a canal, which was cut by the English during their occupation of the fort. The alteration in the width of the channel was noticed to a friend of ours by the pilot, who had guided Lord Nelson through it. Great difficulty was experienced in forming the canal above mentioned, on account of the hard nature of the rock; it was accomplished by blasting with pipes. There are marks of glacier action in the granitic boulders which strew the shore.

On the eastern coast of England, in Norfolk and Suffolk, a double action appears to be going on. At Sherringham, the sea has encroached so much upon the land, that twenty feet depth of water now flows where within memory was dry land; and at Cromer, the advance of the ocean is a continual subject of anxiety and expense. We remember within forty years the loss of a village of perhaps twenty houses, by the falling of the cliff; and we have watched from year to year the disappearance of the fields through which the pathway passed which led to the cottages formerly standing upon the edge of the cliff. At Trimmingham, a few miles distant, there are beds of marine shells, and other fossil remains which show the elevation of the land. Again, at Gorleston pier, where the Yare joins the sea, there has occurred a loss of whole fields by the encroachments of the ocean, which flows up to the base of the cliff. We may truly say that for twenty-eight years that we have visited this place, the path to what is called "the common," has been carried farther inland every summer; the common itself is disappearing, bit by bit; and in a few years we shall have lost the only spot in the neighbourhood where the bee-orchis is to be found, and the richest botanical ground (for its size) with which we are acquainted. While this sad work of devastation is proceeding to the south of the mouth of the river, Yarmouth is gradually losing its great attraction, the sea. During a few years, we have noticed the accumulation of flat, fine sands, opposite to the town, with shallow runs of sea water at low tide, making a firm and agreeable promenade. The sea has retired so much, that some steps which twenty years since could not be ascended at high water, are now at a great distance from the sea, and the jetty is becoming useless as a place of landing, except at high tide. On the 25th of May, this year, the sea at low water retired forty feet beyond the end of the jetty, an event which was never known to take place before. Thus it would seem as if the coast of Norfolk between Cromer and Gorleston were rising, while at those two points it appears to be sinking. Something may be allowed for the deposition of sand at a point or promontory; as at Lowestoft the land is also gaining upon the sea.

Besides the action of fresh water at the mouths of rivers, traces of floods are to be met with all over the world; traces which we can scarcely refer to the great Noachic deluge, but which are probably to be accounted for by the sudden melting of mountain snows, or the continuance of heavy rains, as in Morayshire. Near the hamlet of Sobrão, in the neighbourhood of Oporto, Portugal, Mr. Kingston found that "on the hills in every direction were scattered immense rounded blocks of dark granite, like the petrified skulls of a race of giants, who might be supposed to have there fallen in some terrific combat."

We close our remarks with the Countess Hahn-Hahn's description of the "Rocks of Aderbach," whether they were brought into their present position by the agency of ice or of water, cannot now be decided.

"They are situated beyond the Silesian frontier, in Bohemia, eighteen miles from Saltzbrunn, and a wretched road leads thither. You advance in so narrow a labyrinth of paths and ravines, and the extraordinary formations approach so near to you, that rain or sunshine makes no difference. All these rocks, some of which

rise to the height of two hundred and fifty feet, stand upon their smallest base, some singly, some in groups, on a marshy meadow-ground, elevated above the surface by a caprice of nature, and rent from the body of the hill: for there are hills enough round about, but their blocks are piled upon one another. Here it appears as though mountain spirits had been attempting with rude hands to copy the forms and works of men; and, dissatisfied with their clumsy and colossal imitations, had flung them down by one another, and half-buried them in the swamp. So fantastic, and to a certain degree, so like are these forms, that you are disposed to believe the guide, when he points out to you, with the gravest look in the world, here the 'twins,' there the 'mummy,' there the 'veiled nuns,' there, St. John in the wilderness,—'That little man up yonder, between the stones,' he adds, for your better information. Upon the designations fortress, market-place, cathedral, &c., you hit of yourself; but with deep shame I confess, that it was impossible for me to recognise the 'Breslau wool fair.'

"The way through this world of rocks is sometimes extremely narrow, at others it expands into a wider space; in some places the sides are so close that you are obliged to squeeze and stoop to get along. Wooden steps facilitate climbing wherever it is necessary. The most striking point of the labyrinth is the grotto with the waterfall. The bright, cheerful, ever-moving stream suddenly tumbles all affrighted into the dark cellar-like grotto, and thence winds in a thousand tortuous meanders round the foot of the rocks into the open country. On the level plain, a few hundred paces from the entrance, at which the 'overturned sugarloaf' keeps guard, stands the public-house." F. C. B.

THE MAIDEN AUNT.—No. IV.¹

CHAP. III.

In the evening Edith joined Mrs. Dalton in a window, where, apart from the rest of the company, she seemed to enjoy a reverie. She did not speak, but pointed to the massy outline of a distant hill, behind which the moon was rising, huge, dim, and red; but, in proportion as she departed farther and farther from the earth, seeming to gain in purity what she lost in splendour. The mute symbolism of nature is indeed expressive. Two years ago Edith would have felt that shamed-facedness which is the mark of a keen and delicate enthusiasm in woman; she would have shunned to make the silence of her rapture a spectacle for a mixed and unsympathizing party of mere acquaintance. But she had now acquired a fearless freedom of action infinitely more comfortable to herself, and perhaps only to be regretted on account of the mixture of the motives which gave rise to it. She had become so accustomed to be admired for whatever she did, that she had nearly learned to think that every thing she did must be in itself admirable; not that this was the conscious and definite working of her mind, but rather that, being sure of obtaining approbation, she forgot to inquire whether she deserved it or not; she had got the current coin, and she cared not to test the purity of the metal. Yet the adulteration was very slight—quite imperceptible to herself—it was only, in the strictest sense of the word, a *beginning*. So is an acorn only a beginning, and a small one—but the end of that beginning is the mightiest of trees; and in every beginning the whole progress, development, and final consummation, are, as it were, folded up and contained, ready for gradual expansion. The thought is as full of comfort as of warning, though, alas! the warning is the more needful of the two.

"Some more, Amy," said Mr. Thornton's voice, behind the ladies, "you have indulged your meditations

long enough and must now think a little about the enjoyment of others."

Mrs. Dalton looked round with a smile, and immediately moved to the piano. She put her cousin back with one hand as he offered to escort her, whispering at the same moment, "No, no; I don't want you. I am going to exhibit, so you may talk at your leisure." She sat down, and, under cover of Schullhoff's *Galop di Brava*, which was presently electrifying the room, Mr. Thornton returned to the window and to Edith. He began with a platitude, such as even the most brilliant genius must occasionally utter if he be resolved to talk in season and out of season.

"So you prefer moonlight to conversation," said he.

"To some conversation," returned the lady, looking very intelligently at the scattered human beings who adorned the chairs, sofas, and ottomans around her.

"But not to *all*? I am afraid I can scarcely hope to be classed among the exceptions." This timid speech was accompanied by a very decided assumption of the vacant seat next Edith. She laughed slightly, as though she perceived that the words and the movement were a little inconsistent with each other, and answered frankly, "Why, I scarcely think I do prefer even such a scene as this to the conversation which we had with Mrs. Dalton before dinner. It was very interesting."

"Almost too interesting," replied he; "such moments unfit one for the trivialities of everyday life and commonplace people. Though all beauty is said to arise out of contrasts, yet there are some contrasts which at once and irremediably destroy beauty;—you would not mix moonlight and lamplight in a picture."

"Yet they are very beautiful in reality," said Edith, looking from the brilliant room to the still, silvered woods without.

"I suspect," said Mr. Thornton, "that, as in most things which we call beautiful, the charm lies rather in the mind of the interpreter than in the thing interpreted. Is that too philosophical for you?—I know you are a student of German."

"I delight in listening to what is beyond my comprehension," returned Edith. "Either the mystery pleases me, or else the feeling that I have the power to reach it if only I have time and help afforded me. No pray go on with your theory—you think that there is no such thing as Beauty, really, but that it all depends upon the mind of the person who is looking. I don't know how to express it; but you see what I mean."

"Yes," replied he, "what is noonday to you and me would be midnight to a blind man."

"But the sun is the same," retorted Edith.

"Not to you, if you are blind," he answered. "It is, to you, as if it did not exist. But these analogies are very deceptive; one can't carry them out. To illustrate what I mean by plain facts,—the pagoda which is beautiful to the Chinese would have been monstrous to the Greek; and again, the worshipper in Cologne Cathedral would find little to excite his devotion at Pæstum."

"And you believe in none of them?" cried Edith.

"Just the reverse," said Thornton, smiling; "I believe in them *all*. I believe that the elements of truth, goodness, and beauty, are everywhere for those who can see them—the whole, nowhere for any body. To disbelieve in their existence would be as absurd as to restrict them to any particular forms or systems. Some possess more, some less; the man who has emancipated himself from all has the best chance of collecting the fragments which all contain."

"I think I understand," said Edith; "I see how this leads naturally to universal toleration."

"True," he replied, "toleration—charity—love, becomes the law of life, and Christianity assumes her proper place, as the system containing the highest development of that law which has yet been granted to us. Viewed in this way, can any thing be more ludi-

crous than the conventional rules which would seek to conform all characters to the same model? Rather find out, in the countless variety of materials submitted to you, those with which your own inner voice accords, and associate yourself with them, if you would attain happiness. All the misery that we see around us seems to me a blunder, not a necessity."

"Nay," said Edith, half doubtfully, "but if we sin we must needs suffer, must we not? Is not that the real cause of misery?"

"Every fault," returned he, "brings an inevitable portion of suffering with it, which is the best safeguard against repetition of it. But repentance is in itself restoration; the idea of punishment, except in so far as it is needful to procure amendment,—the idea of *retribution* is absolutely preposterous. We are all imperfect and in a state of progress, and of that progress purification is a necessary part."

"Yes," said Edith, "because we have not merely to do what you said just now, to choose the outward circumstances which best suit us, but, as we cannot create circumstances, we have also, and more frequently, to adapt ourselves to them."

"Perfectly true," he rejoined. "This is the difficulty of life, and in this its pain consists to those who will persist in refusing to use it rightly. But out of the discord gradually arises a fuller and more glorious harmony."

"A glorious harmony! Yes, indeed," cried Mr. Delamaine. "You were speaking of Mrs. Dalton's playing. Did you observe how that discord was first prepared and then resolved?"

"Some people seem resolved to prepare nothing but discords," murmured Mr. Thornton, with a mixture of annoyance and amusement.

But at that moment Mrs. Dalton ceased the marvels with which she had been delighting or deafening her audience, and broke into music of a very different strain,—a low, quick accompaniment, like the rustle of abundant leaves, through which the notes of the melody stole like drops of water falling in twilight. You must watch heedfully if you would see each one glisten as it passes; the breathlessness with which you listened would have moved the repose so essential to musical beauty, but for the lulling stillness of the undersong. Mr. Thornton held up his hands as if imploring silence, and then putting them before his face, seemed to abandon himself to enjoyment. And he did really so abandon himself, that the only reminiscence of his conversation with Edith which flitted across his mind, might have been contained in the following words: "Strange, that I have been talking philosophy instead of sentiment! I don't believe she will touch me, after all!"

Edith's reflections were somewhat deeper. The refined epicureanism to which she had been listening had singular fascinations for her; and it was, moreover, so interwoven with truth that she could not separate the one from the other. Life was then no burden to be borne, no struggle to be encountered. Sorrows were anomalies and exceptions in this system, not chief and necessary parts of it; they were the results of imperfection, to be endured, and surmounted, and forgotten. Sins, if forsaken, were no subjects of grief; discipline was necessary as a means of happiness, not of holiness. Vaguely did these results of the principles presented to her pass before her mind,—so vaguely that they seemed not to testify to the falsehood of the principles which involved them. Would Edith have entertained these thoughts three years ago? Certainly not. Was she, then, a better logician at eighteen than at one-and-twenty? Scarcely,—her logic at either age did not exceed due feminine limits. But Edith had been living for amusement for three years; living, in fact, to speak plainly and shortly, to and for herself. Her conscience had learned to suggest her actions by the assurance that there was "no harm in them," not by the authoritative injunction, "Do this because it is right." The wo-

man who leads such a life as this must make up her mind to two dangers:—first, she is sure to encounter temptation; secondly, she is sure to be unprepared for it. The rule of quiet obedience, of childlike faith, of daily self-denial, excludes the evil simply by leaving no room for it. It keeps the heart as in the shadow of some cool and voiceful cloister, and has the twofold virtue, that it is at once a safeguard from temptation and a strengthener against it. But of such a rule Edith had known little at any time, though the kindly influences of her childhood and early youth had in some measure supplied its place; they were, however, rather a shield from the foe than an armour on the body—the shelter was withdrawn, and she was found weaponless. Yet who shall say that with her noble impulses, generous feelings, amiable temper, warm heart, and (to speak in popular phraseology) *innocent* life, she was not a favourable specimen of her class, sex, and age in this our Christian England? Who, to take lower ground, could expect her even to *fear* that she was gradually departing from such a standard as Philip Everard carried in his heart of hearts? But we will not anticipate.

Mrs. Dalton's fantasia, or whatever it is to be called, came to an end, and Mr. Delamaine was at her side in a moment, begging for a song. She smiled her most bewitching smile, but immediately played an air with variations. "Do you like that?" inquired she, as she concluded. "It is one of Thalberg's."

"Oh—ah—yes—indeed," was his reply, "I should have recognised it immediately. So orchestral—there is no mistaking his style."

Mrs. Dalton looked a little mischievous, and Lord Vaughan, as he read on the title-page of the music the name of Mendelssohn, smiled to her with the open and gleeful significance of one who is not often in the secret of a private morsel of satire, and who inwardly congratulates himself on understanding it.

"But," pursued Mr. Delamaine, "you used to sing 'Ah luce di quest'anima' used you not? You have not forgotten it?"

"Oh, no," answered she, graciously: "music that I have once learned keeps a most pertinacious hold on my memory."

"I am sure it is here; do let me find it for you," cried her persevering admirer, dropping suddenly down on his knees before the music-stand, thereby causing Lady Selcombe to start, and dislodging from her lap a perfect avalanche of coloured wools. Having duly apologized for and repaired his misdeed, he proceeded to institute a vigorous search for the song, during which Mrs. Dalton chatted about music with Lord Vaughan and Sir Mark Wyvil, and finally began to play Irish airs, with intense feeling and variety of expression. "Ah luce di quest'anima" was at length found, and placed before her; she acknowledged the service by another smile and a most grateful bow, but continued to play without heeding it for at least half an hour. Then, leaving her chair, she addressed a young lady who was seated near the piano, listening to her with a kind of sullen and reluctant admiration, "My dear Miss Mainwaring," said she, "Mr. Delamaine is longing to hear you sing this song. We all know it is one of your favourites. Now, pray oblige us—as for me, I am really quite tired." She retreated as she spoke, and spent the rest of the evening in walking on the terrace, whither she would not allow either Edith or Mr. Thornton to follow her. Miss Mainwaring, who was cultivated and commonplace, obliged the company with untiring assiduity, and Mr. Delamaine, though looking at first a little blank, was politely attentive and vivaciously critical. Ere they separated for the night, however, Mrs. Dalton approached one of the open windows, and leaning her arms upon the sill, warbled Mozart's pretty and familiar "Buona notte, buona notte, amato bene!" without accompaniment, with a richness and delicacy which astonished even those who were best acquainted with the wonderful beauty of her voice. The music was

appreciable by all, the silence was breathless, the applause unbounded; and when the fair songstress had glided up-stairs to her apartment, Mr. Delamaine observed, with much animation, "What a fascinating woman Mrs. Dalton is!" From this sentiment no one dissented, unless Sir Mark Wyvil's significant clearing of the throat might be so interpreted.

By the end of a fortnight Mr. Thornton had made considerable progress in his portrait of Edith, and had advanced yet farther in his intimacy with her. His cousin watched them with much interest, but could not satisfy her mind as to whether they were becoming really attached to each other or not. Mutual admiration was very evident; close attention on the gentleman's part, extreme graciousness on the lady's; but then Edith was gracious to all her admirers; indeed, a stern observer might not unjustifiably have pronounced that she coquetted with them. Lord Vaughan's devotion, though quiet and unobtrusive, was most profound. Mr. Delamaine's compliments were offered with a hardy and perpetual earnestness, which left no room to doubt their sincerity; yet both were encountered by her with just that mixture of piquancy and gentleness which was sufficient to keep hope alive, though it could scarcely be called encouragement. Total indifference or complete preoccupation might have blinded her to their real sentiments; but she appeared to like their attentions so well that these motives could scarcely be attributed to her; so the only conclusion left was, that if she were blind, it was partly for the very sufficient reason that she would not see.

"It is to-morrow that Captain Kinnaird comes, is it not?" said Mr. Thornton, as he uncovered his canvass, and prepared for the morning's labour. "You must give me a long sitting—I am quite anxious about his opinion."

"Oh! do not hope for Frank's approbation," returned Edith; "if you were to paint me with a palm-branch in my hand, and a glory round my head, he would still think you had not done me justice."

"The very circumstances under which it would be impossible to do you justice," cried the artist, laughing. "If you will allow me to say so, that is the only character under which I could not portray you to advantage."

"And what character is that, pray?" inquired Lord Vaughan, very quickly, and half affronted.

"That of a saint," replied Mr. Thornton. "Miss Kinnaird has not severity enough for an artist's ideal of a saint; and I am heartily glad of it, for if she had, I am sure I, for one, should be exceedingly afraid of her."

"So I should think," said Edith, a little more dryly than was her wont.

"Yes, indeed," exclaimed Lord Vaughan; "only just fancy a young English lady of the present day looking like a saint! Just imagine a saint in embroidered muslin, with all those frills and flounces, and hair which it must take at least an hour to plait and curl!"

Everybody joined his laugh at the juxtaposition of two ideas so glaringly incongruous, as those of a saint and a "young English lady of the present day."

"Where is Kinnaird now?" pursued he.

"He is staying with the Verners."

"Ah, poor Verner!" cried Mr. Thornton, "what a wreck he is! It is positively painful to me to sit in the room with that man. He used to be the most brilliant companion; he had more refinement than any man I ever met with. In that respect he was absolutely feminine; and then such inexhaustible spirits! he would keep you roaring with laughter a whole evening; and then, when you were lounging off to bed, perfectly worn out, and scarcely able to speak from sheer fatigue, there was he as fresh and as cool as if he were just going to breakfast!"

"And what has changed him?" asked Mrs. Dalton.

"Marriage," was the laconic reply.

His cousin fixed her deep reproachful eyes on him without speaking.

"Such a marriage!" reiterated Lord Selecote. "Yes, now that is a man whom one regrets to lose. Everybody liked Verner; with all his faults he was the most popular man of my acquaintance."

"What sort of woman can Mrs. Verner be," observed Edith, "to neutralize such an abundance of good qualities?"

"She is pretty, accomplished, tolerably amiable, and by no means stupid," said Mr. Thornton; "but—to sum it up in one tremendous word—she is vulgar."

"Yes, it was indeed a pity," chimed in Lady Selcombe; "she was low in family, and is decidedly underbred."

"Besides," said Mr. Thornton, "Verner never liked her,—how could he? They were so perfectly congenial. A woman who would talk of her carriage and four, and tell you the cost of her drawing-room furniture, at a dinner party! And he the most fastidious of men!"

"He never liked her!" repeated Edith, in a bewildered tone.

"She cannot conceive the possibility of a marriage without love," said Mrs. Dalton quickly, to her cousin. Then, turning to Edith, she added, with a mixture of sarcasm and sportiveness, "Did you never in all your life hear of such a thing as a *marriage de convenance*—as marrying for money, for station, for a home, or any other motive except the schoolgirl's ideal of 'love in a cottage'?" Oh, my dear Edith! if we could only stand in Madame de Genlis' Palace of Truth for five minutes!

Edith blushed painfully. Perhaps friendship is the most sensitive of all affections; the first doubt—the first neglect—the first seeking of another for that sympathy which we thought it our own special privilege to give—these are moments which burn their traces on the heart, and leave a scar which, though it may possess the dubious advantage of callousness to future impressions, inflicts agony ere it hardens. And to such wounds friendship is specially liable. Love confers an equality, whether real or imaginary; there is a balance of feeling; its very essence is reciprocation. But friendships are for the most part unequal, existing between persons whose characters are dissimilar, either fundamentally, or in the aspect which they present to each other. The keen tenderness, the watchful reverence, the fear, the passion, are not equally divided, and much must he suffer in whom they predominate; much must he forbear, long must he persevere, ere the bond of full and perfect confidence is finally established. But, if there be indeed that hidden basis of sympathy, without which no true friendship is conceivable, it is well worth the struggle; for the reward shall overpay the labour. Forbearance, trustfulness, hope—on these three pillars may the temple be reared—but if one of these fail, especially if the second fail, there will be nothing but a shapeless ruin!

"I don't think Miss Kinnaird need fear the Palace of Truth on this subject," said Sir Mark Wyvil, with a malicious emphasis on the name, and a glance at Mrs. Dalton.

"Nor Sir Mark Wyvil," retorted the lady instantly. "Both are equally transparent—but with a somewhat different effect."

Sir Mark was discomfited, and Mr. Thornton resumed the conversation, addressing Edith: "Oh, it was one of those sad cases in which a marriage without affection is almost compulsory. He ran through a fine income; he was not the sort of man who could ever have lived within his income even if he had been as rich as Hudson; and then he had to choose between selling a place which had belonged to the family ever since Queen Elizabeth's time and marrying Miss Jarvis—a pretty girl enough,—and devotedly attached to him."

"You must excuse me," said Edith; "but I think the lady is the more to be pitied of the two."

"Not she!" cried Lord Selcombe. "She is as happy as a queen, and has her own way in everything."

"That is just the happiness of a queen," replied Edith; but not of a woman."

"But she dotes on her husband," said Lord Selcombe. "And he—is indifferent to her!"

"It is better to worship than to be worshipped," said Mrs. Dalton in an undertone and with a half-sigh.

"Verner was a younger brother," said Lord Vaughan; "what became of the elder—of Montague Verner? I remember the rejoicings at his coming of age when I was a good little boy in petticoats."

"Oh," said Lady Selcombe, with a grave shake of the head, "he was always very eccentric! It was a great grief to his family. He took up some religious mania, and would not live on his property."

"Yes—a canting rascal," cried her lord;—"he nearly broke his mother's heart. Some fancy about its being church property,—the father was living then, you know, and he was a man who wouldn't stand any nonsense—so they quarrelled—and the young gentleman took his leave, went into orders, and was off to Van Dieman's Land, or some such place; and I've never heard anything about him since."

"A nice sort of religion," said Lord Vaughan, "which makes a man quarrel with his father!"

"Why," said Lady Selcombe, lowering her voice, "I have heard that there is insanity in the family; and, you know, that kind of religious enthusiasm, if it doesn't begin with insanity, generally ends with it. Very few minds are strong enough to hold their balance when those notions get hold of them."

The world's charity and the world's condemnation,—both appropriately exercised! Perhaps some such idea was present to Mrs. Dalton, for she had ceased to take any part in the conversation, and at the first pause she began to play. As usual, when she finished her performance, she was implored for a song; and as usual, when implored, she did not comply. She professed to be weary of watching the progress of the picture; engaged Lord Vaughan, who had still something of the schoolboy about him, in a private conspiracy against her cousin's brushes; made the room ring with her musical laugh when Mr. Thornton, having fallen into the trap, and finding himself about to paint Edith's forehead with Prussian blue, uttered an exclamation of disgust; and then darted off into the garden for a solitary ramble.

"She has the spirits of a child," said Mr. Thornton, a little impatiently.

"And how music excites her!" observed Lady Selcombe. "When she began to play she had a brilliant colour, and before the end of the piece she was as white as my pocket-handkerchief."

The rest of the morning was spent in discussing the details of a grand approaching piece of gaiety that was to take place under Lady Selcombe's auspices; namely, a bazaar for the benefit of an hospital in process of erection at ———, the town nearest to Selcombe Park. "The celebrated beauty, Miss Kinnaird," though not exactly advertised in the handbills, was reckoned upon as first among the attractions which were to gather the neighbours from far and near for charitable purposes. She was to preside at one of the stalls under the *chaperonage* of Mrs. Dalton; her costume was to be new for the occasion; and in his character of Artist, Mr. Thornton was allowed to arrange the distribution of colours. Lord Vaughan had asked and received permission to provide her with a bouquet; and Mr. Delamaine, who was never tormented by any importunate self-distrust, had constituted himself Critic-in-Chief, and soliloquised at great length over the bonnets and mantillas which Edith successively tried on, while she was listening for the more refined compliments of Mr. Thornton, receiving the silent homage of Lord Vaughan, or submitting to the good-humoured comments of her host and hostess. Edith's enjoyment of the admiration which she excited did not exceed the limits of what is popularly termed "harmless vanity;"

and harsh indeed would the censor have been deemed who should have passed sentence of condemnation upon her, for the manner in which she spent that bright autumn morning. Yet the particulars would have looked a little strange if they could have been faithfully noted down in her diary—especially if the varieties of *feeling* which beguiled the long hours of their tediousness could have been as accurately reported as the outward occupation.

"Edith, love, I vexed you to-day," said Mrs. Dalton, coming into her friend's room, as, weary with amusement, she was languidly brushing her hair ere she retired to rest.

Edith's quick change of colour showed that the allusion was understood, though with the sudden impulse which always prompts us to accuse our sensitiveness of absurdity, and to wish to hide it, she, almost involuntarily, disclaimed the imputation.

"No—don't deny it," pursued Amy, kissing her forehead, "you were vexed, and I am glad that you were, because it shows that you love me. But now promise me," she added with singular vivacity, "that you will never take to heart any hasty speech of mine; you may be sure that I shall never mean any unkindness by you; and I have an imperfect temper—that is to say, you don't know what may have happened or have been said to wound me and make me irritable. Even the closest friends know very, very little of each other, but that need not interfere with affection. Promise me, Edith!"

Most heartily did Edith return her embrace—most warmly did she give the required promise. The delicious feeling which she experienced at this first distinct avowal of friendship richly overpaid her for the pain which she had suffered. After a moment's pause, she replied—

"But I cannot bear the idea that friends know but little of each other, and I can never think it true. It seems to me that confidence is a necessary part of friendship."

"Yes," answered Mrs. Dalton, "but confidence is a word with a great many meanings; the highest of all is the confidence which gives full sympathy to the *feeling* without knowing, or wanting to know, its *cause*. However, I will confide to you," she continued in a lighter tone, "that I was annoyed this morning, because, as I myself never was in love in my life, your words sounded like a reproach to me. I see you are shocked at my confession; and now I want you to confide in me."

"Oh, don't ask me!" cried Edith, quickly, her face becoming crimson.

"Nay, 'tis no very searching question," replied Mrs. Dalton; "I only want to know what you think of my cousin Godfrey!"

"I like and admire him excessively," exclaimed Edith, with earnestness; "I think him a genius, not merely in art, but in conversation. How different it has been since he came here! Everything seems to have received a higher impulse—nothing is commonplace."

"Quite true," observed Amy; "and he has admitted you into some of the secrets of his mind, which are unsuspected by the world of mere acquaintance."

"Yes," said Edith, hesitatingly, "he talks very freely on all subjects of feeling. Sometimes he quite startles me; but it is very interesting."

"That is his particular charm," cried Mrs. Dalton; "he really lets you know what he is thinking and feeling; he never stops on the surface of anything—he goes into the depths at once."

"Yes," repeated Edith, "that is one way, you know; but sometimes one finds out that people are feeling very strongly, just by their *not* speaking on the subject."

"Did you ever know any one," pursued Mrs. Dalton, "who so transformed and raised the whole tone of conversation without pedantry or parade? It is so refreshing in the midst of the mediocrities of society."

"It is perfectly delightful," answered Edith; "that is

what I so especially admire in him. And how curious it is that there should be such different ways of doing the same thing!"

"One of his greatest merits in my eyes," continued Mrs. Dalton, "is in the quickness and refinement of his sympathies; I never can endure a man who laughs at a feeling."

"Oh! but dear Mrs. Dalton," exclaimed Edith, quickly, "that may come from such a different cause. A person may laugh sometimes only because he feels too deeply to like to show it. Sometimes, you know, a laugh is one's only escape from tears."

"That is not often the case," said Mrs. Dalton.

"No, not often, but sometimes," returned Edith; "I think it would be very hard and very unjust to decide that a man was cold-hearted even if he sneered and scoffed at subjects of feeling in company. It may come from some private cause—some early grief, which one knows nothing about, but which has changed the whole life; besides, there are other ways of raising the conversation, and impressing you with high notions of character, than those which are distinct and open. One never thinks so highly of a person as when one has found out his merits and his feelings in spite of himself, and, as it were, against his own will."

Mrs. Dalton suddenly lifted her lustrous eyes, and fixed them full upon the face of Edith, who, colouring and shrinking, stooped over the toilette table and began to busy herself in putting into their case the ornaments of which she had just divested herself. Suddenly her friend seized both her hands, and still inflicting on her that merciless gaze, exclaimed, "Edith, you said just now that there should be no reserves in friendship, tell me—were you ever in love?"

THE LAST YEARS OF THE LAST SAXON KING.

"A meagre man,
In humble garb, who rested with raised hands
On a long staff, bending his head."

It was many years after the direful battle of Hastings, that there landed from a ship at Dover a bare-footed and toil-worn pilgrim. His frame was tall, beyond the ordinary height of man, but it was much bowed with age or weakness, and he seemed to walk somewhat feebly, and to grasp his long pilgrim's staff as if in truth he relied on it for support. There was somewhat in the manner of this pilgrim which had excited much interest in his fellow-voyagers, and no slight degree of curiosity also, which, however, they had found themselves unable to gratify. His conduct was humble and unassuming in the extreme; and yet, withal, there was a certain dignity of bearing, which completely and effectually repelled the advances of the curious. He spoke little, and that in the most courteous wise, yet were his words select, his language choice, his tone, though subdued, dignified. Of his face no one had been able to obtain the most transient glimpse, so entirely was it shrouded from observation by his cowl, which he at all times kept watchfully and warily closed; and this circumstance was in itself fully sufficient to keep alive the curiosity of those, who then, as in this day, were more liberally disposed to pry into other people's affairs than to attend to their own. As the ship approached England, and the cliffs of Dover appeared in sight, the agitation of the pilgrim, who had oft expressed his longing to see the English soil, became perceptible to all around; he leaned over the vessel, he directed his gaze unbrokenly to the castle of Dover, now plainly perceptible; his hands were clasped, his frame shook with irrepressible emotion, and tears, of which, apparently, he took no heed, were seen by curious observers to fall on the sleeve of his gown.

By the time the vessel touched the strand he had succeeded in repressing his emotion, and had resumed

his usual calm and unperturbed demeanour, and it was with his accustomed subdued tone and manner that he received and joined in the congratulations of his fellow-travellers on the happy conclusion of their voyage. His uniform humility and gentleness had, however, much endeared him to some of his companions, and they were anxious to offer to the wanderer, and perhaps stranger, the hospitality of their own firesides. With much emotion of manner, but with unshaken firmness of purpose, he declined their proffers.

"At least," said a sturdy Saxon franklin, "tell us by what name to remember thee!"

"Remember me in your prayers as Christian the Hermit, and may the saints be gracious unto me as I do daily offer up my orisons for thee and thine."

So saying Christian grasped the hand of the worthy Saxon, and turned away.

The franklin felt a queer sensation in his throat and in his eyes, which he endeavoured to dispel by bestowing some hearty curses on the serf who was attending to his baggage. The remedy proved efficacious, and in a few minutes he turned to survey the scene around him. His eye glanced towards it carelessly enough, but was suddenly caught by the sight of a dark object on the opposite hill. Again he looked, and again. The figure continued to move on slowly, and with evident difficulty, up the toilsome ascent of the castle-hill.

"By the bones of my ancestors," exclaimed the Saxon, "it is the hermit! What seeks he in yon frowning pile?" continued he, with true Saxon feeling, as he glanced at the *then* Norman castle; "better for him had he sought an humble home at the hearth of an honest Saxon."

And, truly, so thought the hermit; but his thoughts had reference not to the present moment, as to whose comforts habit had rendered him perfectly indifferent, but to opinions and circumstances years ago passed away.

"And this," said Christian, as after a toilsome pilgrimage, during which he had often for very weakness and weariness sake stopped awhile to rest, and to wipe away the huge drops of sweat which gathered on his brow, and the heavy and blinding tears which over and anon bedewed his eye—"this is my land, my country, the seat of mine ancestors, my father's home, mine own inheritance! This," added he, shortly after, rising and stretching his arms around, as if his imagination enclosed the whole island in their embrace—"this is—this was—my country—my kingdom!"

"Great God!" continued he, after a pause, bending reverently, and raising his hands towards heaven,—
"great God, who hast created all things, before whom all nations are as a drop in the ocean, as the small dust of the balance—thou who bringest princes to nothing, and makest the judges of the earth as vanity—God, the everlasting, the Lord, the Creator of the ends of the earth—blessed be thy name for ever, who in the midst of judgment hast remembered mercy, even to such a worm as I am: Lord, what am I, that I should set myself up against thy will? Thy will be done, O Lord! Amen."

For a long time Christian continued prostrate in supplication and prayer; and his agitation, which had in truth been uncontrollable, gradually subsided. At length he arose, looked on the scene around him once and again, and prepared to descend the steep. Hastily had he gone a few paces, however, ere he returned, gazed around with inexpressible yearning and fondness, and once more seemed to give himself up to bitter and unnering remembrances, for again the tears dropt from beneath his cowl, and fell unheeded on his sleeve. But he roused himself, gave vent to a muttered ejaculation—"God be merciful to me a sinner!" and

(1) Earl Godwin was governor of Dover Castle, and had immense possessions in the neighbourhood.

hurried as swiftly down the cliff as his feeble limbs admitted, never once trusting himself to look behind the whole way. As the sun was setting on that evening, Christian might be seen wending his way towards Canterbury, with a composed gait and a placid countenance. * * * *

And now again—

"'Tis sunset—the chime of the even-song bell
Floateth silvery and soft over wood and dell,"

as the pilgrim is seen a few miles beyond Hastings, on a plain that was even then pretty generally known by the name of Battle. Often he starts, and stops, and looks wistfully around, as it would seem some remembered object caught his eye. But how great was his excitement, when turning a point which had obstructed the view, the magnificent abbey suddenly burst on his sight, and the solemn and musical summons to vesperservice, which was pealing from its towers, came in rich and full melody on his ears. An involuntary exclamation escaped him, and he stood for some time motionless with admiration and surprise.

It was a magnificent structure. The principal entrance was a noble erection in itself, forming a large square building, flanked at each corner with octagon towers. The whole pile was embattled, and formed a very large quadrangle; on one side was the beautiful church and cloisters, and near it a spacious refectory, of which some remnants yet remain: but

"All is silent now!—silent the bell
That, heard from yonder ivied turret high,
Warn'd the cowl'd brother from his midnight cell—
Silent the vesper chaunt—the Litany
Responsive to the organ—scatter'd lie
The wrecks of the proud pile, mid arches grey,
Whilst hollow winds through mantling ivy sigh—
And e'en the mould'ring shrine is rent away,
Where, in his warrior weeds, full many a hero lay."

It had been a day of high solemnity at the abbey, the day of commemoration of its foundation, when high mass was celebrated, and additional services were performed for the welfare of the founder and his family; many masses were said for the souls of those who fell in the field of Hastings, and a solemn requiem chaunted to their memory. The concluding service was yet unfinished, and the solemn strains of the vesper anthem were yet pealing through the cloistered arches of the magnificent pile, when a pilgrim, bearing in his hand a branch of withered palm—a token from Palestine—knocked at the gate, and craved hospitality for the night. Right readily was it granted, for never was the wayfarer sent unrefreshed from a convent gate. Christian—for he it was—was ushered into the strangers' hall, whilst the hosteler went to apprise the brotherhood of his arrival.

"A palmer from the Holy Land, and of gentle bearing, sayest thou? Nay, then," said the abbot, "usher him at once to our presence; right gladly shall we welcome him. The discourse of such an one must tend to edification, as well as being pleasant to the ear. And, hark thee, bid the cellarius add somewhat of daintier fare than ordinary to our evening refectory; if the wanderer be, as thou sayest, weary and worn, a little generous cheer shall not harm him."

The hosteler made his obeisance and withdrew.

"Ah, brother Ailric," said the abbot to an aged monk, who now entered the locutory, "I have right welcome tidings for thee; happy am I that thy return to Waltham was delayed for a day's space. There is just arrived at our gates a pilgrim of gentle bearing from Holy Land, who craveth hospitality for the night."

The monk started, and clasped his hands; but then, as if struck with the impossibility or improbability of his hopes, whatever they might be, he shook his head mournfully, faintly muttering, "Ah, no! Ah, no!"

"I thought," said the abbot, "all thy brotherhood

delighted in the Jerusalem pilgrims, and that at Waltham they were ever most munificently entertained."

"It is so, my Lord Abbot, and well may it be so, since rumour averreth . . ." But what Rumour, with her thousand tongues, had in this case to answer for, the abbot was not now destined to know, for at this moment, the hosteler entered, followed by Christian the pilgrim.

"Welcome, palmer," said the abbot, "thou bearest thy emblem from Palestine, I see. Thou art fatigued, and needest refreshment and repose, which shall speedily be afforded thee, and then gladly would we question thee touching thy adventures in that blessed soil (here the abbot crossed himself) where thou hast been abiding. Doubtless they are profitable to learn."

"I have indeed sojourned there many years," said Christian, in a somewhat broken voice; "and have returned to end my days in mine own soil."

The moment the pilgrim spoke Ailric started, and eagerly regarded him; and as he proceeded and spoke of his long absence, and of his returning to end his days in his own soil, the agitation of the monk became great, and must have been observed by others in the apartment had not their attention been entirely engrossed by the stranger. He subdued, however, and effectually concealed it; nor did he, during the remainder of the evening, even address the pilgrim.

When, after experiencing the most kind and courteous hospitality, Christian pleaded fatigue, and begged permission to retire to rest, he was conducted to a neat little cell somewhat apart from the general dormitory. The night was beautiful and summer-like; the moon was full, and bathing all the scene around in a flood of light. Christian extinguished the small lamp, which, as a visitor, was permitted him, threw open the little casement, and gazed around. Well had he known the scene with the exception of the precise precincts of the abbey, but the view from his little casement extended far beyond that. Slowly he turned his eye round, and mound after mound, and hill after hill, opened by degrees on his memory with all the distinctness of former days. And at last, as thought after thought awakened in his eye, his mind, his heart, at last he recognised—distinctly recognised—the spot where William the Norman stood ere he made his last and decisive charge.

"Where then was I?" murmured the agonized pilgrim, as he pressed his burning forehead against the casement, whilst busy thoughts and recollections were torturing his brain—"where then was I?"

Alas! too well he knew that the abbey, to see which an unconquerable impulse had urged him, was reared on the very spot where, defending his standard to the death, he had stood until cut down by Norman swords.

"I thought," murmured he, whilst scalding tears fell from his eyes,—*"I thought all these feelings were subdued, conquered, eradicated. Alas! alas! our Lady plead for me, weak, wretched worm that I am!"*

And again the poor pilgrim looked forth on the night, and his countenance gradually became tranquilized, his manner calm.

At this moment a gentle knock was heard at the door of his cell—he started—a slight matter alarmed his over-wrought feelings; he made no reply, and in a little while the knock was repeated, even more gently than before.

With a slight trepidation of manner the pilgrim opened the door, and there appeared the aged monk whom he had observed at the evening meal to be a visitor at the abbey. Ailric advanced, looked cautiously around, closed the door, and then, kneeling down, took the hand of the pilgrim, and reverently kissed it.

"What means this?" inquired the pilgrim, hardly able to articulate.

"My prince!" sobbed the monk, "my loved and honoured lord. Nay, sir," continued Ailric, as the pilgrim used some deprecatory action, "you need not attempt disguise, for I knew the first sound of your

voice, and my heart has throbbed with every word you have uttered."

"And who are you?" said Harold, in a husky voice, finding all attempt at concealment vain.

"Ailric de Childemaister, a poor monk of your own Abbey of Waltham, who accompanied you to the field on that fatal day."

"True, true; and I had ungratefully forgotten thee."

"Nay, my gracious prince, it was not to be supposed that you should remember one who was ever too humble to attract your notice. But I was not too humble to love you and to weep for you; and Heaven can bear witness how sincerely I have done both. Little did I think to live to see this day; Heaven be praised for its mercies,—I can now die in peace."

"But I thought my death was considered certain?"

"So it was, gracious sir, and we buried an effigy at Waltham to deceive the usurper; but a rumour was afloat among us that you were departed on pilgrimage to the Holy Land to fulfil a vow, before you returned to fight again for your kingdom. Mine old eyes will yet see you on the throne which the proud Norman thinks he holds so securely."

"Never—never!" said Harold, solemnly.

The monk started, and was about to speak, but Harold motioned him to silence.

"It was my purpose," said Harold, "after once more feasting my longing eyes with the view of my father's lands, and of this heath—(here he shuddered visibly)—it was my purpose to retire to some lonely cell, and in prayer and penitence to await that death, of the speedy approach of which I feel sure warnings—my former name and rank unknown to any one. This purpose I still hold. And I charge thee—I charge on the allegiance thou once owedst me—to betray my existence to no one; for behold," added he, throwing back his cowl for the first time, "I am, even as thyself, sworn to Heaven!"

The monk looked, but his fast-filling eyes could see nought but the diroful change which time, and sickness, and sorrow had wrought in the fine lineaments of the once noble prince.

"It is hard," said Harold, mournfully, "even now, when, as I call the saints to witness, no ambitious thought or wish dwells on my mind—it is exquisitely painful to rake from their tombs the buried hopes and wishes of bygone time; yet will I essay it this once, since it will be the last time, *save one*, that Harold will speak in his own person."

He seated himself on the side of the little pallet bed, and resumed:—

"Of that day, that fearful day, all that I remember is seeing Norman hands outstretched to my standard, which I rushed forward to rescue; and when—after what interval I know not—I found myself in an obscure tenement at Winchester, under the care of a cunning woman of the East, who prescribed for my wounds, which were desperate, with skill and care. Months passed away ere I was able to crawl over the floor, and not less than a couple of years had elapsed before I could attempt any plan for the recovery of my kingdom. In the meantime the worthy franklin who, at the risk of his own life, had borne me to concealment when he found I was alive, died. Many of the thanes and nobles to whom I had looked for help, had either submitted to the Norman, or been reduced by him. My mother, my noble-hearted mother, had fled to Flanders; my brave brothers were dead; my wife, my gentle and beautiful Editha—alas! alas! she died by me on the way—and I was alone!"

"Oh!" resumed he, after an agitated pause, "was not the finger of God in this? Whilst I lay helpless as a babe, my countrymen were enslaved; they had become, almost to a man, hewers of wood and drawers of water; and Norman power and policy were spread throughout the length and breadth of the land."

"What was I, that I should set myself against a sys-

tem which seemed like a decree from above, so speedily and so thoroughly was it established?"

"No:—I prayed for guidance, for direction, and it was vouchsafed. I threw the mail from my breast, the helmet from my brow, and I vowed myself to Heaven. Barefooted have I wandered over the Holy Land—I have knelt by the tomb of the blessed Son of Mary—I have watered the soil of Calvary with my tears. Penury and hunger, privation and want, I have often known; but utter misery never, until this sad night, when the ghosts of thousands, sacrificed to my ambition, seemed to arise in threatening array before me. Yet do I humbly trust that long years of penitence and prayer may not have been spent in vain."

"And now, my faithful friend, leave me: I am much exhausted, and would fain seek an hour's repose to prepare me for the morrow's travail. Yet does my vow forbid me to sleep after the second hour of the morn. Remember me, and pray for me; but breathe not my name to any. We meet no more on this side the grave."

With many prayers, and tears, and blessings, they parted. At daybreak Christian resumed his pilgrimage; and at a somewhat later hour the monk Ailric set out on his return to his own Abbey of Waltham.

When again at home, there was a peculiarity in his demeanour which often attracted the notice of those around him. He would look amazingly mysterious when certain subjects were broached, and screw up his mouth as if with a resolute determination not to speak; at other times, brimful of something, he would eagerly begin to speak, and suddenly break off in the middle of a sentence, as if he was proceeding unawares too far. On some occasions he would assume a most provoking look of intelligence, and smile, and hem, as if intimating, "What could I not say if I would?" and at other times the old man's eyes would fill with tears, his features would seem almost convulsed with emotion, and he would sit for hours apparently absorbed in intense thought. The brotherhood, at first disposed to be somewhat annoyed at these new and unaccountable fancies, observed that the abbot (to whom, of course, Ailric had revealed under the sacred seal of confession what he knew) always treated them with indulgence and a certain degree of respect; so at last they became indifferent to them, and said that "Brother Ailric was in his dotage." He was certainly of a great age.

Meanwhile Christian pursued his way, seeking some secluded shelter, but without any definite route, and indeed without having at all resolved on the place where he should lay up his rest. Moved, however, by an internal feeling, an irresistible impulse, he wandered to Chester; and when there, impelled by a sensation he could no way define, he was led to the churchyard of St. John the Baptist, on the river Dee. In a secluded corner was a solitary hut, probably the abode of a hermit, and thither he bent his steps for shelter. Knocking at the door of the shed, he received no answer; so, gently raising the latch, he entered, and found the inmate stretched upon a pallet, expiring. Christian rendered to him the last offices of humanity, and then, considering that the finger of Heaven was visible in the impulse which led him to this sequestered spot, he here laid up his staff.

Seven years elapsed, during which Christian remained the pious and contented inhabitant of this little hut, and then the warnings which he had long felt were verified, and a neighbouring priest was summoned to receive the dying confession of the hermit.

And then it was first discovered that he whose humble piety and meek and lowly demeanour had for so many years excited the veneration of all around, was none other than

HAROLD, the last Saxon King of England!

(1) This sketch may appear an extravagant fiction to those who are not aware that there is extant a *Life or Legend of Harold*.

FREDERICK HALM.¹

FROM A GERMAN MEMOIR.

FREDERICK HALM, or, properly, Eligius Francis Joseph, Baron of Münch-Bellinghausen, actual imperial and royal aulic councillor, and principal curator of the imperial and royal court library, was born April 2, 1806, at Cracow, which at that time was under the government of Austria. His father, Cajetan von Münch-Bellinghausen, was at that time member of the Council of Appeals there; and when, at a later period, he was called to the office of state-councillor and member of the Conference, and was honoured by the fullest confidence and especial favour of his late majesty the Emperor Francis I., he exercised decided and extremely beneficial influence on the judicial affairs of the entire monarchy. The son of so distinguished a statesman seemed pre-eminently called to be a statesman himself, and to this object he was trained with great assiduity and perseverance. Even in the boy, however, the poet, and especially the dramatist, became conspicuous; his propensity often discovering itself in the strangest manner, by the representation of Schiller's pieces on a chess-board, by dramatizing what he read, by animated *memoriter* recitations of favourite passages, &c. This inclination was fostered by diligent reading, and continued to express itself more evidently during the period of his studies. Thus, half living in his books, half in the poetical dreams of his youth, amid the calm retirement in which his father, partly from inclination, and partly from principle, educated him, he attained so early to mental maturity, that, in his twentieth year, he had finished his education, completed his first tragedy, entered on the service of the state, and married. Although this complete change in all the circumstances of his life, far from checking his poetical temperament, rather promoted it, yet, from a distrust of his own powers, he shrank from publicity, and scarcely imparted to his friends any portion of the fruits of his silent labours. At last, even he proved no exception to the principle that real talent is always associated with the desire of communication; and thus, encouraged by his talented and accomplished preceptor, Michael Enk von der Burg, he appeared before the public for the first time in the year 1835, the twenty-ninth of his age, with his dramatic poem, *Griseldis*. The effect which this piece produced at the imperial and royal court theatre is well known. In a short period it made the round of all the theatres, great and small, in Germany. A second dramatic production, *The Adept* (1838), and some subsequent performances, as, *Camoens* (1837),² *Inelda Lambertazzi* (1838), *A Mild Sentence* (1840), enjoyed an applause, though less impetuous, yet highly honourable to their author. His romantic drama, *The Son of the Wilderness*, was almost a more successful adventure than even his first two pieces. It went over every stage in Germany with the impetuosity of a tempest.³ His last original production is *Sampiero* (1844). In the meantime he published versions of foreign works, as *Cymbeline's Children*, after Shakspeare (1842), and, yet earlier (1841), *King and Peasant*, after Lope de Vega; to whose works, as to Spanish dramatic literature in general, his attention had been turned by his friend Enk, as a source of dramatic composition of surpassing richness, and very little cultivated. A fragment of another drama of Lope de Vega, *King Bembo*, which he contributed to the album of his excellency the prefect of the court library, Maurice, Count of Dietrichstein, excites a desire of the whole. For our

(Harl. MSS. 3776), which names many of the circumstances engrained in it. His being nursed of his wounds at Winchester; his pilgrimage; his yearning after his native land; his pious acknowledgment of an Almighty hand in the Norman Conquest; his assuming the name of Christian; and his death in a hermitage at Chester.

(1) We shall occasionally give extracts from the writings of this celebrated author.

(2) We follow the German exactly, but there must be a mistake.

(3) "In *Sturmschritt* über alle Bühnen Deutschlands ging."

acquaintance with a dramatic tale, intitled, *Sword, Hammer, Book*, apparently an early production, we are indebted to a fragment printed in the annual, *Remember Me*, for 1838. Without entering on a more minute examination of these poems, of which the greater part have sufficiently manifested their power and effect by not only keeping possession of the German stage, but also by translations into foreign tongues, we will only observe, in general, that Frederick Halm possesses the rare talent of combining poetical conception of the gentlest and noblest cast with the richest scenic effect; exhibiting a pure practical example that it is possible to write with a view to stage representation without any compromise of the dignity of poetry. On account of his important services to the German stage, he was presented in the year 1842, by the King of Denmark, with the cross of the military order of Danebrog; in 1843 he received from the King of Bavaria the order of merit of St. Michael; and in 1845 the Archducal Saxon order of the White Falcon of the first class. His minor lyrical and epic compositions, which, unhappily, he keeps too much to himself, are distinguished by fervour, vigour, elegance, and, above all, by a beautiful clearness of idea: among the few collections to which he contributed in this way may be mentioned the annual, *Remember Me*. In regard to the official position of this distinguished poet, from whom his country's stage is authorized to expect so much more of the beautiful and renowned, we remark that in 1840 he was called to the imperial and royal government-council of Austria, and in 1845 was appointed chief curator of the imperial and royal court library, with the title and rank of actual aulic councillor.

CURIOSITIES OF SCIENCE.

ANALYSIS OF GUN-COTTON.

M. SCHÖNBEIN has, at length, broken silence as to the history and constitution of gun-cotton. Careful analysis shows that the composition of gun-cotton differs considerably from that of xylordine; and that it is a compound poorer in carbon and richer in oxygen than the discovery of Bracannot; that, consequently, in burning it ought to produce more gas, have a greater explosive force, and leave less residue than gunpowder.

VAMPIRE BATS.

Dr. George Gardner, in his *Travels in the Interior of Brazil*, just published, describes these singular creatures as peculiar to the continent of America, being distributed over the immense extent of territory between Paraguay and the Isthmus of Darien, where they attack the fleshy parts of men, horses, calves, and pigs, and voraciously suck their fill of blood. They inhabit the limestone caves of the country, and constitute the genus *Rhylostoma*, so named from the leaf-like appendage attached to the upper lip. Their tongue, which is capable of considerable extension, is furnished, at its extremity, with a number of papillæ, which appear to be so arranged as to form an organ of suction; and their lips have also tubercles symmetrically arranged; these are the organs by which they draw the life-blood from both man and beast. These animals are the famous vampires of which travellers have given such redoubtable accounts, and which are known to have nearly destroyed the first establishment of Europeans in the New World. The molar teeth of the true vampire or spectre-bat, are of the most carnivorous character; the first being short and almost plain, the others sharp and cutting, and terminating in three or four points. Their rough tongue has been supposed to be the instrument employed for abrading the skin, so as to enable them more readily to abstract the blood, but zoologists are now agreed that such supposition is wholly groundless. Having carefully examined, in many cases, the wounds thus made on horses, pigs, mules, and other animals, observations that have been

confirmed by information received from the inhabitants of the northern parts of Brazil, Dr. Gardner is led to believe that the puncture which the vampire makes in the skin of animals is effected by the sharp-hooked nail of its thumb, and that from the wound thus made, it abstracts the blood by the suction powers of its lips and tongue. That these bats attack man as well as animals is certain; for Dr. Gardner has frequently been shown the scars of their punctures in the toes of many who had suffered from their attacks; but he never met with a recent case. The bats grow to a large size; the doctor having killed some that measured two feet between the tips of the wings.

EXTRAORDINARY MIRAGE.

About the middle of March, there was seen early in the morning, at Ulm, a mirage; the weather being clear and cold, and the sun rising brilliantly. From the point of the steeple of the cathedral of Ulm, rose a narrow ray, of a dark colour, almost vertical, with a slight inclination to the west. Near this ray the image of the upper half of the steeple was designed, with its tower, and all the numerous and delicate Gothic ornaments which decorate it on every side. This image was so correct that it might have been mistaken for a representation made by the Daguerreotype; and the phenomenon was repeated eight times.

"A BAD ROOM FOR HEARING."

Mr. J. Scott Russell has thus lucidly explained one of the causes of bad qualities in the construction of a room. He shows that in a large square room, of the usual form, the reflexion of the same sound is carried to the speaker's ear by different paths, and in different periods of time; the result of which is the confusion of successive sounds and syllables with each other, and so a prolific cause of indistinct hearing. It requires another principle to afford the remedy for these evils, which Mr. Russell believes to be quite new. He calls it the principle of *non-reflexion* and lateral accumulation of the sound wave. It was originally suggested to him by the observation of a similar phenomenon in the wave of the first order in water. This wave he considers to be the type of the *sound wave*; and on examination, he finds experimental evidence of the same phenomenon in the latter wave. He has observed that at angles below 45° , the sound wave is no longer completely reflected from the surface on which it impinges; and, that when the obliquity of the wave to the surface is 60° , a phenomenon follows of total *non-reflexion*, and the wave continues merely to roll along the surface in a direction parallel to it. This fact furnishes a ready means to remedy the evils so often produced by the reflexions, and echo, and interference of sound in public buildings. Wherever it is possible to place flat or curved surfaces at such angles that the direction of the sound shall be very oblique to the surface, it may be harmlessly disposed of, and prevented from injurious reflexion. This is exactly what the stalls of a choir, the side chapels of a cathedral, and the partitions of boxes in an opera-house, do so successfully for buildings of a large class. The same principle enables Mr. Russell to explain the whispering gallery of St. Paul's (which is circular), and another equally celebrated, mentioned by Saunders, which is perfectly straight. The same principle also explains the conveyance of sound along the smooth surface of a lake, and over the flat surface of a sandy desert; as well as the extraordinary reverberation or accumulation of sound in some portions of a building.

BABBAGE'S CALCULATING MACHINE.

The construction of a calculating machine, which truly deserves the name, was reserved for our distinguished countryman, Mr. Babbage. While all previous contrivances performed only particular arithmetical operations under a sort of copartnership between the man and the machine, in which the latter played a very

humble part, the extraordinary invention of Mr. Babbage actually substitutes mechanism in the place of man. A problem is given to the machine, and it solves it by computing a long series of numbers following some given law. In this manner it calculates astronomical, logarithmic, and navigation tables, as well as tables of the power and products of numbers. It can integrate, too, innumerable equations of finite differences, and, in addition to these functions, it does its work cheaply and quickly; it *corrects whatever errors are accidentally committed, and it prints all its calculations!* This grand invention of the age was, after much negotiation, patronized by the British government, and Mr. Babbage gratuitously devoted the energies of his mind to its completion; but the liberality of the state was not commensurate with the genius of the inventor. The government had contracted for the machine originally submitted to its notice. During its progress, Mr. Babbage invented one more perfect and useful, the construction of which required a fresh appeal to the Treasury, which has been refused. "Some Eastern monarch," says a contemporary, "intent upon glory, or perhaps, some democratic community in the far West, intent upon gain, may welcome and naturalise this exile of mechanism, and cheaply supply the navies of England with astronomical and nautical tables to guide them through the ocean." The Calculating Machine first named has been placed in the museum at King's College, London.

WEIGHT OF THE ATMOSPHERE.

Pascal shows that all the phenomena and effects hitherto ascribed to the horror of a vacuum, arise from the weight of the mass of air; and after explaining the variable pressure of the atmosphere in different localities, and its different states, and the rise of water in pumps, he calculates that the whole mass of air round our globe weighs 8,983,889,440,000,000,000 French pounds.

ABSENCE OF SNOW IN SIBERIA.

There is in Siberia, M. Erman informs us, *an entire district*, in which, during the winter, the sky is constantly clear, and where a single particle of snow never falls.—*Arago*.

GIGANTIC BIRDS' NESTS.

Mr. Gould describes the Wattle Talegalla, or Brush Turkey, of Australia, as adopting a most extraordinary process of nidification. The bird collects together an immense heap of decaying vegetable matter as a depository for the eggs, and trusts to the heat engendered by decomposition for the development of the young. The heap employed for this purpose is collected by the birds during several weeks previous to the period of laying. It varies in size from two to four cart loads, and is of a perfectly pyramidal form. Several birds work at its construction, not by using their bills, but by grasping the materials in their feet, and throwing them backwards to one common centre. In this heap, the birds bury the eggs, perfectly upright, with the large end upwards; they are covered up as they are laid, and allowed to remain until hatched; when the young birds are clothed with feathers, not with down, as is usually the case. It is not unusual for the natives to obtain nearly a bushel of eggs, at one time, from a single heap; and as they are delicious eating, they are eagerly sought after, as well as the flesh. The birds are very stupid, and easily fall a victim to the sportsman, and will sit aloft and allow a succession of shot to be fired at them until they are brought down.

DAVY'S VOLCANIC THEORY.

Potassium is lighter than water. It breaks into flame the moment it touches water or ice. If plunged into water, there is no combustion, but hydrogen is discharged without turbulence or resistance. These remarkable, but far from anomalous properties, suggested to the teeming mind of the electro-chemist Davy, the conjecture that the solid body of the world is composed of potassium and the metals that resemble

it; and that volcanized eruptions are produced by the occasional incursion of the waters of the deep, or of the great mountain-tanks, on the still domain of these atlantic metals. The far greater part of the investigated crust of the earth is certainly composed of such oxidated metals, and the specific gravity of the whole globe is supposed to be less than that of even the rocks; so that it is, at least, possible that there may be more of sound prediction in this sublime conception than the majority are inclined to think.—*North British Review*.

ATOMS OF THE ELEMENTS.

The fifty-five elements, in their simplest forms, are considered as minute particles, points, or atoms, each, according to its elementary nature, endowed with specific properties. So minute, indeed, are the parts of these elements in their ultimate state of division, in which condition they are usually termed *atoms*, as to elude all our powers of inspection, even when aided by the most powerful microscopes. Who can see the particles of gold in a solution of that metal in *aqua regia*, or those of common salt when dissolved in water? That respected veteran of science, the celebrated professor of chemistry in the University of Glasgow, has estimated the bulk of an ultimate particle, or atom of lead, as less than $\frac{1}{889,492,000,000,000}$ of a cubic inch; and concludes that its weight cannot exceed the $\frac{1}{319,000,000,000,000}$ of a grain!—*North British Review*.

"FOOTSTEPS BEFORE THE FLOOD."

"The historian," says Dr. Buckland, "may have pursued the line of march of triumphant conquerors, whose armies trampled down the most mighty kingdoms of the world. The winds and the storms have utterly obliterated the ephemeral impressions of their course. Not a track remains of a single foot, or a single hoof, of all the countless millions of men and beasts, whose progress spread desolation over the earth. But the reptiles that crawled upon the half-finished surface of our infant planet, have left memorials of their passage, enduring and indelible." As a moral lesson, the remark is beautiful and appropriate.

VELOCITY OF LIGHT.

Light moves through a space equal to the circumference of the earth in the *eightth part of a second*—in the twinkling of an eye. Could an observer, placed in the centre of the earth, see this moving light as it describes the earth's circumference, it would appear a luminous ring, that is, the impression of the light, at the commencement of its journey, would continue on the retina till the light had completed its circuit. Nay, since the impression of light continues longer than the *fourth part of a second*, two luminous rings would be seen, provided the light made two rounds of the earth, and in paths not coincident.—*North British Review*.

TEMPERATURE OF LONDON AND ITS ENVIRONS.

According to Howard, the mean temperature of London exceeds that of the neighbouring country about $1^{\circ} 8'$ Fahr.

DISTANCE OF THE EARTH FROM THE FIXED STARS.

The light of the sun takes 160 minutes to move to the Georgium Sidus, the remotest planet of our own solar system; and so vast is the unoccupied space between us and the nearest fixed star, that light would require *five years* to pass through it. But, as the telescope has disclosed to us objects many thousand times more remote than such a star, the creation of a new star at so great a distance could not become known to us for many thousand years, nor its dissolution recognised for the same length of time. Had the fleet messenger that was charged with the intelligence of its birth, or its death, started at the creation of the world, he would, at the present time, be only nearing our own planetary system.—*North British Review*.

LORD ROSSE'S LEVIATHAN TELESCOPE.

To the frame of this vast instrument is fixed a large cubical wooden box, about eight feet wide, in which there is a door, through which two men go in to remove, or to replace, the cover of the mirror. To this box is fastened the tube, which is made of deal staves, and hooped like a huge cask. It is about 40 feet long, and 8 feet diameter in the middle. The Dean of Ely walked through the tube with an umbrella up!

Dr. Scoresby, who has viewed the moon through this huge telescope, states that every object on the moon's surface, 100 feet high, may be distinctly seen. There are craters of extinct volcanoes, rocks, and numberless masses of stones; but there are no signs of habitations—no vestiges of architectural remains—to show that the moon is, or ever was, inhabited by a race of mortals similar to ourselves. It presents no appearance which can lead to the supposition that it contains anything like the green fields and lovely verdure of this beautiful world of ours. There is no water visible; not a sea, or river, or even the measure of a reservoir for supplying town or factory; all seems desolate.

NUTRIMENT IN COFFEE.

M. Rayen, from elaborate experiment, shows that coffee slightly roasted is that which contains the maximum of aroma, weight, and nutrition. He declares coffee to be very nutritious, as it contains a large quantity of azote; three times as much nutriment as tea; and more than twice the nourishment of soup (*bouillon*). Chicory contains only half the nutriment of coffee. M. Rayen has also succeeded in obtaining from coffee an extract in the form of a white crystalline substance, capable of giving a deep green colour to five thousand times its weight of water or spirit.

THE DOOM OF OUR WORLD.

What this change is to be, we dare not even conjecture; but we see in the heavens themselves some traces of destructive elements, and some indications of their power. The fragments of broken planets—the descent of meteoric stones upon our globe—the wheeling comets welding their loose materials at the solar furnace—the volcanic eruptions on our own satellite—the appearance of new stars, and the disappearance of others—are all foreshadows of that impending convulsion to which the system of the world is doomed. Thus placed on a planet which is to be burnt up, and under heavens which are to pass away; thus treading, as it were, on the cemeteries, and dwelling in the mausoleums of former worlds, let us learn the lesson of humility and wisdom, if we have not already been taught it in the school of revelation.—*North British Review*.

PREDICTION OF THE WEATHER.

M. Arago is decidedly of opinion that the influences of the moon and of comets on the changes of the weather are almost insensible; and, therefore, that the prediction of the weather can never be a branch of astronomy, properly so called. And yet, our satellite and comets have, at certain periods, been considered as preponderating stars in meteorology. Again, M. Arago believes that he is in a condition to deduce from his investigations this important result:—*Whatever may be the progress of the sciences, never will observers, who are trustworthy, and careful of their reputation, venture to foretell the state of the weather.*

CHANGE IN THE LEVEL OF THE CASPIAN SEA.

One of the most singular features in the ancient condition of the surface of the globe which modern researches have brought to light, is that exhibited by the region around the Caspian; affording the most unequivocal proofs of great changes in the relative levels of the land and water at a period geologically recent. Over a vast region, a calcareous argillaceous deposit exists in nearly horizontal stratification, abounding in fresh-water shells and others analogous to, and to a great extent identical with, species now living in the

Caspian, attaining, in some places, a thickness of 800 feet; which appears to prove that, at the time it was deposited, there existed an inland sea, of brackish water, exceeding in size the present Mediterranean, and of which the present Caspian is the diminished relic.—*The President's Address to the Geological Society, 1846.*

INSIGNIFICANCE OF MAN.

The Earth is 8000 miles in diameter; the atmosphere is calculated to be 50 miles in altitude; the loftiest mountain peak is calculated to be 5 miles above the level of the sea (for this height has never been visited by man); the deepest mine that he has formed is 550 yards; and his own stature does not average 6 feet. Therefore, if it were possible for him to construct a globe 800 feet—or twice the height of St. Paul's Cathedral—in diameter, and to place upon any one point of its surface an atom 1-4380th of an inch in diameter, and 1-720th part of an inch in height, it would correctly denote the proportion that he bears to the earth upon which he stands.—*Griffith's Chemistry of the Four Seasons.*

APPROACH OF ICEBERGS.

Icebergs sometimes cover immense spaces; we may, therefore, suppose that they sensibly disturb certain zones of the oceanic temperature, and then, by means of communication, the temperature of islands and continents. Thus, on March 28, 1818, in 41° 50' north latitude, 53° 13' longitude west of Paris, Captain Vivian felt, during the whole day, an excessively cold wind blowing from the north, which led him to suppose that ice was approaching. And, in fact, on the following day, he saw a multitude of floating islands, which occupied a space of upwards of seven leagues. "Many of these lands," says he, "were from 200 to 250 English feet high above the water."

DECAY OF THE TEETH.

Mr. Alexander Nasmyth considers that, in addition to the ordinary diseases of the teeth, called decay, the effluvia of social life, the almost exclusive and unremitting exercise of the mental faculties, and a consequently superinduced morbid, nervous susceptibility, cause disease to appear in the sockets of the teeth, which produces their expulsion, although the bodies of the teeth themselves may be perfectly sound. That peculiarity, of which both modern and ancient social life affords abundant examples, is frequently found to have existed in the sockets of the ancient Egyptians, but never to have been observed in races of men who have followed a natural course of life.

DECORATIONS OF THE NEW HOUSES OF PARLIAMENT.

THERE are few of our readers, it may be presumed, who have not, ere this, paid a visit to the new and magnificent palace in which the peers of Great Britain and Ireland are destined, we trust, through future ages, to deliberate in their wisdom, on all matters touching the weal and woe of this great kingdom. And amongst these numerous visitors we can scarcely imagine one in any degree capable of appreciating such things, who has not left this splendid creation of architectural genius equally surprised and delighted by the taste and judgment which could plan, and the skill which could execute, a whole so perfect even in its minutest detail. Considering, however, that the fine arts are certainly not indigenous to our country, we cannot but feel some little anxiety with regard to the decorations which are to complete this monument of national taste in the nineteenth century; and we have therefore read, with much interest, the report which the commissioners entrusted to decide upon these embellishments have just put forth. It is, no doubt, satisfactory to learn, that

Hampden, Lord Falkland, and Clarendon (a somewhat heterogeneous trio!) are "going on as well as can be expected" under the hands of their respective sculptors; and that eighteen brazen barons and prelates (we could scarcely have imagined so many, unless living specimens may be included) are to occupy the niches prepared for them in the new House of Lords, at the cost of £7,000.—a very moderate sum, it must be confessed, when we consider that it allows only 150*l.* for each individual, taking the clerical with the lay. We are told that, "it has been thought advisable to keep principally in view the expression of some specific idea, and its illustration by some well-known historic or poetic incident adapted for representation in painting." To judge how far these good intentions have been carried out, we cannot do better than extract the following observations from one of our leading journals. After mentioning that Marlborough and Nelson have been selected to fill two out of four pedestals in St. Stephen's Porch, while the compartments intended for painting are proposed to be dedicated to Peace and War; the article proceeds thus:—

"The subjects recommended for the decoration of the Hall of St. Stephen's are, on the whole, dignified and appropriate. An early Trial by Jury, the Signing of Magna Charta, and the Privileges of the Commons, asserted by Sir Thomas More against Cardinal Wolsey, are all calculated to keep in recollection the origin of many of the liberties that are to this day enjoyed. The corridors, from the Central Hall, it is proposed to decorate with paintings illustrative of the great contest which commenced with the Long Parliament. In order to accommodate prejudices which may still be in existence, 'an attempt has been made to do justice to the heroic virtues that were displayed on both sides.' Thus, we have a little Royalism on one hand, balanced by a little Republicanism on the other, but the latter, as it ought to be, is kept considerably subdued. The Central Corridor shall, it is proposed, illustrate the gradual progress of our institutions by paintings, exhibiting the contrast between the extremes of ignorance and enlightenment which Britain has experienced. We have Cook in Otaheite proposed as a corrective to the Phœnicians in Cornwall; a Druidical sacrifice debited to us, and, on the credit side, the English authorities preventing the sacrifice of a Suttee, while the exposure of Anglo-Saxon captives in the Roman market place is met with a set-off in the emancipation of negro slaves. We next come to the Upper Waiting-hall, where it is suggested that Chaucer, Spenser, Shakespeare, Milton, Dryden, and Pope, shall be admitted. That the poets should be confined to the Ante-Chamber, as if waiting for national patronage, is but too much in accordance with historical truth; but if accuracy is affected in a matter in which the nation has so much reason to feel ashamed, we must protest against the doubtful taste of proposing as subjects of historical paintings for the decoration of the Royal Ante-Chamber and the Royal Gallery, events that history altogether repudiates. Eleanor sucking the poison from the wound in her husband's arm is a pretty incident for a romance, but, unfortunately, it is almost certain that this heroic act of suction was never performed. Raleigh spreading his cloak as a carpet for the Queen forms a pleasing subject for an anecdote of gallantry, but its interest is destroyed when we remember that in all probability the thing never occurred.

"The only point of controversy which appears to have divided the commissioners, or rather to have cut off Sir Robert Inglis from the main body, has been his dissent from a resolution of his colleagues, to substitute Henri de Londres, Archbishop of Dublin, for William, Bishop of London, who was originally elected one of the eighteen metal notables intended to fill the niches in the House of Lords. Sir Robert Inglis has gone into a learned disquisition to show that Henri de Londres was less worthy than William to occupy a niche in the wall within the new palace at Westminster. While giving

every credit to the hon. baronet for his research into the character of Henri de Londres, we must candidly confess that the elaborate disquisition reminds us of the six-sheet octavo pamphlet, written by some enthusiastic syncretic to try and solve the doubtful question whether the husband of the nurse in *Romeo and Juliet* really was a 'ryght merrie manne.' Sir Robert has discovered that Henri went by the uncomplimentary nickname of Scorchvillain, from which it may be presumed that he was a desperate firebrand, and that consequently William of London ought to be preferred. Sir Robert is, however, in a minority, and Scorchvillain is destined to shine out from a nook in the House of Lords."

Let it not be supposed, however, from what has been here quoted, that we wish to speak in an unfriendly spirit of the labours of the Commissioners of Fine Arts, so far as they have gone. We do full justice to the taste and liberality displayed by them in their management of the important matters confided to their care; and we rejoice especially in the encouragement given to British artists by the principle of competition which they have adopted. The revival of the old art of fresco-painting, which has been in a great measure accomplished, in this country, under their auspices, is sufficient in itself to entitle them to the thanks of the present generation of their countrymen; and their selection of this style of painting for the decoration of these "storied" walls is most judicious. The subdued colouring harmonizes well with the rich tint of the oak, and the somewhat liberal proportion of gilding by which it is relieved, while it avoids entirely the gaudy effect which must have been produced by the stronger contrasts of oil painting. True it is that fresco requires the utmost correctness of outline, and that any defect in drawing obtrudes itself painfully upon the eye, when deprived of the veil which might be thrown over it by more brilliant colouring. This observation is exemplified in the large fresco which already decorates the House of Lords. The figure of Ethelbert appears to us decidedly faulty, the head being unnaturally small, and the stoop of the shoulders awkward in the extreme; and the hands of the otherwise beautifully drawn figure of St. Augustine are so ill defined by the shading, as to render it difficult to distinguish whether it is the right or left hand which he is about to place on the head of the king who kneels before him. These, however, are defects which belong not to the style, but to the individual artists, and when time and experience shall have matured their efforts in this so lately revived art, we do not despair of their producing frescoes of sufficient merit to entitle them to a place in the magnificent Hall of St. Stephen.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

LAYS OF MARRIED LIFE.

NO. I.—THE WEDDING DAY.

(H.)

I AM married! I am married!
Weep, ye flirting maids of Cam,
The deed is done, the point is carried—
What a lucky dog I am!
What a pleasant dream my life is!
(Best of dreams, because 'tis true!)
What a charming thing a Wife is!
(I almost wish that I had two!)

Noble brow of thought and feeling—
Lips whence music breathes her spell—
Cheeks whose blushes are revealing
What that music dares not tell—
Eyes, in whose blue depths divine, oh
Purest spirits deign to lodge—
All these beauties now are mine, oh
Marriage is a splendid dodge!

I'm so glad I fixed on Nancy!
Laura speaks so loud and quick,
Caroline quite took my fancy,
But her ankles are too thick,
Jane should be an hair's breadth shorter,
Helen is a size too small,
Rose I'm sure drinks too much porter,
Fanny is too thin and tall.

They all loved me—how intensely
Maiden ladies only know—
Oh, I pity them immensely,
They have much to undergo!
Such devotion, such attention,
Whispers, blushes, smiles, and tears;
But 'tis hardly fair to mention
All they do, poor little dears!

Nancy's hit the proper medium,
(What the French call *juste milieu*,)
Who could feel a moment's tedium,
Sportive Nancy, when with you?
Gentle, tender, soft, complying,
Yet not wanting intellect,
On my every glance relying,
Looking up with sweet respect.

How I wooed her, how I pressed her,
By one little word to bless,
On my bended knees addressed her,
Till the darling whispered "yes;"
Half a dozen men of fashion
All rejected for my sake,
To reward her soft compassion
What a husband I will make!

When she plays I'll turn the leaves, and
When she works I'll hold the skein,
Soothie her kindly if she grieves, and
If she laughs I'll laugh again;
Read aloud in rainy weather,
Give her up the easy chair,
Never smoke when we're together,
Nor at other women stare.

Every moment play the lover,
Let her have a female friend,
Never sleep when dinner's over,
Make her presents without end,
Pay her bills when she requires it,
Fill her purse with joyful haste,
Cut my hair if she desires it,
(But I know she's too much taste!)

Happy then, thrice happy we, love,
Thus to share so bright a fate;
Married life to us shall be, love,
One delightful *tête-à-tête*!
Turn we from the world's caressing,
From its pleasure, pomp, and pride,
To enjoy life's dearest blessing,
At our own belov'd fireside!

The Rustic Nurse.

FROM A DRAWING BY C. H. WEIGALL, ENGRAVED BY JAS. COOPER.

THE RUSTIC NURSE.

Our Illustration of this day so well tells its own tale as to need no remarks from us; for, although our little nurse seems much pleased with his change, we freely confess our thoughts were drawn to the more melancholy reflection that in these days children are too apt to be kept away from the Village School, to perform the part of the parent at home—a system equally detrimental to the interests of both old and young.

ON THE POETRY AND POETS OF THE AGE.

It is of a truth no easy task to set up a standard whereby we may judge of poetry and poets. If this were ever a difficulty in times past, how much greater has it become in these days, when opinion differs so widely as to the merits of various writers, and when every rhymester arrogates to himself a niche in the temple of the Muses. It is impossible in an article circumscribed as this must necessarily be, to enter fully into the niceties of such a question; but as the mariner voyaging over strange seas is enabled to estimate distances, and to tell by certain signs and tokens how far off he is from land, so, in a few brief remarks, the qualities that belong to this divine art may be enumerated, and allusion made to its most successful followers now living and speaking amongst us.

Never was there made a more barefaced attempt to foist a fallacy on the public mind, than in giving out that because a man could string together a quantity of words which should jingle harmoniously, he was worthy of being elevated to the rank of a poet. Facility of versification, and richness of invention, may be, and are, inherent in the true poet, but they do not of themselves constitute a title to that distinguished appellation.

There is something of a far higher origin wanting to complete the proper characteristic which distinguishes the man of genius from the mere maker of couplets. To this something it is almost impossible to give a name, and assuredly no easy task to afford the reader a correct idea of its literal meaning and intrinsic value. It speaks for itself in the verse of the poet; it is the reflex of the noble thoughts that have been engendered in his brain, and are revealed in glowing words, which shine upon man's spirit with the lustre shed from the bright halo of inspiration that glitters on the brow of truth—truth one and immutable—the same in every age and in every clime. We must recognise in the works of the real poet a thinking and an aspiring mind, and be able to trace his aspirations to the domains of the beautiful and the true. Poetry of the simply fictitious order, and which serves no useful end, is in our opinion scarcely deserving of the name, and may be laid aside with the other ephemera of its day. That the decline and fall of this species of versification is near at hand may be confidently predicted, and indeed is a consummation most devoutly to be wished. If it is an art which is to serve no purpose, let poetry at once be suffered to become obsolete and unknown, save in the fanciful imagery of some plaintive love-song. But poetry, beyond all other species of literature and the fine arts, has a natural tendency to elevate and exalt the sphere of a man's usefulness, and to free him from the

debasement of worldly pursuits. Poetry embodies the art of elevating the objects around and about us, of discovering and rendering apparent the beautiful in the familiar scenes of every-day life, of idealizing reality, so to speak; yet to be what it professes, it must ever speak of, and answer to the truth. It is not confined to mere utterings; it is seen and felt in a thousand objects of nature, which to the eyes of a prosaic, common-place mind, are mere rivers, woods, or fields, and nothing more. It is a fact that there are a great many poets amongst the mass of human beings, who are altogether unconscious of possessing one spark of this divine faculty. They see a beauty, and hear a music, to which they can give no name; they abandon themselves to a sense of pleasure in their admiration of things beautiful, but cannot tell whence it arises. There may be no expression in these men,—they may make use of no symbols and no types,—but, for all that, poetry lives and moves within them. Imagination is necessary for the poet to enable him to clothe his thoughts in words, and this is a gift of Nature's own bestowing, which no study can attain. Hence the poet as distinguished from the man in whom poetry lives; and thence it follows, that this art may be defined as the power of liberating one of the highest faculties of the intellect: not cabined or confined, but speaking very intelligible language, that shall vibrate through many hearts, and be listened to in all seasons and in all ages. For the real poet lives for ever; like our own immortal Shakspeare, "he is not for an age, but for all time." He receives from Nature an exquisite perception of the beautiful, and following out the just and unerring laws of compensation, this same Nature gives him a voice by which he shall benefit his fellow-workers in the paths of life, and this voice is expression, or, going farther, we may say *is poetry*. Of all the requirements which are specially needful for such a man, two must never be lost sight of—earnestness and truthfulness; for without these poetry were a mere wanton idleness, a soft delusion. Nothing contributes more to the rapture with which we hang upon the pages of Shakspeare, Milton, Byron, Dante, Homer, and Burns, than the certain conviction we possess that these men, each in his degree, were in earnest and spoke the truth.

Of the poetry and poets of the present day it is confessedly an ungracious office to speak; for opinions are still strangely divided as to the merits of several of our very cleverest writers. It would seem that an entirely new school has sprung up within the last few years, a school of a very different order to any that has preceded it. Its merits appear to consist in the elaboration of intense thought, and the power of clothing with a beauty all their own things of every-day life. To this may be added a high sense of the loveliness of external nature. Its chief defects consist of a too great disregard to the conventionalities of the world, an occasional looseness of construction, and in many places considerable obscurity. Wordsworth, who was never more read than he is at the present time, may be called the high-priest of this new fraternity. Of his longer poems we will not now speak; but upon the shorter pieces, particularly the sonnets, we must bestow our warmest eulogium. In this class of composition, he stands without a rival; in it he displays all the pathos and energy of a man of feeling, and of the most refined mind. We open the volume at random, and take the first verses that present themselves.

SONNET

ON SIR WALTER SCOTT'S QUITTING ABBOTSFORD FOR NAPLES.

"A trouble, not of clouds, or weeping rain,
Nor of the setting sun's pathetic light
Engendered, hangs o'er Eildon's triple height:
Spirits of Power assembled there complain
For kindred Power departing from their sight;
While Tweed, best pleased in chanting a blithe strain,
Saddens his voice again and yet again:

Lift up your hearts, ye Mourners! for the might
Of the whole world's good wishes with him goes;
Blessings and prayers, in nobler retinue
Than sceptred king or laurelled conqueror knows,
Follow this wondrous Potentate. Be true,
Ye winds of ocean and the midland sea,
Wafting your charge to soft Parthenope."

The late Thomas Hood, whose comic effusions have so often set the table in a roar, was very successful in this walk of poetry. We may instance his Sonnet on Silence as being a perfect model for the gentle craft; but as a specimen of his more general style, we will adduce this, his last dying inspiration—

STANZAS.

"Farewell Life! my senses swim,
And the world is growing dim;
Thronging shadows cloud the light,—
Like the advent of the night—
Colder, colder, colder still,
Upward steals a vapour chill;
Strong the earthy odour grows—
I smell the mould above the rose!

Welcome Life! the Spirit strives!
Strength returns and hope revives;
Cloudy fears and shapes forlorn
Fly like shadows at the morn,—
O'er the earth there comes a bloom;
Sunny light for sullen gloom,
Warm perfume for vapour cold—
I smell the rose above the mould."

Rogers, Moore, and Leigh Hunt, cannot be said to have any characteristics in common with this new epoch of the poetic art; therefore, on this occasion, we will not enter into their merits, which belong to a totally different order. Tennyson, among the writers of this school, however, claims a distinguished position, and deserves a more lengthened notice here, for his poetry is everywhere attracting general attention, and daily appealing, by its energetic beauty, to fresh audiences. In the verses of this poet there is an accumulative force, and apposite flow of rhythm, which will convert, in due season, even such of his readers as are most inclined to waver in their faith, and fall in their appreciation of his great genius. His verses will yet find an echo in many a young and susceptible heart. His sympathies are grandly felt and nobly expressed. If ever man possessed that which an American writer has designated as *over-soul*, it is this man. To quote is to mutilate him. He must be read, learnt by heart, studied, read again, and, more than all, *thought over*. Then will come a discovery of the natural beauty of his poetry. "The Two Voices," the "Morte d'Arthur," "Locksley Hall," "Mariana," "Dora," the "Day Dream," are all gems not easily matched.

"Yet I doubt not thro' the ages one increasing purpose runs,
And the thoughts of men are widen'd with the process of the suns."

No poet ever betrayed the effect of high thinkings so freely as this one. None ever concentrated beautiful ideas so thoroughly or so well. Nearly killed to him in style, is a lady who has lately entered the pale of matrimony, Mrs. Browning. In some of her compositions we are astounded at the force and fervour which glow and move in every line, and can scarcely be persuaded we are listening to chords struck by a woman's hand. Here, too, we trace the impressions produced by intense thought; and are charmed with the music of its melodious flow, and delighted with the very agreeable fancies we encounter at every page. The "Romance of Margret," the "Poet's Vow," and "Lady May," are examples of her great command of language and power of depicting emotion. It is to be regretted that conceits should so often mar the effect of many of her most pleasing verses, and the constant recurrence of forced rhythms, made-up words, and accentuated particles, is objectionable.

The poetry of Browning, the husband of this talented

lady, as exhibited in his "Bells and Pomegranates," and Sordello and Paracelsus, is in many respects very striking, but the obscurity which accompanies it detracts so much from its merits, that few persons are tempted to peruse it. Horne has done some wonderful things; his plays, and the epic "Orion," are as finely conceived as they are ably executed. He is gifted with a nice judgment, and can adapt his verses to the scene or time of their action with great facility and fluency.

Many passages in Taylor's "Van Artevelde" are equal to some of the best productions of our old Elizabethan dramatists. This author is peculiarly happy in delineating character, and in the episode which divides the two parts of his historical play, there are bits of exquisite imagery, which must delight at every fresh reading.

In thus reviewing what has been passing of late years in the regions of poetry, and noticing some of the leading minstrels of the age we live in, it must not for a moment be supposed that the subject has been otherwise than cursorily treated.

There are many meritorious authors, pilgrims bending their steps towards Parnassus, persons of genius, whose names and productions have not been here alluded to. The theme is one which embraces a number of remarks and observations, incompatible with the limits of a single article. The subject is a most interesting and attractive one, and increases in its importance to the literary world with every passing year; for education is making rapid strides throughout the country, and the knowledge of this great fact has a natural tendency to stimulate the mass of mankind to inquire who are the presiding spirits of the age. The question has been here mooted, and but imperfectly answered; still it is to be hoped that it may, in some slight measure, assist the inquirers who would investigate a subject of so lofty a nature.

THE MAIDEN AUNT.—No. IV.¹

CHAP. IV.

A sudden knocking at the door of the room relieved Edith from the necessity of answering this embarrassing question.

"If you please, ma'am, Captain Kinnaird is come, and wishes to see you before you go to bed."

Mrs. Dalton could not restrain a laugh at the alacrity with which her friend responded to this summons. "Good night," said she, kissing her, "you are *quitté pour la peur* this time, and when next I want to catechise you, I will take precautions against those stage surprises. I do believe it was preconcerted."

"Dear Mrs. Dalton, how can you—!" was Edith's not very intelligible answer. "I am only so very glad to see my brother again; it is six months since we met."

She wrapped herself in a shawl as she spoke, and hurried to the dressing-room to receive her brother, while Mrs. Dalton withdrew to her own apartment.

Kinnaird, having kissed his sister heartily, examined her closely by the light of the lamp, pronounced that she was somewhat paler than her wont, and that dissipation did not agree with her, asked a few scattered questions relative to her proceedings for the last six months, and volunteered a vast quantity of rambling, rattling, and involved information relative to his own, professed himself tired, and wished her good night. But Edith lingered by the table with his candle in her hand, which was assuredly longer in getting lighted than ever candle was before. At last she said abruptly,

"I hope, Frank, you didn't forget my birthday."

"To be sure not, darling," was his rejoinder. "It is just a fortnight since; I was in Wales, drank your health in the very best Château Margaux it ever was my luck to taste. I suppose you are in a hurry for your birthday present," he added, laughing, "but you must wait till my portmanteau is unpacked. When a young lady like you attains her majority, you know, one can't pay

homage to her with a mere trifle, such as one may carry in one's pocket."

"Yes,—I am twenty-one," said Edith, sighing.

From the moment in which childhood leaves us, we begin to count our birthdays with sighs instead of smiles. They are involuntary pauses, forcing a consciousness of life, even upon the giddiest,—steps are they in the ladder of time, and whether we consider them as leaving the past, or leading to the future, the thought is equally sobering. But Satan's great aim is to paint our life's picture for us without any shadows; where he cannot eradicate them, he gilds them over; well knowing that so he shall destroy the proportions, and confuse the conception of the whole,—overpowering the bright composure of the everlasting sky by the gaudy and obtrusive splendours of earth. And so the healthful solemnities which God has provided for man are by man forcibly transmuted into festivals; so we celebrate a baptism by a dinner-party, and build an hospital by a ball!

Kinnaird looked earnestly at his sister, and then, with his customary straightforwardness, answered the question which he believed to lurk in that sigh. "It is a month since I heard from Everard," said he. Edith started at the name; the idea of the person whom we love is, as it were, compressed, and centred in the name, and so the heart shrinks from it, even when most familiar with the thought which it implies; just as a single speck of intense light will force tears from the eyes which could gaze steadily at the same amount of brightness spread over a larger space.

"He was at Marseilles when he wrote," continued Frank, "and must have been detained, or he would have been home long ere this. I wrote you word I had heard from him, from Marseilles."

"You did," answered Edith, as she moved towards the door. "Good night, Frank," added she, hurriedly and with averted face, pausing as if for a moment ere she left the room, "You never tell me anything about these letters. What does he say of me—of our engagement?"

The words were almost inaudible, but, even so, it cost Edith much to utter them. During the last three years she had regularly received from her brother notice of all Everard's proceedings, as reported in his own letters; but not one word of herself, not one allusion to their engagement. For some time she attributed this to delicacy or thoughtlessness in Frank; then she tried to break the oppressive silence by hints or allusions, but in vain. She could scarcely have given any tangible form to her suppositions, but there could be no doubt that her vanity was piqued, and the fortnight which had elapsed since her twenty-first birthday, without bringing any tidings of Everard, had not helped to soothe it. At length she was resolved to ask the question; and the embarrassment immediately visible in her brother's face made her heart stop suddenly in its beating, as if a hand had laid cold grasp upon it.

"Oh," replied he, with a little hesitation, "I always give him full particulars concerning you; and as to the engagement, you know, he does not say much about that, because, you see, he takes it for granted;—it is a thing understood—a matter of course."

"Good night," repeated Edith, as, with a flushed face and a step of unwonted stateliness, she left the apartment.

Frank Kinnaird's embarrassment was genuine and profound. The fact was, that, during the whole course of their correspondence, Everard had never once mentioned Edith's name. It is true that Kinnaird had always given abundant information concerning her without waiting to be questioned, and though puzzled by such unbroken silence on a subject so interesting, he had satisfied his own mind by the reflection that Everard was "an odd fellow, who never felt or acted exactly as other men did, and he must be allowed to go his own way." But he did not think those considerations at all

likely to satisfy the mind of Edith, who, in Mrs. Dalton's words, was "a woman most unlikely to forego her sex's privilege of being wooed." The manner in which he evaded her question was, however, much less calculated to satisfy her than a simple statement of the fact. The severity of reserve bears witness to the strength of the feeling which it is intended to restrain: a cord may bind a child, but you need chains of iron to fetter a man. Absolute silence may be more expressive than the most eloquent oration;—but small talk seems to be expressive of nothing but indifference. The conclusion which Edith carried away from this conversation was, that Everard had alluded to his engagement in terms so light, so cool, and so easy, that her brother did not like to report them to her.

It is singular how close the union, how strong the affection between brother and sister may be, without their even approaching to a comprehension of each other's characters:—without the smallest admixture of that sympathy, which, as has been before said, is the basis of friendship. One kind of sympathy, indeed, they must necessarily possess; they must be ready to weep for each other's sorrows, to rejoice in each other's happiness,—but this, perhaps, without any quick perception of the personal causes which deepen either the joy or the grief. The bond between them is one rather of habit than of instinct, and differs herein most conspicuously from the love of parent and child, which is a part of the life of the heart, acting by secret unisons and spiritual accordances which cannot be put to silence, save by breaking the strings on which they vibrate. Not that this deeper union does not frequently exist in the case of the other relationship to which we are adverting, giving birth to a holy and tranquil friendship, whose sanctuary no light thought or evil doubt is suffered to profane. We are rather calling attention to the fact, that it is quite possible for a very strong, warm, and even tender affection to exist without it. It is quite possible to love a brother with your whole heart, and yet to feel that he is as far from conjecturing what passes in that heart as the stranger to whom you were introduced yesterday.

Now, Frank Kinnaird's affection for Edith was precisely of this latter description. He was proud of her, and fond of her,—nay, he positively doated upon her: yet if he had been asked to name any of the particulars which individualized her character, and caused her to differ from other women, he would have answered by a most blank silence. His notions of women in general might have been worth a passing examination, if it were not that he shared them in common with so many of his sex: a heterogeneous compound they were, full of startling contradictions and pleasant inconsistencies. He had a strong theory that woman was a ministering angel; combined with a more practical belief that she was a domestic animal, and a vague doubt whether she really had any more soul than a kitten. Intellect he considered decidedly disadvantageous to her; yet it did not appear that he sought the society, or enjoyed the conversation of those who were destitute of such a portion of it as he was capable of appreciating. Self-dependence in a woman he vehemently detested; yet no one could be more utterly bored by the practical results of the opposite quality, except in the case of the individuals who, for the time, occupied his fancy and commanded his attentions. Intense, but not ungraceful vanity, a kind of shallow tenderness, abundant in tears, but unprepared for sacrifices, a pretty alacrity in white lies and innocent deceptions—these were, according to him, marks of the sex too indisputable to require discussion; and there is scarcely any imaginable instance of frivolity or falsehood which would not have elicited from him the appropriate comment, "What a thorough woman!" Nevertheless, no one could more readily recognise the merits of such particular instances as came under his personal observation; no one more indignantly testify to disparities, moral or intellectual, between

wife and husband; no one more cordially pity the former,—more earnestly condemn the latter, when the case demanded it. But his admiration for excellencies in women arose out of his natural love of whatever was good or noble; his leniency to their faults, out of the poverty and meanness of his ideal:—what woman would accept such charity? Nor let it be supposed that in this any special censure on Frank Kinnaird is intended; like most other men, he had never taken the trouble to combine his scattered opinions, so as to detect the unreality of some and the inconsistency of all. And we suspect that if this operation could be performed on the opinions of most other men, the result would be a theory not very unlike that which we have just described. And what, after all, does it signify? If the harp have three octaves, the most pertinacious playing, for a lifetime, on three notes, has no power to reduce the compass of the instrument. True, the useless strings may grow untunable, and return discord instead of harmony to the careless touch; but there they are still, undestroyed, for good or for evil; there they are still, and the various melody and the rich concord still sleep in them, ready to awake beneath the hand of a skilful player.

Thus much it has been necessary to say in order to explain what followed upon Frank Kinnaird's arrival at Selcombe Park, and to account for the view which he took of Edith's conduct. He immediately perceived that she was, to use the fashionable phrase, *firting*, to no inconsiderable extent with three gentlemen at once. Jealous for his friend, whose faith it never once occurred to him to doubt, and with whose fastidious delicacy he was well acquainted, he became angry with Edith, and he showed his anger in the most injudicious manner possible. His sister was a spoilt child, wayward, high-spirited, and vain; she had been breathing an air artificially softened for three years, and it would have required the most gradual tenderness to accustom her to a healthier temperature:—Frank took her out in an east wind at once, and then was astonished that she caught cold. Though undisciplined in mind, she was full of generous and noble feelings, and an affectionate and judicious friend might have moulded her as he pleased; but the idea that she was doing wrong,—that her frivolous and useless life was a perpetual sin,—that her constant and unintermitted intercourse with the world,—even with the *amiable* world, was unconsciously lowering her principles and injuring her character, had never once occurred to her; and now, on a sudden, she found the brother whom she had always hitherto ranked as one of her warmest worshippers, encountering her with a most unreasonable petulance, with an apparent resolution to disapprove all she did and dispute all she said, with those broad rebukes and unsoftened taunts which the freedom of family intercourse is sometimes supposed to sanction, but which sadly rub the bloom from family affection. Was it wonderful that she was exceedingly indignant, and felt herself extremely ill-used? Nay, was it unnatural that she pertinaciously resolved to follow her own way? that she made an object of what had hitherto been only an amusement? that she rather studied to exhibit the pleasure she took in the attentions of her admirers than to withdraw from those attentions, and assume unconsciousness of them? Several days passed, and matters seemed rather to get worse than to improve; there was still no intelligence of Captain Everard; Edith continued to amuse herself and provoke her brother, and the latter, growing more and more surly, resolved at last upon an open remonstrance.

"Edith," said he, encountering his sister in the hall, as he was seeking her for this purpose, "will you come and walk with me in the garden? I have something to say to you."

Edith's rapid step was checked in an instant. "Have you letters?" asked she hurriedly.

"No, no; but I particularly want to speak to you."

"Out of the question!" cried she gaily, "I am going

to give Mr. Thornton a German lesson, and shall not be at leisure for at least an hour. If you have anything very particular to say, tell me now—quick—this instant, for my pupil is waiting for me!"

"Your pupil is, of course, a person of far greater consequence than your brother," said Frank, with that sour kind of playfulness in which the joke is only assumed for the privilege which it gives the speaker of saying far ruder things than he could possibly say in plain earnest.

"Oh, I see you are cross!" returned his sister; "how glad I am that I have got an engagement! Anything is pleasanter than being scolded. I hope by the time I am at your service you will be in a better humour;" and, with a curtsy of mock solemnity, she darted away into the library. Kinnaird stood still for a moment, feeling most disproportionately angry, and then slowly followed her, and betaking himself to an easy chair and a newspaper, watched with no indulgent eyes the proceedings of the two students. A formidable array of grammars and dictionaries lay on the table as a sort of challenge to the whole world to disprove that they were going to study; Halm's "*Son of the Desert*" was open before them, and from this they read alternately, Edith occasionally supplying her pupil (whose knowledge of the language seemed scarcely inferior to her own) with the meaning of a word.

"I wonder how that play would act," said Mrs. Dalton, who was playing *chaperone*, as they closed the book. "Exquisite as it is, and full of truth and pathos, the unity of interest is so unrelieved that it is scarcely dramatic."

"Oh, that is the very peculiarity in which I delight!" exclaimed Edith; "there is a kind of repose, even in passion when it is uninterrupted; episodes and contrasts do jar so with one's feelings when they are really interested. I cannot endure that perpetual recurrence of an under-plot, or another set of characters, when the first conception has been grand, and true, and simple. It is as if you were to paint every alternate figure in a frieze by way of relieving the eye from the glare of white marble."

"No," said Mr. Thornton, "don't paint the figures, but paint the background, if you please; the white figures of the Parthenon stand upon a ground of pure blue. In the episodes and underplots which have disgusted you, the fault lies in the *execution*, not the *idea*, for it is only by contrast that unity becomes salient. 'Unity in multiplicity' was the old Italian definition of beauty, and we shall not easily find a better. You can trace a silver thread in a crimson web, but make the whole fabric crimson and the separate filaments are no longer to be discovered."

"But is not the life that one lives background enough to throw the conceptions of art into most bold relief?" inquired Mrs. Dalton; "not blue, truly, but russet or lead colour."

"There is truth in that remark," said Mr. Thornton; "and perhaps that is the reason why, when daily life has attained the acme of civilization, that is to say, of artificialness and corruption, art seems to assume a second childhood, as if in despair at its own decrepitude. Vast and complex creations appear no longer possible; we have a new generation of lyrical poets, and we have the lyrical spirit in all art, differing, however, from its earlier manifestation as the twilight of evening differs from that of morning; the one hurries into day, the other lingers into darkness. Simple forms, and short but lofty flights, are the true artist's only refuge from the wearisome varieties of reality as it exists now."

As he spoke he was carelessly turning the leaves of the book, and, lighting upon Parthenia's song, he handed it to Mrs. Dalton with a look of entreaty. "Sing it in English," said he. She complied, and the rich notes of the simple but passionate melody, rang through the room, with a tone irresistibly saddening, though the expression was rather wistful than melancholy.

My heart, I bid thee answer!
 How are love's marvels wrought?
 "Two hearts, by one pulse beating,
 Two spirits and one thought!"
 And tell me how love cometh?
 "'Tis here!—unsought—unsent."
 And tell me how love goeth?
 "That was not *Love* which went."

"The quiet, almost arch gravity of the last line is inestimable," cried Thornton as she concluded.

"How exquisite," said Amy, "is that first scene in which Parthenia teaches Ingomar the use of beauty, if I may so express it. The wreath upon the vase—how often one thinks of it! how often in life do we find the vase without its wreath, or the wreath withered and scentless!"

"True," replied Thornton. "Here, as ever, in real art, the story is but a parable. We are first taught that Beauty makes Truth loveable, and afterwards, that without Truth she is worthless. Nay, that she is not Beauty at all. The noble savage has to learn softness and refinement, and afterwards how do the conventional softnesses and hollow refinements of artificial life crumble beneath his touch, and do him involuntary homage!"

"Oh, don't make it into an allegory!" pleaded Edith, "you will philosophize away the deep personal interest and pathos of the tale. Who could see without tears that last sudden outburst of devotion and reverence in Parthenia, when, having played at goddess and teacher all the way through, she suddenly recognises his immeasurable superiority, and, without a fear or a scruple, prostrates her whole being before him? It shows how often coldness—immovable, unloveable coldness, is only on the surface; how there may be not only keen tenderness, but passionate fervour of character beneath it!"

"But I like the fervour which shows itself," cried Thornton, glancing at Edith's beautiful and animated face. "Coldness is, as you truly said, utterly unloveable. Feeling may hide itself when it pleases under satire, or wit, or playfulness, and be only all the more attractive; it is for ever letting the veil slip a little aside and giving you an instant's peep at its real face. But, once let it wrap itself in the pall of coldness, and (though this may perhaps be its only refuge on account of its very earnestness) it will never win hearts. At least it will never win my heart;—I have not faith enough to believe in that which I don't see, and which, moreover, is not even suggested to me."

"And so," said Mrs. Dalton, "the very temperament which most needs sympathy is, by its own constitution, irrevocably shut out from it!"

"That is hard," said Edith.

"It can't be helped," returned Mr. Thornton. "It is so, and will always be so. Some people are born to suffer—others to enjoy; some to win love without seeking it, and others—"

"To die for want of it," interrupted Amy, "like plants without water."

The conversation was here brought to a sudden pause by the announcement of visitors, Mrs. Willoughby and Miss Brown. They entered; the former a portly personage, erect even to painfulness, but with a deliberate activity of movement that was the very reverse of stately. Each motion was, if I may so express it, a dignified jerk. Her dress was exceedingly handsome, and her face bore the traces of considerable beauty, but there was invincible vulgarity in the expression of the mouth, and her manners had that conscious and elaborate affability which is incompatible with high breeding, and which, by the force of its very graciousness, makes every body else feel shy or proud, according to temperament.

"Mr. Thornton," said she, approaching him with a glide and a bend, "I believe I may claim acquaintance with you." Here she vouchsafed an action—brief,

chilly, and tremulous, which she considered in the light of shaking hands. "Allow me to present my young friend—Miss Brown."

Miss Brown, a plain, pale, awkward girl, shabbily dressed, and wholly uninteresting, retreated with an embarrassed curtsy, and seated herself out of reach as quickly as she could.

"Will you introduce me?" continued Mrs. Willoughby, with a glance at the ladies. Mr. Thornton, bored, but polite, complied with this request, and the visitor proceeded, "My errand here was to ask permission to see a portrait, which I understand that you have just finished. I hope,"—looking comprehensively at Mr. Thornton and Edith,—"*I hope I am not asking too much.*"

"If Miss Kinnaird has no objection," said he, hesitating. Miss Kinnaird, of course, could have none, and the picture was produced.

"I am no critic," said Mrs. Willoughby, with a deprecatory wave of the hand, as if she had received a compliment. "Indeed, I know nothing whatever of painting; I never had a lesson in my life." She looked anxiously towards Miss Brown, but as that young lady remained perfectly silent, she was reluctantly compelled to do the honours to her own untaught genius. "I believe, however," she added, "that I have a correct eye;—that, you know, is quite a gift—it cannot be acquired—it is quite a gift."

This was so decidedly addressed to Mrs. Dalton, that an answer was inevitable. "Quite," said Amy, scarcely opening her lips: she was not practised in that peculiar species of self-discipline, the result of which is universal courtesy.

"Yes," responded Mrs. Willoughby, with animation, "the most ignorant person, who happens to have a correct eye, may often be—at least I have been told so—a very useful critic. Some artists have told me that they would rather receive that kind of criticism than any other."

Mr. Thornton did not look as if he sympathized with those artists; but he could do no less than say that he should be much obliged by Mrs. Willoughby's comments.

The lady instantly became more impressively modest than before. "Oh! no, Mr. Thornton," said she. "I could not presume,—it is not as if I painted myself. I am wholly incapable of criticizing, as far as any real knowledge of the subject is concerned. But a correct eye, you know, is quite a gift. I should be able to tell you directly if the mouth were not quite straight, or if the outline of the face were a little out of drawing, or if one of the eyes were a little too large—that I should find out in a moment. But I am no critic,—that sort of faculty is quite a gift, you know. *You know?*" reiterated Mrs. Willoughby with emphasis, and interrogatively addressing Mrs. Dalton.

"Yes," said that lady deliberately, with an exterior politeness thinly concealing contempt.

"Now, I dare say," proceeded Mrs. Willoughby, "that in an exhibition—in any large collection of pictures, I should fix at once upon those that were really good. Probably I should distinguish an original from a copy at a glance,—yes, at a glance; but I could not tell you *how* I did it. I could not give you the *reason*,—that is what connoisseurs can do, and I am anything but a connoisseur. I have no technical knowledge; I have only an accurate eye, which, you know, does not depend upon study,—as I said before, it is a gift."

There was a pause after this speech, and the silent portrait seemed pleading to be looked at. Mrs. Willoughby approached it, and stood for some minutes in contemplation. "Do you think it like?" asked Mr. Thornton at last. (We should like to be informed on good authority, whether an artist is ever wholly and really indifferent to the opinion pronounced on his work by *any one*; whether he does not experience an emotion, either pleasurable or painful, even when the verdict proceeds from one whom he deliberately holds

to be utterly incapable of judging. Scorn, be it remembered, is not indifference,—though we do not pretend to define what it is.)

"Oh, undoubtedly," she replied. "A most admirable likeness. Miss Kinnaird, you must excuse my staring—the forehead is absolutely perfect."

Edith blushed under the oppressive gaze, and Mr. Thornton laughed, but not offensively.

"There cannot be a doubt of its being an excellent likeness," pursued the fair critic; "but yet—my unfortunate eye—it is quite a trial to be so accurate,—one sees the least little divergence from the right line in an instant. But it is very presumptuous in me to say so; I have no doubt that it is perfectly correct."

"Pray, say exactly what you think," said Mr. Thornton, with stately deference to the lady's correctness of eye.

"Well, if you really ask me," returned she, "if I may indeed venture, I should say that the curve of this left nostril comes just a hair's-breadth too low—there—pray be careful,—scarcely a touch will do it. (He had taken a brush in his hand and approached the portrait.) One little tiny stroke, you know, makes all the difference in these cases. Ah—h! (a prolonged sound of intense satisfaction.) There it is! You have done it exactly. Wonderful!—and the corner of that eye,—do you see what I mean? Raise it the least little bit in the world;—pray, don't suppose that I am criticizing. I know very well that I am quite an ignoramus;—only you see (with an appealing look to the ladies) Mr. Thornton is so excessively good-natured—he encourages the most timid person to speak her mind plainly. There! I see in an instant that you have done what I wanted to the eye;—is it not extraordinary what a change of expression is produced by a single touch!—one would scarcely believe it. Yes; now the portrait is perfect,—it does not look like the same picture. Surely, Mr. Thornton, you must be struck by the improvement, yourself!"

"I am perfectly satisfied with the likeness now," returned he, with a courteous bow; at the same time silently directing Edith's attention to the fact, that the brush with which he had executed the lady's suggestions had no colour in it. The completeness of her self-satisfaction did not allow her to perceive the equivocal nature of his reply. She had so perseveringly taken it for granted that he was encouraging her, that she could not possibly have suspected herself of impertinence. "Well, you see," said she, with a self-congratulatory nod, "even the most ignorant people may sometimes be useful to the most learned. The mouse and the lion, you know! But I was really frightened when I saw you beginning to touch it. I quite longed to take the brush out of your hand. When one sees so *exactly* what is the change required, and when the change itself is so *excessively* minute, one is afraid to trust it to another person, you know."

"Afraid to trust it—another person," muttered Mr. Thornton, in an aside to Edith, "I wonder whether I *did* paint the picture—I believe she thinks *she* did it."

"And now," resumed Mrs. Willoughby, with a decided access of graciousness, "will you allow me to speak of another errand which I have to you, Mr. Thornton? I have some drawings here for your inspection." She took from the table a portfolio which had been brought after her by the servant, and began to untie the strings.

"Are they your own?" inquired Mr. Thornton, as calmly as he could, but with an expression of some alarm.

"Oh no! How could you suppose it! I do believe you are quizzing me. You know I am no artist myself, though, as you have seen, I have some little capacity for art. These are the productions of a young friend of mine; a *protégée*—in fact (lowering her voice and speaking rapidly); the family are in most reduced circumstances, and this girl has shown immense genius—

something quite out of the common way. She is very timid, and they have no interest themselves, poor things! so I have brought her drawings to you, to ask your candid opinion of them. I assure you her genius is quite extraordinary; and she looks forward to supporting herself and her family by her exertions as an artist."

Mr. Thornton turned over the drawings rapidly,— "Ha!—not so bad—not so bad," he said, as he glanced at them in succession, "My dear Mrs. Willoughby, these are cases in which I always speak with perfect openness. Your young friend has a very pretty talent, and would do herself much credit as an amateur; but there is nothing like genius here; nothing that would justify me in recommending her to follow art as a profession. She would be only preparing disappointment for herself, and wasting time which might be far more usefully employed."

"Oh,—you think so," said Mrs. Willoughby, with a blank look, and an utter change of tone. "It is her only resource: they have scarcely bread to eat."

"She would never earn bread as an artist, I assure you," returned he, very decidedly. "Let her do plain work, or give drawing lessons to beginners; she might possibly be equal to that. But I do assure you, that you will be no friend to her if you encourage her to imagine herself a genius."

"I am afraid you are ill," said Edith, kindly, to the silent Miss Brown, whose increasing paleness had attracted her attention.

"No, thank you," was the scarcely audible answer. She made an effort to rise, but fell back, and in another moment Edith perceived that she had fainted. All was confusion: bells were rung and essences produced. Edith supported the invalid's head and untied her bonnet, while Mrs. Dalton threw water in her face and held salts beneath her nose.

"I suppose it was too much for her, poor thing!" said Mrs. Willoughby, pompously, but not unkindly. "These are her drawings, you know; and she has been quite living on the thought of being an artist ever since she was old enough to think at all."

"Good heavens, how brutal!" cried Thornton, sadly forgetting his good breeding, in the keenness of a compassion somewhat unusual from man to woman, when the object of it has neither beauty, talent, nor rank to recommend her.

"Nay, do not reproach yourself," said Mrs. Willoughby, instantly affixing her own interpretation to the sentiment. "It is much better, you know, that she should hear the truth at once."

"Take me to mamma," said the poor girl, faintly, half opening her eyes.

"Come, come, my dear, you mustn't give way in this manner. Exert yourself, there's a good girl; you are making yourself quite ridiculous.—It's always better to scold them a little when they are fainting or hysterical," said Mrs. Willoughby, in an audible aside to Mr. Thornton, and with a little confusion among her pronouns, "but it is a hard trial for her, though, of course, it's all for the best. People do deceive themselves as— one's own kindness deceives one, and blinds one's discernment in these cases."

KENILWORTH CASTLE.

AND is this all that remains of the princely castle of Kenilworth? Even so; in contrast with its neighbour, the stately castle of Warwick, "that fairest relic of ancient and chivalrous splendour," which yet remains uninjured by time.

Still, of all the antiquarian piles in Warwickshire—and it is rich in these remains, perhaps, beyond any other district of England—none are more attractive

than Kenilworth Castle, which is situated near the centre of the county, between Warwick and Coventry. As in most cases, a town has risen around the castle; but this has been the work of centuries, as a glance at the history of the fortress-palace will show.

The manor of Kenilworth was an ancient demesne of the crown, and had a castle, which was demolished in the war of Edward Ironside and Canute the Dane, early in the eleventh century. In the reign of Henry I. the manor was bestowed by the king on his Lord Chamberlain and Treasurer, Geoffrey de Clinton, who, about 1120, built a strong castle, and founded a monastery here. This was, indeed, a castle-building age, when the security of England's nobles lay chiefly in strong walls and vassalage, a state of society known only to us by the axiom, "An Englishman's house is his castle," used to denote figuratively the peaceful security of our times.

The castle and manor of Kenilworth having reverted to the royal possession, they were given by Henry III. to the famous Simon de Montfort, a Frenchman by birth, but who, in right of his mother, had succeeded to the English earldom of Leicester; and, in 1236, had married Eleanor, Countess Dowager of Pembroke, and a sister of King Henry. The castle was conferred for the lives of the earl and countess; they enjoyed a long course of court favour, but at length De Montfort quarrelled with his brother-in-law in 1262, and although they were apparently reconciled, it is probable that the feelings then excited were never extinguished in either. De Montfort espoused the national liberties, and, with his friends, compelled the nominees of the king to relinquish their functions and fly from the kingdom; but dissensions breaking out in the dominant party, the king regained his supremacy, and De Montfort himself was obliged to take refuge in France. On his return to England, the war was renewed, and De Montfort and his son Henry were slain at the fatal battle of Evesham, A.D. 1265. In the struggle that followed, the castle of Kenilworth was held out six weeks against the king by Henry de Hastings, appointed governor by Simon de Montfort, son of the deceased earl, he being absent in France, whither he had gone to solicit assistance to raise the siege. At length, the fortress surrendered to the king, and the Act of Concord passed by parliament, in 1267, was known by the name of the "Dictum de Kenilworth," this being one of the earliest acts of parliament as now constituted; or, at least, from the year 1266, 49th Henry III.

After the above surrender of the fortress, the king bestowed it on his fourth son Edmund, surnamed Crookback, Earl of Lancaster, and his heirs lawfully begotten; he likewise granted him free chase and free warren in all his demesne, lands, and woods belonging thereto, with a weekly market and an annual fair to the town of Kenilworth. The next prominent mention we find of the castle is its escheatment to the crown by the attainder of Thomas Earl of Lancaster, who was beheaded at Pontefract in 1322. The castle then became the prison-house of the unfortunate Edward II. after the prelates and barons in the camp of Queen Isabella had declared Prince Edward guardian of the kingdom. The king being discovered in his concealment at Neath Abbey, in Glamorganshire, was conducted in custody, first to the castle of Monmouth, and then to that of Kenilworth; he was next deposed by parliament; he remained some months longer at Kenilworth, and was then transferred successively to Corfe, Bristol, and Berkeley castles, and ignominiously put to death at the latter.

In the 13th of Edward III. Henry, brother and heir to Thomas Earl of Lancaster, executed in the preceding reign, had all his brother's estates restored to him, among which was the castle at Kenilworth. His son having only two daughters, on a partition, the castle fell to Blanche, the younger, who married John of Gaunt, Duke of Lancaster, by whom towards the latter end of the reign of Richard II. was built that part of the castle which remains to this day, the Norman fortress having

disappeared. Henry IV., son of John of Gaunt, united the castle, which he inherited, to the domains of the crown, of which it formed part till the time of Elizabeth. In the interval, Henry VIII. expended large sums in repairing and altering the castle; among other works, according to Leland, he removed the building erected by King Henry V. in a low marshy ground, denominated *Le Pleasans en Mary*, and set part of it up again in the base-court of the castle, near the Swan Tower. Elizabeth, by her letters patent, granted the property to her favourite Robert Dudley, afterwards the notorious Earl of Leicester, and his heirs. He rebuilt the greater part of the castle, and expended upon it vast sums of the wealth lavished upon him by his royal mistress.

There is a curious ground-plan of the castle as it existed at this period, which has been engraved in the last edition of Sir Walter Scott's delightful romance of "Kenilworth." Sir Walter had the original sketch lent him by Richard Badnall, Esq., of Olivobank, near Liverpool; it was found among the manuscripts of the celebrated J. J. Rousseau, when he left England; they were entrusted by the philosopher to the care of his friend, Mr. Davenport, and passed from his legatee into the possession of Mr. Badnall. This plan shows the castle to have been almost entirely surrounded by a lake, known as "the Pool;" the outer walls flanked by the Swan Tower and Lein's Tower on the north, where are the great gatehouse, and the garden, very extensive; on the east are the stables, orchard, and water-tower, flanking the base court, from which extends, in a diagonal or south-eastern direction, the long tilt-yard, with the gallery tower at one end, and Mortimer's tower at that opening into the base court. On the south is a strip of ground between the walls and the pool; the former embattled throughout. Towards the south-eastern angle is the sally-port; and on the east are the pool and walls, with an intervening strip of ground. The castle itself occupies nearly the centre of the demesne, and a drawing extant shows it to have had a profusion of windows in the principal front. As usual, the buildings surround a large inner court; the ancient portion, or Caesar's tower on the north, where also are three kitchens; and the Strong tower, arched three stories. On the west is the great hall, occupying the whole side, and on the south are the White hall, the presence-chamber, and the privy-chamber, with John of Gaunt, or Lancaster's buildings, at the south-east angle; while Sir Robert Dudley's lobby, and King Henry's lodgings, on the east, complete the plan. It will thus be seen that Leicester's building partakes more of the castellated mansion than the regular fortress to be traced in the older remains. This change in the construction of dwellings is characteristic of the times becoming more peaceful, and of law succeeding to the reign of the strong. Nevertheless, it must be recollected that the courtly Earl of Leicester, doubtless, built his princely castle for the purposes of state; upon it and the domains around he is said to have expended sixty thousand pounds sterling, a sum equal to half a million of our present money.

Sir Walter Scott, in revising his romance, had the good fortune to receive from his friend, William Hauser, Esq., an inventory of the furniture of Kenilworth in the days of the magnificent Earl of Leicester: he has adorned the text with some of the splendid articles mentioned in the inventory; but, for the gratification of antiquarian readers, he has appended portions of the document in the form of a note. It would occupy more room than can here be spared; but we subjoin a few of the most costly items. We should add, by the way, that the reprint is but a selection. It is of the date A.D. 1584. First, we have "a salte, ship-fashion, of the mother-of-perle, garnished with silver and divers workes, warlike ensignes, and ornaments. Pöls. xxij. oz.

"A gilt salte, like a swann, mother-of-perle. Pöls. xxx. oz. iij. quarters.

"A George on horseback, of wood painted and gilt, with a case for knives in the taylor of the horse, and a case for oyster-knives in the breast of the dragon.

"A green barge-cloth, embroidered with white lions and leaves.

"A perfuming pan of silver. Poids. xix. oz.

"In the hall. Tabells long and short, vj. Formes, long and short, xiiij."

The hangings are minutely specified, and consist of the following subjects, in tapestry, and gilt and red leather:—"Flowers, beasts, and pillars arched. Forest works. Historie. Storie of Susanna, the Prodigal Child, &c."

"The bedsteads, with their furniture" are magnificent and numerous. Among them we find "a bedsted of walnut-tree, toppe fashion, the pillars redd and varnished, the ceelor, testor, and single vallance of crimson sattin, framed with a broad border of bone-lace of golde and silver. The tester richly embrothered with my Lo. armes, in a garland of hoppers, roses, and pomegranettes, and lyned with buckerom.

"A crimson sattin counterpointe, quilted and embr. with a golde twist, and lyned with redd sarsenett," &c.

"A chaire of crymson sattin, suteable.

"A fayre quilte of crimson sattin, all lozenged over with silver twist, in the midst of a cinquefoil, within a garland of ragged staves, fringed round aboute with a small fringo of crymson silke lyned throughe with white fustian.

"Fyve plumes of cooleered feathers, garnished with bone-lace and spangells of goulde and silver, standing in cups, knitt all over with goulde, silver, and crymson silke."

The "cups" were, probably, on the centre and four corners of the bedstead: four bears and ragged staves occupied a similar position on another of these sumptuous pieces of furniture. There were in all, eleven down-beds, and ninety feather-beds, besides thirty-seven mattresses.

"The chaynes, stools, and cushens," were equally splendid with the beds. Among them is "a chaire of crimson velvet, the seate and backe partie embrothered, with R. L. in cloth of goulde, silver, and crimson silke; the frame covered with velvet, bounde about the edge with goulde lace, and studded with gilte nailles.

"A long cushion of crimson velvet, embr. with the ragged staffe in a wreath of goulde, with my Lo. posie, 'Droite et Loyall,' written in the same, and the letters R. L. in clothe of goulde," &c.

There were ten velvet carpets for tables and windows, forty-nine Turkey carpets for floors, and thirty-three cloth carpets, the former being "richly embr. with my Lo. posie, bears and ragged staves, &c. of clothe of goulde and silver," &c.

The pictures are chiefly described as having curtains: they are mostly portraits, including "The Queene's Majestie, (2 great tables.) 3 of my Lord." There are, also, "A tabell of an historie of men, women, and children, molden in wax," and "a little foulding table of ebonie, garnished with white bone, wherein are written verses with lres. of goulde."

The instruments include "organs, regalls, and virginals, covered with crimson velvet, and garnished with goulde lace."

Among the "Cabonettes" is one of "crimson sattin, richlie embr. with a device of hunting the stagg, in goulde, silver, and silke, with iiij. glasses in the top thereof, xvj. cupps of flowers made of goulde, silver, and silke, in a case of leather, lyned with greene sattin of bridges." Another of purple velvet; and a desk of red leather.

"A chess board of ebonie, with checkers of christall and other stones, layed with silver, garnished with bears and ragged staves, and cinquefoils of silver, the xxxij. men of christall and other stones sett, the one sort in silver white, the other gilte.

"A great brazen candlestick to hang in the rooffe of the house, verie fayer and curioullie wrought, with

xxiiij. branches, and sockets for candells, of brass, verie finely and artificiallylly done."

At Charlecote Hall, in Warwickshire, are preserved some curious chairs, and a cabinet of ivory and ebony, from a suite of furniture once used in Kenilworth Castle; and in the Tower of London is a splendid suit of steel armour, worn by the Earl of Leicester, and dight with the bear and ragged staff—his insignia.

"These specimens of Leicester's magnificence," adds Scott, "may serve to assure the reader that it scarce lay in the power of a modern author to exaggerate the lavish style of expense displayed in the princely pleasures of Kenilworth."

In 1575, Leicester gave here to Elizabeth a magnificent entertainment, which lasted seventeen days, of which a diverting tract has been written by Laueham, as great a coxcomb as ever blotted paper. These matchless festivities are stated to have cost Leicester a thousand pounds per day, a vast expenditure in those times.

The ruins are situated about midway between the line of railway from Coventry to Leamington, and at an easy distance to the right of the Kenilworth Station. The road lies across the village of Kenilworth, leaving the fine church, with its noble Norman work, upon the hill. Thence you proceed by a long shady lane, after passing a school-house, built at the expense of a Kenilworth "chirurgicon" of other days. As you advance, you enjoy a landscape of extreme beauty, in a succession of gentle undulations, the characteristic of Warwickshire scenery. At length, through the road-side trees, you catch a glimpse of the crumbling towers of the castle; and bearing to the left, you soon reach the gate-house, and will, in all probability, be importuned to buy or borrow a printed "Guide" to the ruins. As you enter, to the right, is the once trim garden, of which Scott speaks; and, to the left, the gate-house, in tenantable repair. It is worth while to knock at the door, and pay a trifle, to see a superb marble chimney-piece, richly sculptured, and dight with the initials of Elizabeth, and her favourite Leicester; and above, reaching to the lofty ceiling, is some fine carved work, in oak; these sumptuous remains having been removed here from one of the principal rooms of the castle. To the left of the gate-house, is the long range of stabling, now used as a barn. As you enter the base court, the castle ruins are indeed so many princely piles, even in their decay; the warm reddish stone, in contrast with the mantling ivy, has a very rich effect. The stately mass is, altogether, a most tangible ruin; for, with the plan in your mind's eye, you can trace the missing portions, just as you are sensible of the lost pieces of a child's incomplete puzzle. The massive keep, the roofless hall and towers, open to the blue vault of heaven, fully attest the magnificence of the castle-palace, and the interiors are still sufficiently perfect to enable you to trace the suites of state and private rooms, though the flooring, mantels, and ceilings, have long since been removed.

The ruins are the property of the Earl of Clarendon; his Lordship's agent has affixed to one of the walls a painted board, requesting that visitors do not deface or destroy any portion of the remains. This precaution may be necessary; for the public are admitted within the walls free of charge. Judging from the parties of visitors we saw here, the place is a favoured site for picnic parties, who take their repast on the velvet turf of the base-court, as they gaze, by turns, at the mouldering magnificence of an age of show, and splendour, and courtly revel.

THE LITTLE PRINTER.

CHAP. I.

"Br Guttenberg! that love of reading will be the ruin of you, Mr. Benjamin. Of what use is it to a printer to

read, or even to know how to read? Of what use is it, I ask you?"

He who thus spoke was an old working printer, who went on mechanically with his business, while the person he addressed, a young and delicate-looking apprentice, sat at a little distance, absorbed in a book.

"Of what use is it for a printer to read, do you ask me, Thomas?" replied the boy; "why, simply, that he may not print nonsense."

"And what is the nonsense to us? that is the author's business. It would be fine wearisome work, truly, to be obliged to read every thing we print!"

Benjamin smiled archly, and taking a bit of paper, he wrote a few lines unperceived by Thomas, then folding it as a note, he threw it on the desk, saying it was to be published in that day's paper. "Have you dated it?" he inquired.

"Boston, 17th January, 1721," said Thomas, looking for the date.

"My birth-day," said Benjamin; "I am fifteen years old to-day; but now, go on with your work, and let me finish my book."

"Is it the one lent you by Mr. Samuel, the rich merchant? I suppose it is very amusing."

"I think it is; the author is Daniel Defoe, who wrote the history of Robinson Crusoe, that I read to you when you were ill last winter. Do you remember it, Thomas?"

"And what do you call this book?"

"An Essay upon Projects—"

"Ah! I dare say this Essay upon Projects is the sequel to Robinson Crusoe; is it not, Mr. Benjamin?"

"Robinson is an entertaining book, Thomas; this is a more serious one, as you will understand directly, when I tell you that its object is the improvement of commerce, the employment of the poor, and the means of augmenting the public wealth; and it is this latter subject that I am anxious to study with particular attention."

"I know you will say that I am a fool, sir; but, by the immortal Guttenberg, I cannot see of what use it would be to you to augment the public wealth; in my opinion, it would be better to try and augment your own; especially as, to my knowledge, you are as poor as old Job."

"Go on with your work, and don't trouble yourself about that, Thomas."

"One word more, Mr. Benjamin; you, who are so learned, can no doubt tell me who is the man, or the conjuror, that puts in these little papers every day for your brother's journal."

"I cannot," said Benjamin, without raising his eyes from his book.

"Allow me to tell you that is impossible, Mr. Benjamin, for yesterday evening, at nine o'clock, there was nothing in the box; I went out, leaving you to watch, and when I returned five minutes afterwards, there was the paper. You do not like to tell me, Mr. Benjamin, the person has engaged you to keep the secret; but you ought not to keep it, as it will make me lose the dollar your brother promised to give me, if I discovered the author of those papers that all Boston are talking about. Have you read them, Mr. Benjamin? They must be very good, I suppose, since every one says so; but I will lay a wager they are not to be compared to the two beautiful songs that you wrote."

"Do hold your tongue, Thomas; they were nothing but blind men's ballads."

"Blind men's ballads! Mr. Benjamin; by the immortal Guttenberg, the inventor of printing!"

"Now that we are alone, Thomas, I must point out an error into which you and many others are continually falling; Guttenberg was not the inventor of printing."

"Oh! I see, Mr. Benjamin, you want to have a joke, but you cannot impose upon me," said the old man, shrugging his shoulders. "Guttenberg, the illustrious,

the immortal Guttenberg, was the true and only inventor of printing, and that is as well known as that the moon is the female of the sun!"

Benjamin smiled. "In the heavenly bodies there is neither male nor female, Thomas; but to return to your favourite hero, and to your hobby, printing—"

"My hobby! forsooth, Mr. Benjamin; it is my bread."

"I tell you then, Thomas, that printing was invented in 1430, at Haarlem, in Holland, by a man named Laurence Coster, but it was improved by Guttenberg, who established a printing-office at Mentz."

"What do you call improved, Mr. Benjamin?"

"This Laurence Coster, Thomas, made use of only wooden types, which, being threaded upon a string, were consequently moveable and uneven, and incapable of yielding a good impression. Guttenberg entered into partnership with a goldsmith, named Faust, and this man had an apprentice, called Peter Schaffer, who, in 1452, first invented the art of casting metal types. These three men joined, and from their press first issued the Latin Psalter, the Bible, and some other books, the titles of which you would not understand, Thomas."

"I know that I am only a fool, Mr. Benjamin; yet I cannot but think that those three celebrated and immortal persons must have been greatly respected in their time; no doubt they had many honours conferred upon them—were carried about in triumph—had marble statues erected to them—their names—"

"You are mistaken, Thomas; for Faust, who introduced this art into Paris, ran a great risk of being burnt alive: but there is no use in my telling you all this, it would only tire you."

"On the contrary, Mr. Benjamin, I have, as you know, but one employment and but one desire—to be for ever printing, printing, printing; and you, who read every thing, if you would tell me a little about printing, it would be very amusing."

"No, not amusing, but extremely interesting."

"Oh! pray begin, Mr. Benjamin, for I would much rather listen to you than be looking at you reading. I am all attention—go on, go on."

But at that moment both workman and apprentice were interrupted by the entrance of two persons.

"Oh!" said Thomas, "here comes the master, and he will be vexed that I have not been able to discover the mysterious writer."

"Apropos of writing, then, have you printed that note?"

"Yes, Mr. Benjamin."

"And without reading it?"

"To be sure, sir."

"Then you may as well go and be hanged, my poor old fellow."

CHAP. II.

"Brother," said Benjamin to the younger of the two persons who had entered the office, "will you have the goodness to read this paragraph, which Thomas has just printed in to-day's paper?"

"Indeed, Mr. Benjamin, you frighten me about that note; is it not well printed, very clear?"

"Oh! yes, it is clear enough, my poor friend."

Benjamin's brother took the paper, which was printed only on one side, and read aloud, yet not without showing evident astonishment at each word; "A most barbarous murder has been committed, which has thrown all the inhabitants of Boston into a state of the greatest excitement. Yesterday evening a man, named Thomas Simpleton, murdered his wife and his five children; this ruffian has been for the last three years employed in the printing-office of Mr. James Franklin."

"What, I! I murdered my wife and my five children!" exclaimed Thomas, turning pale, and dropping his arms down by his sides.

Both the announcement and the exclamation of

Thomas were received with a general burst of laughter, and Benjamin's unusual merriment soon discovered him to be the author.

"What is the meaning of this joke?" inquired his brother, as soon as he was able to compose himself.

"I wanted to prove to Thomas the utility of reading what he prints," replied the young apprentice.

"It was a joke then, Mr. Benjamin," said Thomas, losing a little of his terrified appearance.

"Yes, and a good one," said Benjamin, "to make a man accuse himself of being a murderer, without his knowing a word about it! But how pale you are, Thomas, are you frightened?"

"Marry! Mr. Benjamin, the devil is so malicious."

"He cannot, however, make you a murderer against your will."

"But, Benjamin," said the older of the two persons, who during this scene had been attentively observing the young apprentice, "I do not see why you should be endeavouring to promote a taste for reading in your brother's office; if all the workmen were to spend their time in reading like you, what would become of the establishment?"

"The health of my workmen would also suffer by it," replied the master of the office; "for I only yesterday discovered that Benjamin is actually starving himself."

"How can that be?" exclaimed the father, "for in the arrangement that I made with you, James, it was agreed that for the nine years your brother was to serve his apprenticeship to you, that you were not to give him any payment, but were to support him."

"Well, father, about six months ago, Benjamin came to me, and said that I paid too much for his support, and that if it would be equally agreeable to me, he would rather I gave him half the sum, and let him provide for himself. I could only suppose that he did not like the kind of food provided for him, and that he preferred choosing for himself; I therefore consented, and what has been the consequence? that Benjamin scarcely eats anything, and saves all his money to buy books."

"You are mistaken, brother, I eat plenty, only I live economically. Among the books lent me by my cousin, there was one which recommended vegetable diet as the best means of keeping the body healthy, and the mind active. I studied this way of living, and the author's method of dressing potatoes and rice in the most economical manner, and it was not until I was in full possession of these discoveries that I made the proposal of supplying myself. I have dined very well, I assure you, father, on bread and raisins, and a glass of water."

"And, thanks to your Pythagorean system, you are becoming as pale and transparent as the water you drink."

"Besides, I have given up a vegetable diet," added Benjamin.

"Since when?" inquired his brother.

"Since the day before yesterday, when, on going into the kitchen, I saw Susan cleaning some fish, and in the inside of a large cod she found a small fish; 'Oh! oh! my lad,' said I, 'since you can eat one another, I see no reason why we should not eat you; and that proves,' added he, laughing, 'that man is rightly called a reasonable creature, since he can so easily find reasons for justifying whatever he wishes to do.'"

"What a fickle, unsteady mind!" said his father; "in place of going on regularly with one business, Benjamin, you are always thinking of something else than of what you ought to do."

"How can I help it, father?" replied the boy, "I had but one desire, that of studying,—but one vocation, that of printing,—but one ambition, that of being a clergyman. Oh! how I should like to be the chaplain of the family. You know, father, how happy I was when at school."

"Unfortunately that education was too expensive for my means; but in place of becoming the chaplain of the

family, as you call it, would it not be quite an honourable to become the support of it? and for that, you have only to continue my business."

"To melt tallow, prepare moulds, and manufacture candles! that is a business, father, that a person can acquire when he likes, and without being confined to deep and scientific studies."

"You are wrong there, Ben," said his father, "all manufacturers do not make equally good candles; but that is not the subject in question. You had scarcely begun one business, when a book of voyages fell into your hands, and immediately you would think of nothing but sailing about, steering a boat, and making voyages."

"And swimming too, father; I taught myself to swim, which is no such easy matter."

Mr. Franklin resumed: "To divert you from that fancy, and with a wish to settle you more suitably, I tried to have you taught the cutlery business—"

"And unfortunately," interrupted the apprentice, "a lodger at the cutler's with whom you placed me possessed a fine library; Voyages and Travels, Histories of France and of England; it would have been a clever person, I promise you, that could have brought me from the library to the workshop; oh! what a pleasant time I spent at the cutler's!"

"At last, in order to satisfy your insatiable passion for books, I decided on making you a printer, although there was already one in the family; I placed you with your brother, and here again you will do nothing except turn over books and read."

"And make verses," said Benjamin proudly, "ask my brother the success of my last song."

"It was immense," said James.

"My children, I have read those verses," resumed the father; "and I must confess that it grieves me to destroy the delightful illusions which this success has raised in the mind of Benjamin, but it is my duty both as a father and a friend to tell him the truth; those verses are detestable and worthless, void of taste, metre, or elegance; they have wit, I allow, but what is wit without good sense! A bad poet,—which Benjamin is to the last degree,—a bad poet, I say, is the most useless being in the world, while at the same time he is the most ridiculous: poetry does not admit of mediocrity. If, indeed, you wrote verses as the mysterious writer of that article upon political and domestic economy writes prose, that is what I would call writing, that is sense; the style is rather youthful, there are some erroneous ideas, but what soundness of mind, what judgment! Those writings are the indications of a superior genius, and the author will one day be a great man! Have you read those articles, Benjamin?"

"I have," he replied, with affected indifference.

"Have you no clue yet as to who is the author of those papers?" inquired Mr. Franklin of his eldest son, who was correcting the proof of his journal.

"None whatever," he replied; "I have charged Thomas to watch for the person who puts them into the box."

"And I have watched, sir," said Thomas, "I watched for two long hours, till some one called me out of the office; I then charged Mr. Benjamin to watch, but apprentices are no good; while Mr. Benjamin was there the article was put into the box, and yet he saw nothing."

"That is impossible, Benjamin," said his father.

Benjamin coloured, while he replied, "Do you think, father, that I could sit with my eyes constantly fixed upon the aperture of the box?"

"That is an evasion you are making," said his father.

"I have the most urgent desire to know the author of those anonymous papers; they not only have given great repute to my journal, but I wish to have an interview with this individual, and to concert with him the means of sometimes giving a new direction to its ideas.—Now, Benjamin, acknowledge that you

have seen this person, and that you have been enjoined secrecy."

"Come, Mr. Benjamin, acknowledge it," said Thomas, "consider that I shall gain a dollar by your confession."

"A constable's letter, sir," said a workman, entering the office, and handing a sealed letter to James.

James eagerly opened the letter and read as follows:—

"Mr. James Franklin,—I have taken the best means to discover the author of the anonymous articles which appeared in some of the last numbers of your journal, and I have obtained the most undoubted proofs that the writer is in your house, and in your own employment.

"Have the goodness, sir, to make the most minute inquiries into this business. I expect to be informed of the result before four-and-twenty hours.

"NELSON BURDET, Constable."

"What can be the meaning of this? What is to be done?" exclaimed James, when he had finished the letter; then raising his head he was astonished at the number of people who had assembled around him.

CHAP. III.

As James Franklin had continually, like most of the inhabitants of New England, a number of people at his house, it was not so much the number of his visitors that surprised him, as the bewildered expression of their countenances.

"It is extraordinary," said one; "besides, the last article possessed a boldness——"

"Of what importance can the opinion of a single individual be to the government?" said another.

"But it appears that the constable attaches considerable importance to it," added a third.

"A man who censures every one, who advises every one, who attacks every opinion," said a fourth.

"It is extraordinary," said they all.

"But the most singular part of it is, gentlemen," said James, "that the culprit is in my house, and that I do not know him."

"By Guttenberg, sir," said Thomas, touching his cap, "if you will permit me to give my opinion, you can yourself put your hand upon the author."

"Hold your tongue, Thomas," whispered Benjamin.

"Let me speak, Mr. Benjamin; though I am only a fool, yet I know that the writer will not be very difficult to find."

"Say who! say who!" exclaimed several voices at once.

"Marry, gentlemen, I dare not; but the master could name him if he liked."

"What an absurd supposition!" said James, shrugging his shoulders.

"If you have to run any risk on account of that, my dear master," replied Thomas, "you must even be silent, but as sure as Guttenberg was not the inventor, but the improver of printing, as Mr. Benjamin has just informed me, I make a guess, that he who wrote the anonymous articles knows how to write: the constable asserts that the person is in this house; then, as there is no person here who knows how to write, except you and Mr. Benjamin, and as he is too young for that, and besides, cares for nothing but reading, then——you perceive——"

"James," said his father, "this dissimulation with me is wrong."

"And with us all, James," exclaimed several voices, "what! it was you who wrote those articles and concealed it from us!"

Thomas now advanced boldly into the midst of the assembly, and holding out his hand to his master, he said, "I have won my dollar, sir; it was I who first guessed that it was you."

"You are a blockhead," said his master, angrily.

"That is nothing new; I know it this long time, but that does not prevent me having won my dollar."

"Good morning, Mr. Franklin, good morning, James,"

said a new visitor, on entering the the office, "your servant, gentlemen. Well! you have heard the news!"

"What news, Mr. Samuel?" exclaimed James, and several others.

"Why, that the author of the anonymous articles in your paper has been arrested."

Benjamin trembled and turned pale.

"That is to say," continued the new comer, "that if he be not already arrested, he will be so before long."

"He is known then," observed Mr. Franklin, the elder. "In the meantime, my poor James, you had better keep out of the way, for if it be not true, I know that people can come upon the printer; therefore, take care of yourself!"

"Arrest! do you think they could arrest my brother, Mr. Samuel?" exclaimed Benjamin, in breathless haste.

"Only in case they cannot discover the author of the articles, my young friend."

"Ah! my dear master, how sorry I am that I informed against you," said Thomas, quite vexed with himself. "By Guttenberg, the famous inventor—no, the improver of printing,—that is what comes of having a bad head.—Oh dear, oh dear!"

"The constable, sir," said a workman.

At the same moment an elderly man entered the office, towards whom every eye turned with anxiety.

As soon as the constable entered, Benjamin ran to him. "Sir," said he, "if any one here is to be arrested, I am the person." And as every one was struck dumb with surprise, the generous boy continued:—"I accuse myself of being the author of the anonymous articles which appeared in several of my brother's papers; I can prove it by the copies of those articles which are still in the drawer of my table. I beg, sir, that no person may suffer on my account, and, above all, do not punish my brother for having printed them; for pity's sake, let me be the only sufferer!"

"And who talks of punishment and suffering?" asked the magistrate, taking the young apprentice by the hand, and regarding him attentively.

"Are you not looking for the author of those articles?" inquired Benjamin.

"Yes, certainly, my boy; not to punish, but to reward him; to testify our satisfaction at his inimitable writings, so full of mind, sense, and judgment. What! is it you, who appear such a child, yet write like a man?—but how old are you, sir?" continued the magistrate, no longer calling him "my boy," so much had he already increased in his estimation.

Benjamin looked down in confusion, and modestly replied, "Fifteen years old, sir."

"And whence can you have drawn, at your age, such an extensive knowledge of trade and political economy?"

"Here, sir," said Benjamin, pointing to those around him; "I heard these gentlemen speak, and then I wrote."

Sobs were heard, which interrupted this interrogatory; and Benjamin, turning round, saw his father, with a handkerchief to his face.

"You are weeping, father," said he, rushing towards him.

"It is for joy," replied the old man, opening his arms to his son, and clasping him to his breast; "it is for joy, for happiness! And as I said before, give up poetry, so now I say, pursue your career, young man: the boy who listens attentively to the conversation of men, and who has sense to discern between right and wrong, in order to form his own judgment,—that boy will do well, and his father will be the happiest of parents."

"By Guttenberg! Who will pay me my dollar?" exclaimed a voice from behind them.

"I will, as soon as I possess one," said Benjamin.

"In the meantime, take this one, Thomas," said Mr. Franklin, putting a five-franc piece into the hand of the old printer.

This little scene, my young reader, was but the prelude to what Benjamin Franklin afterwards became.

I will now briefly relate the remainder of his life, and show how he went on from invention to invention, each more useful than the other, until he made that finest of modern discoveries, the lightning conductor.

A misunderstanding having occurred between the two brothers, Benjamin departed from Boston, by sea, for New York, but not being able to procure employment there, he proceeded to Philadelphia; there he had not a single acquaintance, and all the money he was worth was one dollar.

Franklin found but two printers in that city, one of them, named Keyman, employed him through charity, but he soon found him his cleverest compositor. Sir William Keith, governor of the province, took much notice of him, and urged him to set up for himself, promising him every assistance. He then proposed to him to make a voyage to England, in order to procure all the necessary materials for a printing-office, and promised to take upon himself all the expenses attendant upon it. Franklin gladly embraced the proposal, and set sail about the beginning of 1725. Upon his arrival in London he found that Governor Keith had completely deceived him, and had forwarded neither letters of credit, nor of recommendation, and he was consequently unable to return to Philadelphia. He then, for a present support, engaged himself as a workman in the house of Palmer, a printer of note in Bartholomew-close.

At this time, although but seventeen years of age, his mind was turned towards plans of general utility. Having taught himself to swim at Boston, and knowing the difficulties of that art, he was anxious to establish a swimming school in London; but the desire of seeing his native country prevailed over every other consideration, and he returned to Philadelphia, where he entered into partnership with a person of the name of Merideth, whose father was able to advance the necessary money; the understanding being that Franklin's skill should be placed against the capital to be supplied by Merideth. In process of time Merideth withdrew from the partnership, and Franklin became possessed of the whole concern, to which he soon afterwards added the business of a stationer.

His public life now commenced, and even his relaxations became works of utility: he instituted a club for the purpose of discussing political and philosophical questions, each member of which was obliged, once a month, to read out an essay of his own composition. The purchase of an indifferent paper, founded by Reiser, the printer, which he soon enlivened with articles teeming with wit and sound sense, increased both his reputation and his resources. In September 1731, he married Miss Read, and his prosperity from that time rapidly advanced.

Feeling how useful books had been to himself, as it was to them alone he was indebted for his education, he established a public library in Philadelphia, in 1731, (the first one ever known in America,) which, although it commenced with only fifty subscribers, became in course of time a large and valuable collection, the proprietors of which were eventually incorporated by royal charter; but while yet in its infancy, it afforded its founder facilities of improvement of which he did not fail to take advantage, setting apart an hour or two every day for study, which was the only amusement he allowed himself. In 1732 he commenced publishing his celebrated almanac, commonly known by the name of *Poor Richard's Almanac*, in which a number of prudential maxims were inserted, distinguished by a proverbial point and conciseness, calculated to fix them indelibly upon the memory: they have been collected into a single short piece, entitled "*The Way to Wealth*," which has been published in a variety of forms. In 1733, he began to teach himself the French, Italian, and Spanish languages, and revived his recollection of the Latin, which he had nearly forgotten. In 1735 he was appointed clerk to the General Assembly of Pennsylvania; the following year he obtained the lucrative

office of postmaster to the city of Philadelphia. In 1738 he improved the police of that city with respect to the dreadful calamity of fire by forming a society called the Fire Company, to which was afterwards added an insurance company against losses by fire. Soon after this he commenced those electrical experiments which have conferred so much celebrity on his name.

The Library Society of Philadelphia had received from England an account of the curious facts relative to electricity which then engaged the attention of the European philosophers, together with a tube for experiments, and directions for its use. The Society deputed Franklin to repeat those experiments, and he not only repeated them, but made several new discoveries; he was the first to observe the power of pointed bodies, both in drawing and in throwing off electric fire; and immediately, as his genius led him to applications, he conceived the idea of bringing down electricity from the clouds; for he had observed that thunder and lightning were only the effect of the electricity of the clouds. A simple toy enabled him to resolve this bold problem: he made a kite, which he covered with silk instead of paper, as being less likely to be injured by the rain; to the upper end of the kite he affixed an iron point, and having appended a key to the end of its hempen string, he drew down, from a passing thunder-cloud, electric fire, enough to yield sensible sparks from the key. He immediately perceived the utility of this discovery, as affording a means of preserving buildings from the effects of lightning, which are particularly alarming on the continent of North America. By means of pointed metallic conductors projecting from the top of the building, he conceived that the passing thunder-clouds might be made to discharge their fire silently and innoxiously; and such was the confidence in his opinion, that these conductors soon came to be generally used in America, and afterwards throughout Europe.

We have seen that he was a useful and a learned man, we will now view him as generous and philanthropic.

In 1763, the schools were poor, ill directed, and badly attended; Franklin proposed a plan of public instruction, and in order to establish it, he opened a subscription list, which was soon filled: and it was thus he founded the College of Philadelphia. He was also greatly instrumental towards the foundation of the Philadelphia Hospital. But all his enterprises of public utility never diverted his attention from his private duties; he had acquitted himself so well in his office of post-master, that the government raised him to the important employment of deputy post-master general for the British Colonies, and the revenue soon felt the benefit of his attentions.

At a later period, after the Revolution of Boston, when the American war broke out, Franklin openly declared himself, in Congress, as favourable to liberty; he took an active part in the memorable Declaration of the 4th July, and proclaimed the national independence of the thirteen United States.

He was then elected president of the Convention at Philadelphia, assembled to settle a new form of government for the then State of Pennsylvania, and the result of the deliberations of that assembly may be considered as a digest of Dr. Franklin's principles of government.

When, in 1776, it was deemed advisable by Congress to open a negotiation with France, Franklin, though then in his 71st year, was considered, from his talents as a statesman, and reputation as a philosopher, the most suitable person to effect the desired end; and he was consequently nominated commissioner-plenipotentiary to the court of France. His residence in that country did not prevent him from amusing himself with mechanical arts and sciences. Grateful for the kindness of Marie Antoinette, he made for her the first harmonicon which had ever been heard in France. This precious instrument, given by the queen to Madame de Vence, is still in Paris, and has a place in the cabinet of

Professor Lebreton, who religiously preserves this historical memorial.

At the age of seventy-nine, his increasing infirmities made him desirous of returning to his native country; he was conveyed to Havre, on a litter, borne by Spanish mules, kindly placed at his disposal by the Queen of France, as the most easy mode for him to travel. On the road he experienced every mark of respect from several of the nobility and gentry whose châteaux lay adjoining, and particularly from the Cardinal de la Rochefoucault at Gaillon, where he passed a night, with his accompanying friends and attendants. He reached Havre safely without having experienced much inconvenience from the journey, and embarked in a small packet for Southampton, whence, after remaining a few days, he sailed for Philadelphia, where he landed safely on the 14th September, 1785.

The arrival of this great man was looked upon as a national triumph; he was borne to his house amid the acclamations and benedictions of the people, the ringing of bells and the firing of cannon. He received congratulatory visits and addresses from all the public bodies, every one being desirous to do him honour. He employed his latter years in exhorting his fellow-citizens to union: his last work was upon the abolition of slavery.

He expired on the 17th April, 1790, at the age of eighty-four.

So great and universal was the regret for the loss of this great man, that a general mourning was put on throughout the United States; and in France, at the suggestion of Mirabeau, supported by M. de la Rochefoucault, Liancourt, and Lafayette, the National Assembly ordered a public mourning of three days for Franklin.

COUNTRY SKETCHES.—No. VI.

THE RUINS OF CAISTER CASTLE.

THE advantage which a country long since civilized possesses over one whose plains and pastures are but half redeemed from their primeval state, is in nothing more manifest than in the constant recurrence of remains of the habitations, temples, monuments, and memorials of successive generations of men; for these may be truly called the landmarks of time. In them and by them the historian and antiquarian are enabled to trace the progress of human thought and action; to see, as in a mirror, much that would be otherwise lost in the gloom and darkness of ages. Who shall say, too, that the moralist, the philosopher, and the practical man, does not glean from their inspection many valuable ideas of the past, many of the motives and aims of former actions, and many of the true causes and effects of human impulses? It is needless to remark that the artist and poet find in them a world of beauties, which seem exclusively to belong to bygone days; and which assist the imagination, and stimulate the fancy, when present life could afford no aid so powerful or interesting. In a new land, or in a country but slightly populated, there are none of these picturesque adjuncts to its natural beauties. In this respect, therefore, it suffers by comparison with older climes. Yet, in the aspect of ruins there is something mournful and saddening; reflections on the incidents that may have passed in old halls, where ivy now crowns the summit of every tower, and where the owl is sole tenant and master, will tend, for the time, to damp the spirits. The first sight of a castellated mansion, or crumbling monastery, ruinous and time-worn, produces a thrill of pleasure; but as the eye becomes accustomed to the view, and some solemn echo arouses the startled wanderer to contemplation of past grandeur, the same train of thought leads the mind insensibly, as it were, to the end of all things, to the grave, and to that day when—

"The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself;
Yea, all which it inherit, shall dissolve;
And, like this insubstantial pageant faded,
Leave not a rack behind."

On the present occasion it is not, however, fitting to indulge in gloomy reveries, though the excursion is devoted to visiting a ruin, one of those relics of feudal times which are so replete with interest.

After quitting the town of Yarmouth, with its noble quay, the road northward soon leaves the sea and the long flat coast on the right hand, and after stretching across the marshes, where innumerable flocks of geese are feeding, arrives at Caister, a small village not particularly inviting in its aspect. Passing the church, with its flint-built tower and decorated porch, the corn, with its golden promise, is seen on either hand, and presents, with the green livery of the hedgerows and the scarlet brilliancy of the straggling poppies, such a happy combination of colour as cannot fail to impart cheerful and gentle thoughts. There are but few trees scattered here and there by the way-side. Proximity to the ocean seems ever fatal to the growth of forest trees; and in such situations they are seen bending their dwarfed limbs to the side farthest from their enemy. But we have come to a lane where several small oaks form by their leafy contiguity a pleasant avenue, and we will not pause longer to note these peculiarities of nature. This lane skirts the brink of a dell where gipsy tents are often seen, and soon approaches a farm-yard, where the long and narrow haystacks and the carefully-tended dove-cotes, bespeak praises for the farming of Norfolk. Before reaching this secluded spot, the eye, roving in this direction, will have observed a tower, rising from amidst the surrounding trees. To reach it we must pass through the exterior part of the farm-yard.

This tower, which is a remnant of Caister Castle, is very interesting, and it is greatly to be regretted that so small a portion only has survived the wear and tear of centuries. All that now remains is this circular tower, which is of great height, and a range of walls on the north and west sides. On one of these walls there is a projecting corbel table, but the corbels and what is left of the arch are both in a very dilapidated state. The tower itself has some extensive cracks near its base, and is also fast yielding to the stern hand of Time. The structure is of brick, with stone facings, the tracery of the windows and loop-holes being of the latter material. There is a fine arch yet standing, which was in all probability the entrance to the great hall. The castle must have been a place of much strength, and of large dimensions also, inasmuch as we are told by William of Worcester that the dining-room was fifty-nine feet long, and twenty-eight feet broad.

Not many years ago the arms of the founder were to be seen over a bay window in the interior of the ruins. They were taken down and removed to Blickling, where they now serve as a principal ornament of that noble mansion. The moat, in part, remains, and increases the artistic effect of the castle.

Its history is not without interest. It was built by Sir John Fastolf, in the early part of the fifteenth century. This gentleman was a Knight Companion of the most noble order of the Garter, and descended from a very ancient Norfolk family: he was first engaged in the service of the then Duke of Clarence, Lord Lieutenant of Ireland, in which country he was married to the Lady Millicent, daughter of one Sir Thomas Tibbot, Lord deputy of Ireland, and relict of Sir Stephen Scrope. After this we find him engaged in various military capacities under John Plantagenet, Duke of Bedford, during which period he became Marshal of the Regent's Household, Governor of Anjou and Maine, Captain of the city of Mans, of Alençon, and many other places; rewards, doubtless, of his prowess in the field. His campaigns extended over a period of forty years, and he

had for secretary the famous William of Worcester, to whom all subsequent chroniclers are so much indebted for his most valuable and accurate information. So far as has now been related, all is indisputable fact; yet, in the teeth of this evidence, we find Granger asserting that he retreated with disgrace at the battle of Putoy, and that the order of the Garter was taken from him as a punishment for his pusillanimity.

In the First Part of Henry the Sixth the same idea is carried out, and Fastolfe is spoken of by a messenger to the Dukes of Bedford, Gloster, and the Bishop of Winchester, in these words:

"Here had the conquest fully been seal'd up
If Sir John Fastolfe had not play'd the coward;
He being in the wayward, (plac'd behind,
With purpose to relieve and follow them,)
Cowardly fled, not having struck one stroke."

In the fourth act he is stripped of his order, and ordered off by the king in this wise:—

"Stain to thy countrymen! thou hear'st thy doom,
Be packing therefore, thou that wast a knight;
Henceforth we banish thee, on pain of death."

Holinshed and Hall are said to have been the probable authorities for this imputation on the knight's fame by Shakspeare.

That neither of them were chroniclers to be wholly and fully relied upon, is certain, as there are no collateral evidences to bear out the assertion of his cowardice. On the contrary, we hear of his return home, of his having finished this very castle with the ransom-money he received from John II., King of France, whom he captured at Vernuil in 1424; also of his second marriage with Margaret Howard, and of his being the founder of several religious and charitable edifices; the patron of worthy, valiant, and enlightened men. That William of Worcester should have been attached to the service of this gentleman is surely some testimony to his character. Whoever was the originator of the belief in Fastolfe's cowardice, it must not be laid to the charge of the immortal author of the play, for at the time it was written Holinshed was deemed a great authority.

There has existed in the minds of many able writers a great doubt as to whether the Bard of Avon was the veritable author of the three parts of Henry the Sixth. Hallam, the great historian, and Collier, a man whose respect for Shakspeare knows no bounds, both incline to this opinion. There are many very strong grounds for the belief that they were written by some dramatist of the preceding era, and altered or adapted for representation by Shakspeare. No one was so careful as he in the selection of his facts, and he would never have so degraded Fastolfe without some good authority for so doing. Now all veracious chroniclers concur in their account of his valour.

It has been said and believed that that inimitable creation, Falstaff, which most certainly is all Shakspeare's own, was taken from this same Sir John Fastolfe. But this, for many reasons, we beg leave to doubt. The Paston Letters contain nothing but what is to the credit and praise of Fastolfe; nothing to connect him in any one respect with Sir John, the fat knight, whose feats and acts have raised many a laugh, both in the solitude of the study and in the crowded theatre.

Sir John Fastolfe occupies a very small share of our attention in the First Part of Henry the Sixth, whereas, in the Merry Wives of Windsor, and the First and Second Parts of Henry the Fourth, Sir John Falstaff is the chief actor, and monopolizes the most prominent situations. There is yet standing in the city of Norwich, in the district called Tombland, a rambling irregular house, which was owned by Fastolfe, and most likely used by him as a town residence. Two extraordinary carved figures of wood, called respectively Samson and Hercules, mount guard in the paved court, and forcibly recall old times.

It is time to turn to the ruinous castle, however, and leave these inquiries as to the identity of the real Fastolfe and fictitious Falstaffs for abler commentators to establish or disprove.

Fortunately, the moat is perfect round the tower and west wall, and the shadows cast on the water on the one side by the ruins, mix with the umbrageous reflections of some old ash-trees on the opposite bank. There is no ivy on any part of the castle, but a pear-tree, carefully trained on the corner of the tower, adds the pleasant effect of the scene. It is the subject, above all others, constantly chosen for the pencil of all wandering artists, who are frequently at a loss to know which side to take; and where any choice must be a happy one, it becomes almost an impossibility to advise. To muse upon the spot, and recall the memorable age in which these vestiges were a fair specimen of a goodly baron's home, is to read a lesson upon the progress and advancement of our enlightened age. Every thing has its uses.

"And this our life exempt from public haunt
Finds tongues in trees, books in the running streams,
Sermons in stones, and good in everything."

The ploughshare and the reaping-hook have taken the place of sword and shield. The mailed warrior sleeps in the rest that knows no waking; and the echoes of the old walls ring no more with the shouts and din of the retainers, eager alike for the banquet or the fray. A new cycle in the world's history has supervened, and a different race of thinking and acting men move in the busy paths of life.

This castle owes its present condition to the circumstance of its having been besieged twice in the reign of Edward IV.; and to a lamentable fire, occasioned by the careless negligence of a servant girl, which completed the destruction man's wilful violence began. There is a neat dwelling close at hand, which in its trim and orderly aspect, forms a cheerful contrast to the decayed habitation of such far higher pretensions. Cows returning from pasture to be stalled and housed for the night, and a large stock of poultry of every description seeking their roosting places, are very suggestive objects of gentle English living.

Not out of place, but ever in keeping with the time and situation, is the voice of some wandering heron, flying over marshy brake to its nest; and the owl's peculiar cry comes upon the ear to remind the visitor of its association with ruined tower and tree. So there is music even in the ruined halls of Caister Castle, though dulcimer and lute are silent; nature, through her winged children, speaks in song, and completes all that is wanting to heighten the beauty, mournful though it be, of this retired solitude.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE LOST HOPE.

T. N. H.

AN Angel rose upon the wings of Night,
And Darkness it was Light;
The pale-eyed star-watch, trembling, shrink away,
As though at dawn of day.

The billows rag'd, the whirlwinds blew,
And the tempest wilder grew;
A vesper-bell chimed down the vale,
And hushes the uprising gale—

A note so soft and still, it wooed the air,
And bids the storm-fleets back to their deep-fathom'd lair.

The vision passes on in icy scorn,
And seeks the blushing morn;
For bell of prayer, a funeral toll
Greets mournfully a parting soul;
The winds howl fearfully,
The despairing pleads tearfully,
But the hoarse rocks mock at his lonely moan,
The wild waters stifle his last death-groan—
The waves flow'd calm as before,
And a body lay cold on the shore.

THE GRAVE.

BY GRACE.

THE grave is deep and stilly,
Fear round its brink abides;
With veil all dark and chilly,
An unknown land it hides.

Its silence is unbroken
By the sweet night-bird's song;
Affection's flowery token
Fades on the moss ere long.

There widowed brides may languish,
And wring their hands in vain;
The orphan's cries of anguish
Pierce not that dark domain.

Yet, there alone can mortals
Their rest, long wished-for, find;
There lies beyond those portals,
A home for all mankind.

The heart, long vainly pressing,
Through storms to reach the shore,
Finds peace, that priceless blessing,
Where it can beat no more.

VILLAGE LYRICS.

No. IV.—AN ANGLER'S SONG.

W. BRAILSFORD.

THE light hath shot athwart the stream
Three mortal hours ago,
And I have left my morning dream
To wander down below;
Where trout and perch so deftly glide
In the shadows of the trees,
And blossoms from the orchard side
Are floating round the bees.
The world may scoff,—Yet what care I?
Let it laugh,—and still
I'll tune my merry melody
To the click-clack of the mill.

With rod and line I am a king,
My subjects all obey;
The bullfinch plumes his dainty wing,
And sings for me to-day.
The heron, from the reedy lake,
Hath paused to note my path,
The bittern, in the sedgy brake,
Hath stayed his screaming wrath,
The world may scoff,—Yet what care I?
Let it laugh,—and still
I'll tune my merry melody
To the click-clack of the mill.

The birds are singing madrigals
Adown each bosky dell,
And sweetly o'er the waterfalls
"The native wood-notes" swell.
My footsteps, sure, the bee doth know,
By the bruised and shrinking thyme;
He hovers o'er the way I go,
'Neath the blossom o' the lime.
The world may scoff,—Yet what care I?
Let it laugh,—and still
I'll tune my merry melody
To the click-clack of the mill.

The very winds their tributes bear
The river's course along,
Whose perfume fills the gentle air,
Half burden'd with sweet song.
And so I pass a pleasant time,
Unmindful of the strife
That mingles with the city's chime,
And speaks of human life.
The world may scoff,—Yet what care I?
Let it laugh,—and still
I'll tune my merry melody
To the click-clack of the mill.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

TIME is like a ship which never anchors: while I am on board, I had better do those things that may profit me at my landing, than practise such as shall cause my commitment when I come ashore. Whatsoever I do, I would think what will become of it when it is done. If good, I will go on to finish it; if bad, I will either leave off where I am, or not undertake it at all. Vice, like an unthrift, sells away the inheritance, while it is but in reversion: but virtue, husbanding all things well, is a purchaser.—*Fellham*.

THOSE who place their affections at first on trifles for amusement, will find these trifles become at last their most serious concerns.—*Goldsmith*.

THE passions, like heavy bodies down steep hills, once in motion, move themselves, and know no ground but the bottom.—*Fuller*.

THESE latter ages of the world have declined into a softness above the effeminacy of Asian princes, and have contracted customs which those innocent and healthful days of our ancestors knew not, whose piety was natural, whose charity was operative, whose policy was just and valiant, and whose economy was sincere and proportionable to the disposition and requisites of nature.—*Jeremy Taylor*.

TASTE and elegance, though they are reckoned only among the smaller and secondary morals, yet are of no mean importance in the regulation of life. A moral taste is not of force to turn vice into virtue; but it recommends virtue, with something like the blandishments of pleasure.—*Burke*.

HE whose heart is not excited upon the spot which a martyr has sanctified by his sufferings, or at the grave of one who has largely benefited mankind, must be more inferior to the multitude in his moral, than he can possibly be raised above them in his intellectual nature.—*Southey*.

TRUST him little who praises all, him less who censures all, and him least who is indifferent about all.—*Lavater*.

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. XV.

A CHARADE—NOT ALL ACTING.

LAWLESS's penitence, when he learned the danger in which Fanny had been placed by his thoughtlessness and impetuosity, was so deep and sincere, that it was impossible to be angry with him; and even Oaklands, who at first declared he considered his conduct unpardonable, was obliged to confess that, when a man had owned his fault frankly, and told you he was really sorry for it, nothing remained but to forgive and forget it. And so every thing fell into its old train once more, and the next few days passed smoothly and uneventfully. I had again received a note from Clara, in answer to one I had written to her. Its tenour was much the same as that of the last she had sent me. Cumberland was still absent, and Mr. Vernon so constantly occupied that she saw very little of him. She begged me not to attempt to visit her at present: a request in the advisability of which reason so fully acquiesced, that although feeling rebelled against it with the greatest obstinacy, I yet felt bound to yield. Harry's strength seemed now so thoroughly re-established, that Sir John, who was never so happy as when he could exercise hospitality, had invited a party of friends for the ensuing week, several of whom were to stay at the Hall for a few days,—amongst others, Freddy Coleman, who was to arrive beforehand, and assist in the preparations; for charades were to be enacted, and he was reported skilful in the arrangement of these saturnalia of civilized society, or, as he himself expressed it, he was "up to all the dodges connected with the minor domestic enigmatical melodrama." By Harry's recommendation I despatched a letter to Mr. Frampton, claiming his promise of visiting me at Heathfield Cottage, urging as a reason for his now doing so, that he would meet four of his old Helmsstone acquaintance, viz. Oaklands, Lawless, Coleman, and myself. The morning after Coleman's arrival, the whole party formed themselves into a committee of taste, to decide on the most appropriate words for the charades, select dresses, and, in short, make all necessary arrangements for realizing a few of the very strong and original, but somewhat vague ideas, which everybody appeared to have conceived on the subject.

"Now, ladies and gentlemen," began Freddy, who had been unanimously elected chairman, stage-manager, and commander-in-chief of the whole affair, "in the first place, who is willing to take a part? Let all those who wish for an engagement at the Theatre Royal, Heathfield, hold up their hands."

Lawless, Coleman, and I, were the first who made the required signal, and next the little white palms of Fanny and Lucy Markham (whom Mrs. Coleman had made over to my mother's custody for a few days) were added to the number.

"Harry, you'll act, will you not?" asked I.

"Not if you can contrive to do without me," was the

reply. "I did it once, and never was so tired in my life before. I suppose you mean to have speaking charades; and there is something in the feeling that one has so many words to recollect, which obliges one to keep the memory always on the stretch, and the attention up to concert pitch, in a way that is far too fatiguing to be agreeable."

"Well, as you please, most indolent of men; pray, make yourself quite at home, this is Liberty Hall, isn't it, Lawless?" returned Coleman, with a glance at the person named, who, seated on the table, with his legs twisted round the back of a chair, was sacrificing etiquette to comfort with the most delightful unconsciousness.

"Eh? yes to be sure, no end of liberty," rejoined Lawless; "what are you laughing at?—my legs!—They are very comfortable, I can tell you, if they're not over ornamental; never mind about attitude, let us get on to business, I want to know what I'm to do."

"The first thing is to find out a good word," returned Coleman.

"What do you say to Matchlock?" inquired I.

"You might as well have Blunderbuss while you are about it," was the reply. "No, both words are dreadfully hackneyed; let us try and find out something original if possible."

"Eh? yes, something original, by all means; what do you say to Steeple chase?" suggested Lawless.

"Original, certainly," returned Freddy; "but there might be difficulties in the way. For instance, how would you set about acting a steeple?"

"Eh? never thought of that," rejoined Lawless; "I really don't know, unless Oaklands would stand with a fool's cap on his head to look like one."

"Much obliged, Lawless; but I'd rather be excused," replied Harry, smiling.

"I've got an idea!" exclaimed I.

"No! you don't say so! you are joking," remarked Freddy, in a tone of affected surprise.

"Stay a minute," continued I, musing.

"Certainly, as long as you and Sir John like to keep me," rejoined Coleman, politely.

"Yes! that will do; come here, Freddy," added I, and, drawing him on one side, I communicated to him my ideas on the subject, of which, after suggesting one or two improvements on my original design, he was graciously pleased to approve. Of what this idea consisted, the reader will be apprised in due time. Suffice it at present to add, that Fanny having consented to perform the part of a bar-maid, and it being necessary to provide her with a lover, Lawless volunteered for the character, and supported his claim with so much perseverance, not to say obstinacy, that Coleman, albeit he considered him utterly unsuited to the part, was fain to yield to his importunity.

For the next few days Heathfield Hall presented one continual scene of bustle and confusion. Carpenters were at work converting the library into an *extempore* theatre. Ladies and ladies'-maids were busily occupied in manufacturing dresses. Lawless spent whole hours in pacing up and down the billiard-room, reciting his part, which had been remodelled to suit him, and the acquisition of which appeared a labour analogous to that of Sisyphus, as, by the time he reached the end of his

(1) Continued from p. 360.

task, he had invariably forgotten the beginning. Every one was in a state of the greatest eagerness and excitement about something—nobody exactly knew what; and the interest Ellis took in the whole affair was wonderful to behold. The unnecessary number of times people ran up and down stairs was inconceivable, and the pace at which they did so terrific. Sir John spent his time in walking about with a hammer and a bag of nails, one of which he was constantly driving in and clenching beyond all power of extraction, in some totally wrong place, a line of conduct which reduced the head carpenter to the borders of insanity.

On the morning of the memorable day when the event was to come off, Mr. Frampton made his appearance in a high state of preservation, shook my mother by both hands as warmly as if he had known her from childhood, and saluted the young ladies with a hearty kiss, to their extreme astonishment, which a paroxysm of grunting (wound up by the usual soliloquy, "Just like me!") did not tend to diminish. A large party was invited in the evening to witness our performance, and, as some of the guests began to arrive soon after nine, it was considered advisable that the actors and actresses should go and dress, so that they might be in readiness to appear when called upon.

The entertainments began with certain *tableaux-vivans*, in which both Harry and I took a part; the former having been induced to do so by the assurance that nothing would be expected of him but to stand still and be looked at—an occupation which even he could not consider very hard work: and exceedingly well worth looking at he appeared when the curtain drew up, and discovered him as the Leicester in Scott's novel of "Kenilworth," the magnificent dress setting off his noble figure to the utmost advantage; while Fanny, as Amy Robsart, looked prettier and more interesting than I had ever seen her before. Various *tableaux* were in turn presented, and passed off with much *éclat*, and then there was a pause before the charade, the grand event of the evening, commenced. Oaklands and I, having nothing to do in it, (Fanny having persuaded Mr. Frampton to undertake a short part which I was to have performed, but which she declared was so exactly suited to him that she would never forgive him if he refused to fill it,) wished the actors success, and came in front to join the spectators.

After about ten minutes of breathless expectation, the curtain drew up, and exhibited Scene 1st, the Bar of a Country Inn:—and here I shall adopt the playwright's fashion, and leave the characters to tell their own tale:—

SCENE I.

Enter Susan Cowslip, the Burmaid (FANNY), and John Shortoats, the Ostler (LAWLESS).

John. Well Susan, girl, what sort of a morning have you had of it? how's master's gout to-day?

Susan. Very bad, John, very bad indeed: he has not got a leg to stand upon; and as to his shoe, try everything we can think of, we can't make him put his foot in it.

[*Extempore soliloquy by Lawless.* Precious odd if he doesn't, for he's not half up in his part, I know.]

John. Can't you, really? well, if that's the case, I needn't ask how his temper is?

Susan. Bad enough, I can tell you; Missus has plenty to bear, poor thing!

John. Indeed she has, and she's too young and pretty to be used in that manner. Ah! that comes of marrying an old man for his money; she's uncommon pretty, to be sure, I only knows one prettier face in the whole village.

Susan (with an air of forced unconcern). Aye, John, and whose may that be, pray? Mary Bennett, perhaps, or Lucy Jones?

John. No, it ain't either of them.

Susan. Who is it, then?

John. Well, if you must needs know, the party's name is Susan.

Susan (still with an air of unconsciousness). Let me see, where is there a Susan? let me think a minute. Oh! one of Darling the blacksmith's girls, I dare say; it's Susan Darling!

John (rubbing his nose, and looking cunning). Well, 'tis Susan darling, certainly; yes, you're about right there—Susan, darling.

Susan (pouting). So you're in love with that girl, are you, Mr. John? A foolish, flirting thing, that cares for nothing but dancing and finery; a nice wife for a poor man she'll make, indeed—charming!

John. Now don't go and fluster yourself about nothing, it ain't that girl as I'm in love with; I was only a-making fun of you.

Susan (crossly). There, I wish you wouldn't keep teasing of me so; I don't care anything about it—I dare say I've never seen her.

John. Oh! if that's all, I'll very soon show her to you—come along. (*Takes her hand, and leads her up to the looking-glass.*) There's the Susan I'm in love with, and hope to marry some day; hasn't she got a pretty face? and isn't she a DARLING? (*Susan looks at him for a minute, and then bursts into tears; bell rings violently, and a gruff voice calls impatiently, Susan! Susan!*)

Susan. Coming, Sir, coming. (*Wipes her eyes with her apron.*)

John. Let the old curmudgeon wait! (*Voice behind the scenes, John!—John Ostler, I say!*) Coming, Sir; yes, Sir. *Sir*, indeed—an old brute; but now, Susan, what do you say? do you love me! and will you have me for a husband? (*Takes her hand.*)

(*Voice.* John! John! I say. Susan! where are you? And enter Mr. Frampton, dressed as the Landlord, on crutches, and with his gouty foot in a sling.)

Landlord. John! you idle, good-for-nothing vagabond, why don't you come when you're called?—eh?

Susan. Oh, Sir! John was just coming, Sir; and so was I, Sir, if you please.

Landlord. You, indeed—ugh! you're just as bad as he is, making love in corners, (*aside.* Wonder whether she does really,) instead of attending to the customers; nice set of servants I have, to be sure. If this is all one gets by inn-keeping, it's not worth having. I keep the inn, and I expect the inn to keep me. (*Aside.* Horrid old joke, what made me put that in, I wonder! just like me—umph!) There's my wife, too—pretty hostess she makes.

John. So she does, master, sure-ly.

Landlord. Hold your tongue, fool—what do you know about it? (*Bell rings.*) There, do you hear that? run and see who that is, or I shall lose a customer by your carelessness, next. Oh! the bother of servants, oh! the trouble of keeping an inn! (*Hobbles out, driving Susan and John before him. Curtain falls.*)

As the first scene ended, the audience applauded loudly, and then began hazarding various conjectures as to the possible meaning of what they had witnessed. While the confusion of sounds was at the highest, Oaklands drew me on one side, and inquired, in an under tone, what I thought of Lawless's acting. "I was agreeably surprised," returned I, "I had no notion he would have entered into the part so thoroughly, or have acted with so much spirit."

"He did it *con amore*, certainly," replied Oaklands, with bitterness; "I considered his manner objectionable in the highest degree. I wonder you can allow him to act with your sister; that man is in love with her—I feel sure of it—he meant every word he said. I hate this kind of thing altogether—I never approved of it; no lady should be subjected to such annoyance."

"Supposing it really were as you fancy, Harry, how do you know it would be so great an annoyance? It is just possible Fanny may like him," rejoined I.

"Oh, certainly! pray let me know when I am to congratulate you," replied Oaklands, with a scornful laugh; and turning away abruptly, he crossed the room, joined a party of young ladies, and began talking and laughing with a recklessness and excitability quite unusual to him. While he was so doing, the curtain drew up, and discovered

SCENE II.—BEST ROOM IN THE INN.

Enter Susan, showing in Hyacinth Adonis Brown (COLEMAN), dressed as a caricature of the fashion, with lemon-coloured kid gloves, noisy-patterned trousers, sporting-coat, &c.

Susan. This is the settin'-room, if you please, Sir.

Hyacinth (*fixing his glass in his eye, and scrutinizing the apartment*). This is the settin'-room, is it? to set, to incubate as a hen—can't mean that, I imagine—p'vvincial idiom, p'wobably—aw—ya'as—I dare say I shall be able to exist in it as long as may be necessary—ar—let me have dinnaar, young woman, as soon as it can be got weady.

Susan. Yes, Sir. What would you please to like, Sir?

Hyacinth (*looking at her with his glass still in his eye*). Hom! pwetty gal—ar—like, my dear, like?—(vewy pwetty gal!)

Susan. Beg pardon, Sir, what did you say you would like?

Hyacinth. Chickens tender here, my dear?

Susan. Very tender, Sir.

Hyacinth (*approaching her*). What's your name, my dear?

Susan. Susan, if you please, Sir.

Hyacinth. Vewy pwetty name, indeed—(Aside. Gal's worth cultivating—I'll do a little bit of fascination.) Ahem! Chickens, Susan, are not the only things that can be tender (*Advances, and attempts to take her hand. Enter John hastily, and runs against Hyacinth, apparently by accident.*)

Hyacinth (*angrily*). Now, fellar, where are you pushing to, oh?

John. Beg parding, Sir, I was a looking for you, Sir, (*places himself between Susan and Hyacinth*).

Hyacinth. Looking for me, fellar?

John. I ha' rubbed down your horse, Sir, and I was a wishin' to know when you would like him fed. (*Makes signs to Susan to leave the room*).

Hyacinth. Fed!—aw!—directly, to be 'su-ar. (*To Susan, who is going out.*) Ar—don't you go.

John. No, Sir, I ain't a-going. When shall I water him, Sir?

Hyacinth (*Aside*). Fellar talks as if the animal wore a pot of mignonette. Ar—you'll give him some wataar as soon as he's eaten his dinnaar.

John. Werry good, Sir; and how about hay, Sir?

Hyacinth (*aside*). What a bo-ar the fellar is; I wish he'd take himself off. Weally, I must leave the hay to your discession.

John. Werry well, Sir; couldn't do a better thing, Sir. How about his clothing? shall I keep a cloth on him, Sir? (*Winks at Susan, who goes out laughing.*)

Hyacinth. Yaas! you can keep a cloth on—ar—and—that will do. (*Waves his hand towards the door.*)

John. Do you like his feet stopped at night, Sir?

Hyacinth. Ar—I leave all these points to my gwoom—ar—would you go?

John. I suppose there will be no harm in water-brushing his mane?

Hyacinth (*angrily*). Ar—weally I—ar—will you go?

John. Becos some folks thinks it makes the hair come off.

Hyacinth (*indignantly*). Ar—leave the woom, fellar!

John. Yes, Sir; you may depend upon me takin' proper care on him, Sir; and if I should think o' any thing else, I'll be sure to come and ask you, Sir. (*Goes out grinning.*)

Hyacinth. Howwid fellar—I thought I should never got wid of him—it's evident he's jealous—ar, good idea—I'll give him something to be jealous of. I'll wing the bell, and finish captivating Susan. (*Rings, Re-enter John.*)

John. Want me, Sir? Here I am, Sir—fed the horse, Sir.

Hyacinth (*waving his hand angrily towards the door*). Ar—go away, fellar, and tell the young woman to answer that bell. (*John leaves the room, muttering, "If I do I'm blessed."*) Hyacinth struts up to the glass, arranges his hair, pulls up his shirt collar, and rings again. Re-enter Susan.

Hyacinth. Pray, Susan, are you going to be mawwled? Susan (*colouring*). No, Sir—a—yes, Sir—I can't tell, Sir.

Hyacinth. No, Sir—yes, Sir—ar—I see how it is—the idea has occurred to you—it's that fellar John, I suppose?

Susan. Yes, Sir—it's John, Sir, if you please.

Hyacinth. Well—ar—I don't exactly please. Now listen to me, Susan. I'm an independent gentleman, vewy wick (*aside*, Wish I was)—lots of servants and carriages, and all that sort of thing. I only want a wife, and, captivated by your beauty, I'm wewolved to mawwy you. (*Aside*. That will do the business.)

Susan. La! Sir, you're joking.

Hyacinth. Ar—I never joke—ar—of course you consent?

Susan. To marry you, Sir?

Hyacinth. Ar—yes—to mawwy me.

Susan. What! and give up John?

Hyacinth. I fear we cannot dispense with that sacrifice.

Susan. And you would have me prove false to my true love,—deceive a poor lad that cares for me; wring his honest heart, and perhaps drive him to take to evil courses, for the sake of your fine carriages and servants! No, Sir, if you was a duke, I would not give up John to marry you.

Hyacinth. Vewy fine, you did that little bit of constancy in vewy good style, but now having welloved your feelings, you may as well do a little bit of nature, and own that, woman-like, you have changed your mind.

Susan. When I do, Sir, I'll be sure to let you know. (*Aside*. A dandified fop! why, John's worth twenty such as him.) I'll send John in with your dinner, Sir. [*Curtains and exit, leaving Hyacinth transfixed with astonishment.*]

SCENE III.—FRONT OF INN.

Enter Susan with black ribbons in her cap.

Susan. Heigho! so the gont's carried off poor old master at last. Ah! well, he was always a great plague, and it's one's duty to be resigned—he's been dead more than two months now, and it's above a month since mistress went to Broadstairs for a change, and left John and me to keep house—ah! it was very pleasant—we was so comfortable. Now if in a year or two mistress was to sell the business, and John and me could save money enough to buy it, and was to be married, and live here; la! I should be as happy as the day's long. I've been dull enough the last week though—for last Monday—no, last Saturday—that is, the Saturday before last, John went for a holiday to see his friends in Yorkshire, and there's been nobody at home but me and the cat—I can't think what ailed him before he went away, he seemed to avoid me like—and when he bid me good bye, he told me if I should happen to pick up a sweet-heart while he was gone, he would not be jealous—what could he mean by that? I dare say he only said it to tease me—I ought to have a letter soon to say when mistress is coming back. [*Enter boy with letter, which he gives to Susan and exit.*] Well, that is curious—it is from Broadstairs, I see by the post-mark. Why, hems me, it's in John's hand-writing—he can't be at Broad-

stairs, surely—I feel all of a tremble. . (*Opens the letter and reads.*) “My dear Seusan, Hafter i left yeu, i thort i should not ave time to go hall the way to York, so by way of a change i cum down here, where I met poor Mrs. who seemed quite in the dumps and low like, about old master being dead, which is human natur cut down like grass, Seusan, and not having a crectur to speak to, naturally took to me, which was an old tho’ humbel friend, Seusan—and—do not think me guilty of hincostancy, which I never felt, but the long and short of it is, that we was married” (the wretch!) “yesterday, and is comin home to-morrow, where I hopes to remain very faithfully your affexionate Master and Mrs.

“JOHN and BETSEY SHORTOATS.”

[*Susan tears the letter, bursts into tears, and sinks back into a chair, fainting—curtain drops.*]

[When we commenced the third portion of this our veritable history, and induced the reader to accompany his Old Companions through certain New Scenes, we announced our intention of rendering it the conclusion of our adventures, and we were sincere in so doing, fully purporting by the end of the last chapter to have had ourselves comfortably shot, married, or drowned (for we trust we are not reserved for hanging), out of the way. But as we unrolled the volume of our past life, and recalled the shadow of by-gone days, old recollections crowded upon us, and our story grew upon our hands till it was impossible to compress it into the limits we had originally assigned it. Shall we, then, be asking too much of our gentle Public, if we beg them to grant one more last appearance to their old favourite, Frank Fairleigh?]

A SLIGHT SKETCH OF MEN AND MANNERS IN LANCASHIRE.

THIS county possesses an amount of interest which cannot be surpassed certainly, and most likely is not to be equalled, by any British province. If we regard it as a mart for the fabrication and sale of textures and fabrics suited to the wants of all climes, and necessary to the convenience of every nation, it is full of interest; but when we find—seeing, as we do, social wants known only to people in the most advanced stages of civilization, anticipated by the co-operation of art and science—the traces, nay, the very types, of manners and habits suitable only to the primeval stages of society, a feeling of astonishment is naturally awakened.

The natives of Lancashire are by nature hardy and robust; of Saxon origin, they maintained to a recent period, the athletic amusements, the language, the hospitality, and, above all, the democratic, or if it may be so termed, the plebeian character of that people. Indeed, their dialect differed almost as widely from that of their neighbours to the north, as it did from that of the Southerners.

Although at the commencement of the present century the manufactures of Lancashire had arrived at such importance as to constitute the leading feature in the commerce of this country, the habits and ideas of the mass of the population yet remained unchanged, or had but slightly degenerated from their pristine simplicity—perhaps we ought to say, from their native barbarism. An unnatural description of labour had not yet reduced the physical power, nor had the

amenities of southern society invaded the coarse habits and savage bearing of the men of Lancashire. Since that period the change in the character of the people inhabiting the towns, especially, has been truly marvellous—wonderful in its kind, and rapid in the development. The rural districts can still furnish specimens worthy of former times, it is true, the very existence of which, when brought into the populous quarters, and placed in juxtaposition to the emaciated and shrunken pigmies of the factory—presenting the very extremes of power and imbecility—show, in a most striking manner, the present anomalous condition of the pursuits, habits, and general capabilities of the working population. But to disregard specific changes, and to adhere to our purpose of giving a few remarks respecting Lancashire manners. Surnames are as little used as possible; the people of a whole district, or the hands employed in a large manufactory, distinguishing and addressing each other by their christian names, preferring, when some more special mark may be necessary, to invent an appellation descriptive of some personal or circumstantial peculiarity connected with the party spoken of, to formally making use of his surname. Consistent in their primitive ideas in this respect, the prefix of *Mister* is seldom given, some of the most wealthy manufacturers in the county being familiarly alluded to by their own workpeople merely by the use of their names, without prefix or appendage; thus the family of the Fieldens, who in wealth may vie with princes, are never spoken of in their own neighbourhood otherwise than as John Fielden, Henry, &c. Formerly, in many parts of the county, surnames were totally disregarded—if they had ever been introduced—one man being distinguished from another of the same name by his particular genealogy, which, indeed, was recounted, whenever, in being spoken of, his simple name was not sufficiently descriptive. Thus, John's father being William, he would be styled Jack o' Bill, to distinguish him from other men of the name of John, who, in like manner, would be known by connecting their own with their father's name. Then John, the son of William, having a son Peter, would by paternity attach his sire's, as well as his own name to the boy's, and so he would be Peter o' Jack o' Bill, and in this manner a string of epithets amounting to perhaps a score would be applied to one individual: this remarkable vestige of Saxon simplicity is not entirely obliterated even at the present day. About fifteen years ago public attention was, in some degree, drawn to this peculiar subject from the following incident. An old man, upwards of eighty years of age, with his son, a powerful man of middle life, occupied a lonely alehouse, situated on a moor in the neighbourhood of Saddleworth; the old man and his son were murdered after a bloody conflict, at noon-day, by five Irish reapers. The circumstances of unusual atrocity which accompanied this deed, together with the audacity of the perpetrators, who made their inhuman attack in the light of day, attracted to the spot numbers of the curious from distant parts of the country, who, in pursuit only of the particulars of the occurrence, gathered astonishing information relative to the manners and customs of the locality. The public-house was called Bill o' Jack's house; Bill was the name of the old man, who inherited it from his ancestor Jack. The younger man, who was butchered with his father Bill, only awaited his parent's demise to add a third name to his

paternal roof; supposing he were named after his grandfather, the new title of the house would have been Jack o' Bill o' Jack's. An anecdote is related of a girl in this district who upon being presented with a letter at her father's door by a messenger who inquired for him as Mr. —, using his surname, returned it with the answer that she knew no such person; an act of forgetfulness imputed to the fact of her rarely, if ever, having heard her father spoken of otherwise than by his christian name appended to those of his progenitors. This circumstance will appear the more singular when it is known that the person referred to was a man of some property and consideration in his neighbourhood; indeed, a man of lower rank in that locality could scarcely have had a letter sent to him.

In this same neighbourhood in particular, and throughout the country, a barbarous mode of fighting prevails, designated, to distinguish it from boxing, (which is rarely resorted to and but little known,) "up-and-down," a very descriptive term, as the one who is thrown may be mutilated and bruised *ad libitum* by his antagonist, whilst on the ground and powerless. These contests, moreover, are subject to no specific rules, feet, hands, and teeth, being the ready agents of war; indeed, the combatants are often supplied with strongly-made boots, well studded at the fore-part with hook-headed nails, for the purpose of using the feet with effect; an approved mode of doing which is, after one of the two is thrown, and whilst he still remains prostrate, for the other to retreat a few paces in order to gain an impetus, when he will rush upon his antagonist, and with his greatest possible force administer a kick, by which, probably, several ribs will be broken, or more serious injuries than fractured bones be inflicted. In the particular locality referred to, one favourite mode of treating the fallen is, "putting the damper in," i. e. throttling, which sometimes ends fatally. At races and fairs, only a very few years since, scenes of the most disgusting description might be witnessed; a couple of men, sometimes boys, stretched on the ground, fighting like dogs, and streaming with blood from wounds inflicted by the teeth, the prostrate position of the brutes precluding the use of the more serious aids, the feet. So frequent and fatal have been these up-and-down fights in former years, that the assizes at Lancaster seldom passed without the trial of some manslaughter case arising out of the destruction of one or more parties at these savage orgies.

Amongst the barbarous sports annually practised at wakes, the baiting of bulls, badgers, and sometimes bears, stood prominent: this cruel pastime was not discontinued until it became illegal, by the passing, a few years ago, of the Act of Parliament against cruelty to animals. I may relate, as characteristic of the scene and the actors, a little colloquy which passed between two friends as they were about to return home from one of these merry-makings. One of the men addressed his companion as follows:—"Mast t' foughten?" (Have you fought?) and receiving the answer, "Now" (No), exclaimed, "Geh thee foughten, and let's goo whoam," (Fight, and let us go home). The advice was followed; the man ran up to a bystander and knocked him down, for the sole purpose of affording gratification to his savage love of violence, without an opportunity for the indulgence of which the holiday would have been spiritless.

The parish of Manchester is of very great extent, comprising not only the towns of Manchester and Salford, but stretching for many miles over the surrounding districts; the ecclesiastical jurisdiction of the collegiate church is, consequently, very considerable. Nor is it a vested power merely that it exercises; it possesses a vital, a sort of traditionary, influence in church matters over the people, especially those living in the more remote districts within the extensive boundaries of its right.

Many of the common people would almost consider

a marriage solemnized in any other than "th' owd church" invalid; this feeling is especially predominant among the country people, who, on occasions of christenings and marriages, flock to its sacred porch, to the total disregard of the numerous new churches, although the latter be in their own immediate neighbourhood.

To apportion a few more minutes to Manchester. As it gradually assumed the position of a metropolis—the capital of the manufacturing district—it became the resort of enterprising capitalists, both foreign and native; and thus, while its population received, as it were, an instantaneous and immense acceleration, the native manners were blended with, and ameliorated by, the more refined usages of the strangers. The very nature of the inducement, which was sufficient to impel men at remote distances to make this their common place of abode, is also a guarantee of their being individually of an enterprising and ambitious spirit, to say the least. The social habits of a particular class have no doubt been greatly modified by Germans, who now constitute a great portion of the whole community.

Besides the circumstance of a number of moving spirits, being, as it were, amalgamated into one vast mind, there is another cause of the sudden development of the intellectual power of Manchester—the articles of trade which it produced were not obtained except by various and most elaborate processes of mechanical skill; occupations so stimulating to the energies of the human mind could not fail to produce effects even on those who, performing an assigned part only, might almost be themselves considered components of the great machine. Such being the fact, we can easily understand how the taste of the community came to show itself in the love of scientific pursuits, and enjoyments which enliven the faculties of the mind rather than please the natural propensities. Thus the institutions, which are at once the wonder of neighbours and the admiration of strangers, came to be established, from which are promulgated those enlarged principles and true notions which characterize not merely the general tone in this important town and district, but even individual undertakings and private views. In those localities where this new state of things is yet to commence, the people are still the uncivilized, the barbarous Saxons they have ever been. More than this, in the very town spoken of there are particular neighbourhoods—whole districts—in which the native manners still prevail; their denizens exist without the influence of this precocious, and yet limited, intellectual dictation. In fact, the dissimilar character of different divisions of the community is particularly worthy of note; on the right hand, we observe knowledge, civilization, refinement; on the other, not merely the absence of these, not merely vulgarity and coarseness, but positive ignorance, violence, and brutality. The transition from Athenian politeness to Gothic barbarism is often sudden and complete, and sometimes without there being any great disparity in the rank or station of the individual, or wealth of the class, in which this difference may be

(1) Amongst the various chapels in this venerable edifice, formerly appropriated to their respective founders, as peculiar places in which to worship, [and as the burying-places of themselves and their descendants, is one belonging to Sir Thomas Joseph de Trafford, of Trafford Park, near Manchester, a Roman Catholic gentleman, whose arms are emblazoned on several windows in the church. Although this chapel has been incorporated with that portion of the church applied to the use of the parishioners generally, it is still the property of the Trafford family, who now, as in days of yore, bury their dead here. A few years ago, the second son of the gentleman above named died, and was buried under this chapel. The funeral was conducted in rather a remarkable manner. Before the body was removed from the roof of its ancestors a Romish priest said over it the burial-service, as adopted by the Church of Rome; and on the arrival of the coffin at the church porch it was met by a clergyman, attached to the church, in his canonicals, who, with two Romish priests, attended it to the grave, into which it was lowered in silence.

Madame Malibran, who suddenly expired at Manchester, during one of the musical festivals given there, was, by the desire of the owner, buried underneath the Trafford chapel: subsequently the body was exhumed, and conveyed to the continent.

observed: as certain portions of the labouring population, not yet illumed by the new light, remain almost in their primitive rudeness; so a sacred few of the rich and influential, not necessarily coming, or refusing to be allured within the sphere of this luminary, maintain in all their integrity their provincial manners.

The advanced state of society in Manchester, and the surrounding parts, is attributable to the peculiar circumstances attendant upon the introduction of manufactures into the country. Had this never happened, the people of Lancashire, far from serving as patterns to the whole kingdom, would now have been literally barbarous, and their habits and manners would have been such as to excite the astonishment of their more civilized countrymen. Their brutality would have been of that description which characterized the middle ages, if, indeed, it would not have exceeded the rudeness of the Southerners at any distinguishable epoch in the history of man.

THE MAIDEN AUNT.—No. IV.¹

CHAP. V.

SELF-CONCERN is either intensely obstinate or servilely pliant, according to the breadth of the basis of self-confidence on which it rests. Mrs. Willoughby was so anxious to establish her claim to be considered an untought genius, that she was afraid to oppose Mr. Thornton's opinion, and chimed in with it so readily that she hoped to throw her original view quite into the background. But she was really good-natured, and she therefore proceeded to claim his sympathy for her unfortunate *protégée* on other grounds.

"They are so very poor," she said, "and such deserving people. Quite gentlewomen, too."

Miss Brown rose abruptly. "I would rather go, if you please," she said, in a low tremulous voice, to Edith, her colour varying, and her hands shaking as she tried to fasten her bonnet. "Mamma is only waiting for me at the lodge. I—" Edith cut short her distressing effort at composure by drawing her arm within hers, and leading her at once into the garden.

"The air will do you good," said she, soothingly.

"Oh, pray excuse me—I have been very foolish," returned her companion, hurriedly, "I could not help it. Indeed I have not intended to be conceited, I never wanted to be a genius—only we are *poor*, you see;" and her cheek burned as she spoke the word with painful emphasis, "and they all fancied I had talent; and I have been thinking for a long time that I should be able to save mamma from having to work for her livelihood—and she—" here her assumed strength gave way at once, and hursting into tears, she added, "Oh, how shall I tell her?"

"Let me come with you," said Edith, much distressed. "Pray don't try to restrain your feelings—don't think of me as a stranger. Sit down on this bench—there—(taking her hand) you will be better soon."

"I am better now," faltered she, struggling to repress her sobs. "I will go at once. Pray excuse me. I would rather go alone. You are very kind. I am extremely obliged to you, but I would rather go by myself."

"You shall do exactly as you please," replied Edith, gently, and cordially shaking her young companion's hand, ere she dropped it. "But are you sure that you are able to walk so far as the lodge without assistance?"

"O yes, quite, thank you," answered Miss Brown, with forced cheerfulness and a painful smile. "I am well again, I assure you. It is much better as it is. I shall never be so foolish again," she added, with a dreary, desolate resignation, like one whose life has been robbed of the single hope which gave it light and

colour, and who is trying to believe that the neutral tint of aimless indifference is better than either.

"I wish I could persuade you—" began Edith, with some hesitation.

"No; do not," interrupted she quickly, "do not persuade me, out of kindness, to *believe* again. It is better to know the truth at once; and hope is only another name for disappointment. Good-bye, and thank you very much." She turned as she was leaving Edith, and suddenly, with an averted face and much agitation of manner, said, "Will you forgive my asking you one more favour? Mrs. Willoughby is very kind, and I am very grateful to her, but—" she stopped, seemingly unable to articulate another word.

"You don't wish to see her again," cried Edith, eager to divine her meaning, and save her from the pain of expressing it. "I will take care that she does not follow you."

"Thank you," said the other, half smiling, "but I did not mean that."

"What then?" inquired Edith.

"Why, she may probably—I am afraid—out of mistaken kindness—she might ask to have those drawings bought—for charity—and, *will* you prevent this?" The last words were spoken with sudden vehemence, and she clasped her hands over her burning face.

"Trust it to me," said Edith earnestly and kindly. "Don't let that idea trouble you for a moment. I will take care that it shall not be done. And now, before you go, have the kindness to give me your address, for I assure you I am not inclined to let our acquaintance end here."

"Thank you, thank you," said the poor girl, once more uncovering her eyes.

"Don't thank me," answered Edith, playfully, "but do as I ask, if you please." She drew forth pencil and paper, and wrote the words which her companion tremulously pronounced, "Alice Brown, 5, West-street, Beechwood, Dorsetshire."

"Beechwood!" cried Edith, "why, that is the name of Mrs. Dalton's place, and that, too, is in Dorsetshire."

"Yes," replied Alice, "that is Beechwood Park. It is four miles from the town of Beechwood."

"Then I shall see you before very long, for I am going to Beechwood in three weeks." And the two girls parted—with what different destinations! Edith's heart sank as in the fulness of her bright and prosperous beauty she stood watching the slow walk of the shabby and drooping figure which had just left her. She involuntarily pictured the meeting at the lodge—the watchful, anxious mother—the agonizing disappointment—the loving attempts at unreal consolation on either side—and the desolate return to the small, dingy, unhome-like room in the sombre street of a third-rate country town. Tear after tear of pure compassion did she wipe from her eyes; but, two little months afterwards she would have encountered all that gloom, and poured forth double those tears, for leave to change places with the poor, neglected, unattractive Alice Brown, if by so doing she could have undone her experience of life as Edith Kinnaird! She was roused from a reverie, in which such thoughts as this certainly had no part, by her brother's voice.

"Tears, Edith? I am glad you have some sympathy to spare for any but the fictitious, sentimental sorrows of your German hero and heroine!"

The taunt seemed peculiarly unkind and undeserved, and Edith was turning resentfully away, but Frank detained her. "Do not go, Edith, I want to talk to you about your friends. Even you must allow that they did not exhibit the fairest side of their characters this morning."

"You seem determined to provoke me, and I don't know what you mean," replied Edith, indignantly. "Mrs. Willoughby behaved with heartless vulgarity; but I do not see what fault could be found with any one else."

"You think, then," answered Frank, "that it is perfectly consistent with courtesy, and sincerity, and christian charity, to ridicule an ignorant and conceited woman to her face; to assist in persuading her she is as clever as she believes herself to be; to act submission and obedience to her in such a manner as to make her absurdity more glaring for the enjoyment of the bystanders."

"I think such self-sufficiency as Mrs. Willoughby's is fair game for anybody's wit," said Edith, somewhat embarrassed.

"Yes, if you take a fair shot at it," replied Frank; "but this was laying a trap, which is never fair. And that Mrs. Dalton—I do not like her at all; and I wish with all my heart, Edith, that you wouldn't make a friend of her. I don't like all this German sentimentalism and unreal nonsense; making women discontented with their homes, and teaching them to think themselves unappreciated angels, whom nobody can understand, and whom nobody is worthy to sympathize with. All that is flimsy—so morbid—so thoroughly un-English."

"You don't know Mrs. Dalton," exclaimed Edith; "you were only introduced to her a fortnight ago, and you have never sought her society, so that you *cannot* know anything of her character. Where is the christian charity, pray, in deciding against her without reason in this manner?"

"But I have reason," retorted Frank, "and I know her quite well enough—that is to say, I should be very sorry to know her better. I know that she is married to a most excellent man, who doats upon her, and that she does not make his home happy, and tries to make the world believe her to be an interesting victim."

"It is *not* true," cried Edith, warmly. "I wonder, Frank, you can believe such stories. I wish you would have a little more consideration, and remember that you are speaking of my dear friend."

"Your dear friend!" repeated Frank, with that sort of sneer which a woman finds harder to bear than the bitterest taunts—a sneer which seems to imply that her feelings are too worthless and unreal even to be discussed. "And as to the stories not being true, I will just ask you one question. Have you not heard her profess that she never was in love in her life?"

"Well," answered Edith, reluctantly, "but you know that may be true—"

"A pretty speech for a married woman to make, whether true or false," interrupted Frank, bluntly; "and to make to her husband's face, too, as I know she does! However, my dear Edith, don't let us talk about her. Seriously, it annoys me excessively to see the manner in which you are flirting—it is not what I like at all: you are making poor Vaughan in love with you again, and you are positively coquetting with Thornton and Delamaine, neither of whom, I do believe, care sixpence for you in their hearts. I am quite sure, to speak plainly, your behaviour is the very reverse of what Everard would like."

There was a tone of authority in this unpleasant speech which rendered it peculiarly galling; moreover, after the unexpected and injudicious attack which Frank had just made on her particular friend, Edith felt less than ever inclined to submission. She replied with glowing cheeks and considerable temper, "I am not a child, Frank, and I assure you, I can judge better what I ought to do than any man—men are no judges of women. And if Captain Everard thinks ill of me, let him speak for himself—he does not seem in a hurry to do so."

These last words were spoken in a low tone of voice and with face averted. They were awkwardly true, and Frank did not quite know how to answer them; he accordingly renewed his attack in another form.

"I wonder you can tolerate the attentions of such a well-known butterfly as Thornton; he was desperately in love with Lady Emily Rivers two months ago, and

to-morrow he will be at the feet of Miss Glamis, the Scotch beauty, who is to be the grand attraction at this ridiculous bazaar. Altogether, Edith, I do hope you will be on your guard at this bazaar, and not make yourself conspicuous."

Edith had recovered her temper, though not her equanimity, and she answered with a laugh,—

"Oh, my dear foolish brother, please don't agitate yourself into a virtuous fever about poor innocent me, who never flirted in my life. I shall have to put you on a turban and introduce you everywhere as my *chaperon*."

"Well, Edith," said Frank, sullenly, "a joke is not a reason."

"No, nor a solemn speech either," retorted she; "at least I'm sure it is often the most unreasonable nonsense in the world. The truth is," added she, as if speaking gravely to herself, "he is getting very uncomfortable because he has got nobody to flirt with himself, and so he must needs try to find out flirtations in other people. Never mind, Frank, dear, I'll take good care to occupy Mr. Thornton to-morrow, and you shall have Miss Glamis all to yourself."

Frank *would* not smile.

"You are trying to provoke me, Edith," said he, "but it won't do."

"Won't it really?" replied Edith. "Now, do you know, I thought it was doing very well."

The colour rushed into his face as he exclaimed with vehemence,—

"I do believe there was never a woman in the world who was not a thorough coquette at heart, and who did not love teasing better than anything else."

"And with that pretty sentiment, which must vindicate with every woman your claim to be judge and adviser-general of the sex—I leave you," returned Edith, forcing a laugh as she ran into the house.

Edith's pride was roused and her temper irritated. She felt all the injustice of her brother's remarks too keenly to feel the justice of them at all. If there was a latent spark of real coquetry in her heart it was roused by his most unwise and taunting assertion that "Mr. Thornton did not care sixpence for her." She felt, moreover, as she had said, that she was no longer a child, and that he was treating her as though she were one. She resolved to show her independence, and she felt secretly certain that Miss Glamis would not attract Mr. Thornton from her side at the bazaar on the following day. She told herself that she was *not* flirting—that she was only legitimately enjoying herself—that Lord Vaughan was *not* in love with her, and that Mr. Thornton and she were only forming a friendship. When she thought of her brother's strictures on Amy Dalton, she could not contain her indignation. "It shows clearly," thought she, "how determined he is to find fault with everything that I do, and it would be quite weak to give way to it. But it is not like my own dear Frank—it is quite unkind. I know what I will do. I will tease him thoroughly to-morrow morning, by way of a little innocent revenge, and then I will talk to him afterwards and coax him, and make him see that he has been foolish, and that I don't deserve all these terrible denunciations."

Such was the satisfactory result of Frank Kinnard's judicious lecture; such the mood in which Edith went to her stall at the fancy bazaar!

And where was Philip Everard? And what was he thinking? It is time to inquire.

THE fountain of content must spring up in the mind; and he who has so little knowledge of human nature as to seek happiness by changing any thing but his own disposition, will waste his life in fruitless efforts, and multiply the griefs which he purposes to remove.—*Johnson*.

Evening.

DRAWN BY G. DODGSON, ENGRAVED BY EDWARD DALZIEL.

'Tis evening ; clear a-down the dale
 The vesper bell is pealing,
 While softly on the listening ear
 Its silvery notes are stealing.
 The dying sunset's latest ray
 Gilds with a parting glory
 The limbs of old ancestral trees,
 Shaded with lichens hoary.
 The weary labourer homeward wends
 While, his return to greet,
 The merry laugh of childhood lends
 Its joyous tones and sweet.—*From an unpublished Poem by M. E.*

TO OUR READERS.

" 'Tis not in mortals to command success :
But we'll do more, Sempronius,—we'll deserve it."

Calo, Act I. Scene 2.—sub fin.

It is now two years since with timid step and down-cast eyes, we, like a bashful *débutante*, made our first appearance upon the stage of Literature, and appealed to the reading public for support and sympathy, animated by the hope that we should be found to have that within us which might eventually succeed in winning their approbation. Since that time we have appeared before them in many *parts*, which (our bashfulness having in great measure worn off) we venture to say must, when viewed collectively, speak *volumes* in our favour. We have carefully studied each of these parts, read and re-read them, corrected all faults that we were able to discern in them, added such illustrations as our *plate* might dictate, and on all occasions endeavoured so to act, as to do full justice to the language and sentiments of the various Authors who have composed our parts for us. Nor have we been disappointed in our expectation; even in the beginning of our career, ere our ingenuous timidity had departed, in the days when a frown would have chilled the life-blood in our veins, an indulgent Public received us with smiles of approbation, and the sunshine of their favour rapidly increased our circulation. But with our success our ambition has kept pace, our desire for approbation grows by what it feeds on, and we are determined if we are to be a star to become one of the first magnitude. Addressing ourselves to none of the minor sympathies of class, we act solely with a view to improve, while we endeavour to interest and amuse, the public generally; we would fain have all the world, not a stage, but an audience.

To drop metaphor, however, and condescend to plain English, we must trespass on the reader's patience while we remind him of the principles with which we commenced our undertaking, and, pointing out to him how by a steady adherence to them we have attained the high position we now hold, call his attention to the exertions we are about to make, to carry out these principles still more fully, and explain to him our reasons for believing our efforts will be rewarded by a success more brilliant and complete than any we have yet achieved. The object which we originally proposed to ourselves, and which we have hitherto kept steadily in view, was to provide a work of sufficient intrinsic merit, alike in the literary matter with which its pages were furnished, as in the illustrations which embellished them, to ensure its popularity with the upper and middle classes of society at a price which should place it within the reach of the many whose store is to be reckoned by pence instead of pounds.

The expenses attendant upon an attempt of this nature are of a magnitude scarcely to be conceived by any one not accustomed to the details of literary transactions, and our subscribers had to be counted by tens of thousands ere we could feel anything like a certainty of the success of our experiment: however, it might truly be said of us, "we lisp'd in numbers and the numbers came;" fortune usually smiles on those who court her favours boldly, or, to adopt the style of an illustrious Mosaic-Arabian Contemporary, "first-rate *articles* at reduced prices" will always meet with the patronage of an enlightened public.

At the end of two years, however, with a circulation already surpassing our most sanguine expectations, and rapidly increasing, with favourable notices appearing in the columns of most of the leading journals throughout the kingdom, and with a staff of contributors combining an amount of talent not to be exceeded by that of any periodical of the day, the success of our undertaking is no longer problematical, and we gladly avail ourselves of this opportunity of expressing our gratitude to the public for the kind patronage they have bestowed upon us.

Thus much for the past: we will now say a word or two of our arrangements for the future. In accordance with the wishes of a large majority of our subscribers we propose to discontinue the dark heading at the commencement of the weekly numbers; which will enable us to give the illustrations for the future the full size of the page, while it will add very materially to the effective appearance of the volume: moreover, in order to do thorough justice to the talents of the very eminent artists and engravers whose valuable assistance we have been fortunate enough to secure, we have determined no longer to print at the back of the engraving. Amongst these we are proud to reckon the names of,—

ARTISTS.

A. ELMORE, Esq. A.R.A.
E. FROST, Esq. A.R.A.
H. K. BROWN, Esq.
G. DODGSON, Esq.
W. F. TOPHAM, Esq.

ENGRAVERS.

MR. G. DALEINK.
MR. E. DALZIEL.
MR. JAMES COOPER.

These improvements will enable us to present our Subscribers with illustrations of a style and character hitherto unequalled, and which will set competition at defiance. When we add that our staff of contributors has received very valuable reinforcements; that we have made arrangements with the talented Authoress of the "Maiden Aunt," to continue the interesting sketches of domestic life which, under that title, have from time to time enriched our pages, and to contribute more largely than we have hitherto been able to prevail upon her to do; that we hope to present our readers with some curious and original matter relative to our possessions in India from the pen of a well-known popular writer on that remarkable country; that a marked improvement will be perceptible in the poetical department, as well as decided alterations for the better in the printing and general getting-up of the Magazine, and that the Author of "Frank Fairlegh" has consented to undertake the duties of Editor; we trust that we shall have established a claim on the public for support and encouragement, which we cannot for a moment doubt will be met with the same kind liberality with which our efforts in their service have always hitherto been received, and which will more than recompense the heavy calls on our exchequer which our determination to secure talent wherever it could be found has occasioned. And with a modest confidence that our forth-coming volume will more than realize the promises we have held forth, we make our bow, and take a very respectful farewell of our readers till the FIRST OF NOVEMBER.

A PARABLE OF LIFE.

S. M.

A YOUTH had vowed to labour in unfruitful pastures. Heavy was the burthen, comfortless and well-nigh hopeless the toil; the cruel earth brought forth thorns and brambles under his diligent hands, and each seed that he dropped withered ere it had strength to grow up. There was no shelter from the burning noon-day sun; for it was a land without trees, and the few saplings which he had planted were sickly and miniature, and it seemed hard to wait till their puny shade should acquire breadth and richness, as most likely they too would die early. And as there were no trees, so likewise were there no birds; for those sweet and gentle ones could not live without a nest and a covering; neither was there any water to refresh the parched and splitting ground. So all the kindly melodies of Nature were mute, and the low howl of the wandering wolf, as it came upon the midnight blast, seemed but the fit utterance of the spirit of the place. The soul of the youth was very desolate, and he had no heart to work. He prayed for blindness and deafness, but the hateful tangle of poisonous herbs was still before his eyes, and the voice of the prowling beast still rang in his ears. Then he prayed that his vow might be taken from him, but there was no answer. And the seeds were ready for sowing, and the plough was prepared for his hand, but how should the seeds develope in a soil which gave no nourishment, and of what avail was the plough save to show him that the depths were as unfruitful as the surface?

And, behold, afar off there was a mountain, and the sides of it were steeped in sunlight. He could see that they were soft and green with abundance of verdure; a thousand colours danced in the sunbeams, as a thousand flowers shook their sweet bells in the morning air, and their fragrance reached even to him, and seemed to invite him to go among them. There was the grateful coolness of spreading trees and the soft hum of stealing waters; there the very winds became music, because they were full of the strains of the wood-choristers. There the grain seemed to spring up into waving corn, almost as it was committed to the earth, and if tares or thorns were among it they were not visible from so great a distance. While in the field where the hapless youth was set to labour, the good plants that were really struggling into life were so few and so scattered, that he could not discern them among the abundance of evil; or, if he did see them, they gave him little comfort, for he believed that they would perish ere they attained their full strength. Then he began to think that he would forsake the barren pastures and go to toil where he might find a reward. "Woe is me!" said he, "wherefore am I thus afflicted? I would give my life for the earth if I could make it fruitful; but it is waste to plough and sow where the soil has no capacity for giving nurture. Martyrdom is but another name for suicide, unless the cause sanctify the martyr. I will arise and depart."

And he arose and would have moved away, but it

seemed as though an invisible arm detained him, and though he felt that he could shake it off, an unheard pleading prevented him; as though by so doing, he would inflict some grievous wound. He turned and moved in another direction, but the same unseen obstacle checked his steps. Then he stood still and marvelled; and his eyes were opened, and he saw that around him there was a bright circle drawn, and within the circle stood an Angel with a sorrowful face and loving eyes. When he moved, the circle moved too; and when he touched the edge and strove to cross it, then came the invisible difficulty, and he kept within the edge. He saw, moreover, that when he moved, the Angel moved too, with averted face and deprecating gesture, in an opposite direction, as though about, but unwilling, to leave him. But at the edge of the circle the Angel paused also, and seemed unable to cross it, and returned to him again. And a voice said in his ears, "In a far, quiet place, there is one praying for thee, and that prayer is the bright circle. Thou canst cross it if thou wilt, but it is hard for thee to do so. And till thou cross it, not even thy sins can separate thee from the Angel whom that prayer has encircled in its silver line and so preserved for thee!"

Then he felt greatly comforted, and took courage. And he went manfully to labour, under the eyes of that Angel, and by the soft light of that prayer, which seemed to grow brighter by night. And lo! when the morning arose he found a small stream, breaking with difficulty out of the bosom of the stony earth. And he hewed a basin for it, with pain and trouble, and gradually it became a fountain, softening the ground and feeding the weak and weary verdure. And who shall say, that in the end the barren valley shall not be fairer than the far-off mountain? For the labourer has not refused to see the growing beauty of the one, because he is too distant to discern the hidden evils of the other. He is working, in fear truly, but also in hope; and the tiny buds are beginning to pierce the soil, and the faded leaves are resuming their freshness; and there is even a solitary bird on the sapling which grows beside him, to cheer him by its notes of timid sympathy, and its whispered promise, that here it will build its nest; and as the grove arises, a nation of songsters shall arise to people it. He has not forsaken his work, therefore for him there shall be rest in the end.

ON EQUALITY OF PUNISHMENTS.

T. N. H.

It was not many months ago that his worship of Puddledock, a very incarnation of justice, impartiality, and other legal qualifications, did sit upon his awful bench, where, for long time, he had been quite a terror to pickpockets, beggars, and other rebels against our admirable Constitution, and then and there did try, and condemn, and sentence a veritable nobleman. It was a decided occasion; in fact, an event. Justice had in old days gone by been represented with a bandage over her eyes, for fear, as it may be presumed, of accidents, but latterly it had been thought, whether rightly or wrongly it skilleth not to decide at this present, that, like the specimens of mesmeric clairvoyance, she had

managed to squint out sideways. Now, however, the majesty of law was to be vindicated. After-ages were to learn that partiality attaches not to a British station-house,—that the same even-handed justice was scrupulously administered to rich and poor. An opportunity, a decidedly grand opportunity, had offered. The scion of a noble house had, in the exuberance of *spirits* (forgive the pun, dear reader,) assaulted a policeman. A little while before a poor man had done likewise, and had been punished with imprisonment. Why should the one pay a fine merely, while his poorer brother had been confined in durance vile—one of the same flesh and blood, one of the great human family, as orators are wont to say,—one of the same country, and entitled to the same protection and liberty? Would this be just and right, that the poor man should rot in the common dungeon, in manacles and chains, while my Lord puts his hand into his pocket, pays his fine, which he would not miss if he lost it, and goes home to his fashionable amusements, little the worse for his morning's adventure? Forbid it, genius of Rectitude—forbid it, Minos, Aramantus, Solon, and Cerberus, whose very nature, the dog, abhorred *one-sidedness*. Let it never be said that here, in the centre of enlightenment, the fountain of justice was polluted! No. Let Europe and the civilized world know for certain, that if my Lord shall violate the laws as Jack the costermonger hath violated them, he shall be punished with the same punishment, and share the same fate. So cogitated the worthy magistrate, and so did his worship proceed to sentence. Lord — goes to prison for a week or so, enjoys the company of Jack the costermonger, and of others similarly circumstanced, and the judge is landed in newspaper, penny magazine, in tavern, and beer-shop, to his heart's content.

If such be the determined judgment of thy mind, dear reader, here stop; for the story is a very nice one, and we have no wish to disturb respectable prejudices. We have no sympathies with the noble culprit, and are only using him as a peg whereon to hang a word or two about equality of punishments. Yet if thou thinkest invincibly as the worthy magistrate did, and as the still more worthy press do, here pause, and content thyself, for we shall only disturb thy equanimity, and go rather to some magazine or paper which deals in politics, and will write for thine especial behoof all manner of nice and eloquent things about the rights of the people, and so forth. If thou hast an earnest zeal for the truth, go forward, for this is the sole object of this paper.

Do not, then, at the very outset, dear reader, increase our difficulty by imagining that we are aiming at the destruction of equality in punishments; for in so doing you would greatly misapprehend us, and, what is far more important, would rouse sundry, by no means insignificant difficulties, in your own way. This principle of equality in the dispensation of justice is far too sacred to be thus sacrificed. Its foundations are fixed deep in the most sacred law of Nature; and by no means wise, therefore, would it be to sneer at it, or to denounce the sturdy maintenance thereof, as an entirely popular cry. Indeed, were we to do so, it would not quite succeed, for honest common sense generally manages to find out the right in the end. Therefore, conceive of us as veritable champions of this first sacred principle of right, without which law is not, law cannot be, for it is what Seneca has called it, "the foremost part of equity." Whatever regular system there may be in a code which shuts its eyes to this aforesaid equality, it cannot be called equity, but only might pleasing to act on a fixed plan of its own; for justice recognises, and sacredly preserves, mutual right. It is because this equality is sacrificed and destroyed, that we blame the worthy magistrate; for we cannot be so unjust in our judgment, neither will we be so blind to the conservation of our own consistency, as to deny the noble this same equality which we are demanding for the poor, and, while we

raise somewhat of an outcry for the rights of the commonality, do altogether unjustly to the others. The fact really seems to be, that the worthy magistrates aforesaid, and those who think as he does, are, to speak logically, the victims of an equivocal noun. For there are two kinds of equality, quite distinct each from the other; equality of kind or quantity, and equality of proportion. If punishment is awarded on the principle of the former, injustice will and must, in very many cases, result; the latter, it is here contended, is the natural equality which should be scrupulously maintained. For when it is enforced that there should be equality of punishment for the same offence, it is thereby meant, I suppose, that the punishment should be *equal* as regards the offenders. Now, if actual inequality be produced by scrupulously adhering to identity of punishment, it is obvious that, in the very endeavour to maintain this inviolable principle of law, we are truly most pertinaciously subverting it. Yet we can easily see how that such is the case in certain instances. A woman and a man commit the same offence; for which it may be that public whipping is one of the statutable punishments. Is it not very evident, even to the short-sighted, that by so sentencing the woman as well as the man, a very much severer punishment is, in fact, inflicted on the former? For the natural modesty and tenderness of the sex causes that it would be, in her case, immeasurably heavier. The result, then, is, that unequal punishments would, by such a sentence, be inflicted, and this for the very reason that they were both *the same*. So, again, if a private in a regiment strikes his superior, and an officer commits a like offence, is the same punishment inflicted by martial law? Is the officer sentenced, like the private, to a certain number of lashes? If he were to be thus punished, would the punishment be equal? Certainly not; for the different education of the two makes the degradation in the instance of the officer infinitely greater than in that of the private; and, therefore, so to sentence him would be, in fact, to award a different and severer punishment. And so, again, in the punishment for drunkenness, surely, to fine a poor man five shillings, is an infinitely severer infliction upon him than the same fine would be on his richer neighbour. Identity of punishment in this case involves injustice to the poor man. There are, indeed, cases where the magnitude of the crime destroys all notion of proportion; on somewhat the same principle as Draco's, that crime, at the very best, deserves the heaviest punishment, and nothing severer can be exacted under any circumstances. For instance, in cases of murder or high-treason, death is inflicted on rich and poor alike. Nothing less would be proportionate; nothing more would be possible.

But these are exceptions. In ordinary cases respect should be had to the convicted person, his position, and education; for want of due consideration of which a much heavier punishment might be inflicted than either the law or the administrator of the law had intended. Puffendorf, in his *Law of Nature and of Nations*, (and he is no mean authority), has most clearly enunciated this doctrine. "We must further add this also," he writes, "that all should not be alike visited with the same punishment, and consequently should not by the same means be deterred from the commission of crime. It is easily evident, that as in the general arrangement of punishments, so in the special application of the same to individuals, regard must be had to the character of the delinquent himself, and in it, to those qualities, which, whether from age, sex, position, resources, strength, or the like, may have the power of diminishing, or increasing his sense of the punishment." It is true that in very many cases of delinquency, it is quite possible that the education and consequent knowledge of the parties would greatly aggravate the offence. This was, if I remember rightly, insisted upon in the judgment upon Frost in the matter of the *Charlot* disturbances; and rightly. Yet the very principle involved in such a distinction requires, that a like

consideration should be shown where the result would be exactly the reverse, and the superior position of the party concerned would fairly be allowed to be a palliation. For if the principle of reference to the position and circumstances of the offender be once allowed, it would obviously be quite one-sided to confine its operation to instances where judicial severity would be thereby increased. The particular application of such a rule is of course a very different matter. Grave difficulties are certainly imaginable; but with these we have no business. They belong to legal casuistry. It is enough if the principle itself be admitted. Neither would the dissimilarity of the punishment for the same offence in the case of two persons in different positions, and of different qualities, physical or intellectual, necessarily involve disproportion, as people fondly seem to imagine. Were this the case, of course the question would be at once set at rest. Nor, again, does the fact, that in particular instances, where law has been professedly administered on such principles, manifest inequality of punishment has resulted, at all invalidate our position. For the indefinite accumulation of such instances would only prove the incapacity of the administrator or the defect of the law, unless it could be shown that such one-sidedness was the proper and necessary result of the principle itself, which it is not. For instance, in the example given at the beginning of this paper, if a small fine had been inflicted on the rich person, while the poor man was sent to prison, the punishment would probably have been unequal. The object should have been, so to fine the former as to make the loss to him as severe as the restraint on personal liberty would be to the latter; so that a proportionate equality would have been attained. But, by inflicting the same identical punishment on both, a severe injustice was committed. For it surely never can be pretended that the discomforts of prison fare and prison lodgment are not greater to the nobleman who has fared delicately his life long, than they are to the poor man, who perchance is even better fed and lodged than he was while he was free. Neither can it be the same, that the one should either be compelled to utter seclusion, or must herd with persons with whom he has little in common, as far as mutual intercourse is concerned, while the other is placed in the midst of his fellows and social equals, with the like to whom he has always been accustomed to associate, previous to his imprisonment.

It may be said that the superior attainments and education of the gentleman gave him an advantage over the poor man; and, therefore, that as the offence was greater, because the hindrances to its commission were more numerous, so ought his punishment to have been more severe. In other words, that identity of crime no more necessarily supposes equality of guilt, than identity, equality of punishment. If this be urged, then the principle advocated in this paper is conceded, and the question would resolve itself into a mere consideration of the particular case: for it is thereby allowed, that the punishment is not, ought not to be, equal, and that by making it the same in both cases, it was made purposely unequal, that it might counterbalance the inequality of guilt.

Nevertheless, even in the particular case there is something to be said. For it surely is a mark of strange partiality not to take into account that the policeman is below the nobleman in position and society, his inferior; while he is to the poor man a superior, and as such invested with additional dignity and authority. The natural repugnance, therefore, which the latter had to overcome, must have been very much greater than that which hindered the former; and Puffendorf lays it down as an indisputable canon, that "It in no small degree contributes to a due and proper estimation of offences, to examine how far a person's disposition may have been calculated to lead him to cease from any given crime."

It is evident, therefore, that in this particular case, and in general, the enforcement of identity of punishment for the same offence would be productive of no small injustice. It is as contrary to reason, as it would be in commerce to require arithmetical identity in transfer; though in the latter instance the absurdity would be more apparent. For if for the two shoes of the cobbler, the landlord were required to give two farms, and the jeweller should only receive for his one diamond ring one egg from his poulterer, the confusion and disproportion would be only outwardly more apparent, than that which the same precise identity in judicial punishments would produce. Respect in both cases must necessarily be had to the mutual relation of the two parties concerned, otherwise in the one instance, commerce, in the other, all equity of law, would be utterly annihilated.

And an analogical argument in favour of what has been said, may be drawn from the consideration of rewards. For rewards and punishments follow the same law, and are based on similar principles. Now, surely nothing would be more absurd, nothing more likely to destroy the object of rewards, than to distribute them equally without reference to the position of those who are intended to receive them. In the case of recovery of lost property how differently do people act, when he who has recovered it, and is to be rewarded, is in lowly condition, for what they would do, if he were equal or superior to themselves in rank. That which would be an insult in the latter case, is the proper and expected reward in the former; and, on the other hand, the mere expression of thankfulness, which is all that the gentleman could be offered, would be ridiculed or named as mean and misorly, in the instance of a poor man. The like holds good in those infinitely mightier instances, where the person to be rewarded has saved our life, or that of some near and dear relation. And in the army, how ludicrous a result would ensue from enforcing an identity of rewards! How could an officer consider himself rewarded, if the blue riband or legion of honour, which is offered him, were bestowed on every private who at all distinguished himself. And in division of prize money it would fare ill indeed with the stability of our troops if an equal sum were distributed to officers and men alike. So also how quickly would our titles of nobility lose their estimation, and die a natural death, if every poor or illiterate man, that had done prominent service to his queen or country, should receive one of them. They would be brought very much into the condition of knighthood in the reign of George IV., who is reported to have threatened an unwieldy alderman, who pertinaciously attended his levées, that if the fellow ever came again he would make a knight of him, as sure as he had a head upon his shoulders.

It is indeed curious that the same principle which, in the case of rewards, appears absurd and untenable, should be so strangely advocated in the strictly analogous case of punishments. That there is more cause for the one than for the other, it were indeed difficult to establish; and since, when carefully investigated, the whole reason of things leads us to an opposite conclusion, I think we must attribute its serious maintenance to irrational prejudice, and rank it among those many surprising cases, wherein popular outcry and political cant have been allowed to drown the voice of truth and reason. The first impression, the superficial reasonableness, doubtless deceived the worthy magistrate, and, if it be not treason to say so, the very immaculate press. On the whole it may safely be said, that if this aforesaid functionary of English law had perchance pored over Blackstone, Coke upon Littleton, and other yellow-coated volumes with red labels, a little less, and trusted to his doubtless most sound common sense a little more, he would not have been so blinded, as, involuntarily it may be, to sacrifice the awful purity of justice to the dictation of a miserable and altogether despicable cant. It

behoves all who are the servants of law to remember, that human justice is only venerable so long as it shall show itself to be, as it were, the shadow of God, the expression of His great attribute of justice. Thence does it, must it spring, as from a never-failing fountain. Directly it becomes the slave of popular outcry, and wavers with the breath of man, it is no longer worthy of worship, but sinks into the measureless contempt of the well-judging and the good. Athenian ostracism, when it banished an Aristides, did not exile him, but itself, from the pure air of heaven. The Council of Five Hundred, when it condemned the good Socrates, slew him not, for he lives yet fresh in the hearts of men, but committed a most ignominious suicide. The philosopher it was who condemned his judges, and removed his cause to a higher court, in words full of right and nobleness, confident as he was in his uprightness and honesty of purpose. "I wished," said he, "to make my fellow-citizens happy, and it was a duty I performed by the special command of the gods, whose authority I regard more than yours." And they have even now surely vindicated him from all false witnessings, by the accordant voice of the great human heart.

Of all-disrespectable cant, political cant is well-nigh the worst, and when the voice of law finds expression in such vocabulary, it does itself a most fatal injury. He, who gives sentence, must be, as if the mouthpiece of God, and must do His work, fearful of himself, fearless of consequences. Terrible, yea, terrible indeed, is his baseness of condition, who perverts his office to unworthy ends, and so teaches others to despise that awful attribute of God, of which he is the mischievous exponent.

THE CARPENTER AND THE MAGIC STATUE.

WHEN Titus was emperor of Rome, he promulgated a decree, that the birth-day of his son should be kept sacred, and that no one should presume to do any labour on that day under the penalty of death. The emperor soon found that it was far easier to decree than to obtain the concurrence of his subjects in the decree. The law was continually evaded, and the judges and officers were unable to discover the offenders.

Then said Titus, "Call hither Virgil, the magician."

Virgil came at the emperor's command, and stood in the presence.

"Mighty magician," said Titus, "I have promulgated a law that no one should presume to labour on the birth-day of my son under a penalty of death."

"Thou hast, my lord."

"Know now, that this law is constantly evaded, and that neither my judges nor my officers can discover the offenders."

"What my lord says is true."

"Virgil, we desire you to frame an image; some curious piece of art, which may reveal to us every transgressor of the law."

"It shall be as my lord desires," said the magician.

Not long after this, Virgil constructed a magic statue, and caused it to be erected in the centre of the city. By virtue of its secret powers, it acquainted the emperor with whatever was done amiss. Many and many were the persons convicted through the means of its informations, and no man was safe from its knowledge.

In Rome there lived a poor but industrious carpenter, named Focus, who cared little for the new edict, and every day pursued his laborious occupation.

"Misfortune take thee, thou tell-tale statue!" muttered he, as he lay in bed one night, and thought upon the numerous convictions procured by its means; "tomorrow thou and I must bandy a few words."

As soon as it was day-break, Focus rose, dressed himself, and went to the place where the statue stood:

placing himself immediately before the figure, he thus addressed it:—

"Statue! statue! many of our citizens die daily, by reason of your informations; now take this warning; if you accuse me, I will break your head."

Having thus spoken, Focus returned home to his usual work, though it was the prohibited day. About mid-day the king sent to the statue to inquire whether the law was being duly observed.

"Statue," said the officers, "the emperor demands whether the edict is being strictly observed."

"Friends," rejoined the magic voices; "look up, see what is written on my forehead."

They obeyed the commands of the statue, and saw these three lines on his brow:—

"Times are altered.

Men grow worse.

He that speaks the truth has his head broken."

"Friend," said the statue again, "go tell the emperor what thou hast read."

Now, when Titus heard what was written on the forehead of the statue, he was very wroth, and ordered his guards, and his officers, to watch before the statue, and see that no man did it injury. He bade them also require of the statue the name of the malefactor, and bring him before him directly.

"Declare, O statue!" said the officer of the emperor's guards, "who it is that threatens you."

"It is Focus, the carpenter," rejoined the figure; "he cares not for the edict, and never remits his labour; moreover, he menaces me with a broken head if I disclose his crime."

The guards soon discovered Focus, at work as usual, and dragged him before the imperial presence.

"Man," said the emperor, "what is this that I hear of thee? Not only dost thou break the law, but dost also menace the statue, should it declare thy crime."

"It is even so, my lord; I cannot afford to keep the edict; a holiday to me is so much loss. Every day must I obtain eight pennies, and without incessant labour I have not the means of acquiring them. Holidays are well enough for the rich, but for the poor they are too often a curse."

"Eight pennies, Sir Villain—why eight pennies?"

"Every day throughout the year I am bound to repay twopence, which I borrowed in my youth; two other pence I lend; two I lose, and two I spend."

"Explain this," said Titus, interested in the man's replies.

"Twopence I repay that I borrowed in my youth; when I was a boy, my father expended daily upon me that sum: now he is poor and needs my assistance; therefore I return that which I formerly borrowed."

"Thou dost well."

"Two other pence I lend to my son, for his studies, even as my father did towards me, in the hope that hereafter he will do likewise."

"Again thou dost well; but how dost thou lose twopence a day?"

"I give them to my wife for her maintenance; she is wilful, contradictory, and passionate; these two, therefore, are lost to me on account of her disposition."

"Good again, Focus."

"The two last pennies I spend upon myself in meat, drink, and clothing. With less than this I cannot exist nor can I obtain these eight pennies without incessant and unremitting labour; therefore, O Emperor, a holiday to me is no blessing, but rather a curse; and thy edict I, for one, cannot obey. You now know the truth; judge dispassionately."

"Friend, thou hast well spoken; go labour at thy trade."

Not long after this the emperor and his son both died, and there was no heir to the throne. Then the people remembered the wisdom of the poor carpenter, and tendered to him the empire. He governed as

wisely as emperor as he had lived as a carpenter; and, at his death, his picture, bearing on the head eight pennies, was deposited among the effigies of the departed emperors.

THE ANNULAR ECLIPSE OF OCTOBER 9TH.¹

It is not very long since the attention of the public was largely occupied by the rival claims, and we had well-nigh said the disagreements, of philosophers. The very remarkable coincidence of the totally independent calculations of Le Verrier and Adams having led each of them, within a few weeks, or perhaps days, to one and the same result, and thereby to one of the most brilliant discoveries of modern science, must be fresh in the minds of most men. Happily the warfare of scientific jealousy came speedily to an end, and if the July meeting of the British Association had produced no other good effect, this alone would have been sufficient, that it had afforded England an occasion for welcoming Le Verrier as he deserved, and that Oxford had joyfully witnessed the honours accumulated both upon a foreigner and a member of a rival university.

This recollection revives, naturally enough, when we are looking forward to the most generally interesting of all the phenomena to which the planetary system gives rise—phenomena to which we could not look forward at all, but for the published predictions which result from the very accurate state of astronomical science, so far as it bears upon them. The recurrence of a visible annular eclipse, in any one place, must necessarily be very rare; nor would it be likely to happen in any one life-time that the same tract of country should be traversed by the line in which such a phenomenon might be perfectly seen. It is now more than ten years since an annular eclipse was visible in any part of Great Britain.

In May, 1836, that phenomenon was seen in the northern part of our island, and as many persons then thought it worth while to take a journey (at that time far more tedious than at present) into Scotland, in order to witness it, we hope to be doing acceptable service to at least some of our readers, by giving them the best information we are able, as to when and where the annular eclipse to which we are now looking forward may be seen. We will, in the first place, point out the difference between the track of the eclipse of the present year and that of 1836. The latter was central and annular to positions on our globe, of which a very large proportion, no less than 7000 miles out of a path of 10,000 (speaking very roughly) fell upon the sea, and consequently were devoid of interest, except to such vessels as might happen to be in those situations. The line of the eclipse of this month, on the contrary, traverses principally portions of the globe which are thickly inhabited, and where many of our countrymen reside. Singularly enough, the central line of the eclipse of 1836 passed nearly clear of the north of Ireland, then by a very short distance (as it also does on this occasion) clear of the south.

Generally speaking, the course of the line in which some annular phase was visible in 1836, was as follows:—It commenced about twenty degrees west of the Isthmus of Panama, and crossed that narrow neck of land, the only portion of the continent of America in which it was visible; skirting the north of Ireland, it crossed England centrally about half way between Edinburgh and Dumfries; Perth and Whitley being nearly the northern and southern limits of the annular appearance. Thence passing across Denmark, parts of Poland and Prussia, it ended in the Caspian Sea. In England it was central, or annular, between three and four o'clock

in the afternoon. The noon eclipse was at a point about six degrees west of the Azores.

The general course of the eclipse of October next, (bearing in mind that the day is astronomically October 8, but in ordinary reckoning, the morning of Saturday, October 9, and speaking also of the limits of annular phase) will be—commencing between two and three hundred miles west of Ireland, it will be annular (but not central) to about the southern quarter or third of Ireland. It will traverse the south and west of England, embracing in its northern limits Gloucester and Greenwich. Thence it will cross France (including Rouen and Paris within its southern limits, and Amiens, Lille, and Metz within its northern), Austria, Turkey, Asia Minor, and just before entering the Persian Gulf, will be central and annular at midnoon within the Y formed by the confluence of the Tigris and Euphrates, about twenty-five miles N.W. of Korna. Thence passing down the edge of the Persian Gulf, it crosses Hindostan, entering above Bombay, and keeping above Hyderabad, it crosses the Bengal sea, where it attains its lowest latitude; then, rising again, passes through the Birman and Siamese empires, and ends in lat. 18.29 N., among the mountains which separate this territory from Cochin China. Here it will be central and annular at sunset.

The width of the band enclosed between the northern and southern limits, is about three degrees, measured at right angles to the central line; but in those parts where it is rapidly descending in latitude towards the south-east, if the width be measured along a meridian, it amounts to nearly four degrees. This applies to almost all its course until it leaves the Persian Gulf. During the greater part of the course of the eclipse of 1836 the width of the space between the limits was not above two degrees when measured in the first mentioned manner.

In either case, viz. that of 1836 or of this year, it is but a small portion of this country to which that phenomenon will have been visible, and still smaller in which it will have been seen at all perfectly as a *central* and annular eclipse. A great many of our readers are, no doubt, perfectly familiar with the causes of the several kinds of eclipses, whether lunar or solar, and some are well acquainted with the mode of computation employed to predict the times and places at which these will be respectively visible. To those who wish for ample information on this latter point, the appendix to the Nautical Almanac of 1836 would be a most practically interesting document; containing, as it does, an investigation of the subject; and explaining the mode of computing eclipses adopted at Greenwich, drawn up by Mr. W. S. B. Woolhouse, Head Assistant in the Nautical Almanac Establishment.

There must be, however, some who read our pages to whom the whole subject is a *terra ignota*, and who scarcely bear in mind even the essential difference between eclipses of the sun and of the moon; owing to which, those of the former, though of far more frequent occurrence, are far less often seen in any given place.

An eclipse of the moon, consisting, as we see it, of the passage of the earth's shadow across the moon, may be seen at once by all to whom the moon is then visible; in fact, by nearly an entire hemisphere; whereas, an eclipse of the sun, to be visible at any place on our globe, absolutely requiring as an essential condition that some portion of the moon should be between the observer and some part of the sun, it must clearly be more rarely visible in any one place. Still more strongly does this apply to either a total or annular eclipse of the sun, which can only be such to those places lying on or within certain limited distances of the path formed by a line passing from the centre of the sun through the centre of the moon to the earth's surface; the total eclipse occurring when the moon is so near to the earth that its diameter is equal to, or greater than that of the sun; the annular, when it is so far from the earth as to have a less apparent diameter than the sun,

(1) We are indebted to the Editor of the "Guardian Family Newspaper" for the information conveyed in this article.

and so permit a ring of light to be seen round it: at most a phenomenon of short duration—in these latitudes some six or seven minutes.

A few points in this path are computed, and their positions given in the Nautical Almanac for the whole length of the line. For the sake of our English observers, a larger proportion of points are separately computed for such parts of the path as cross this country.

It seems scarcely worth while to go much into detail as to the places in which a partial eclipse will be visible. The general lines of it are given in the usual map of the Nautical Almanac—we may say, however, that it embraces the whole of Europe, about 1,500 miles wide of the north of Africa, and the greater part of Asia, to about 120 degrees of east longitude. Borneo and the larger islands to the west and south of it, Sumatra and Java, will also see some portion of the partial eclipse.

The following table will complete all that we deem it necessary to present to our readers on this subject. We shall not think our labour lost, if but a few of them should be induced from this account to seek more solid information upon it than our space will permit us to afford to them.

The greatest duration of the annulus will be about 5m. 59s. At Greenwich the eclipse is annular, and

Partial phase begins (Greenwich mean time) October 9	6 14.2 A.M.
Annular	7 27.7
Greatest Phase	7 27.3
Annular phase ends	7 27.9
Partial	8 48.3

At Greenwich, the sun will rise at 6h. 40m. At Cambridge, and Edinburgh, and Dublin, the eclipse is partial, beginning before sunrise.

EXTRACTS FROM NEW WORKS.

THE LABOUR OF BREAKING UP A CAMP.

"The breaking up of a long-standing camp is a scene of no trifling bustle and confusion. The previous day is usually one of considerable trouble to those who have suffered their marching establishment to get out of order; and when it is requisite to replace a camel or a bullock, the new comer, even if found (and that is generally at a ruinous price), not unfrequently evinces the most marked repugnance to tents or bullock-trunks. Yet, however great the difficulty, the peremptory necessity of the habitation being moved before next morning, causes all to be prepared at sunset, either by a reduction of baggage, or increase of cattle, save the more provident campaigners, who rectify such deficiencies without delay. The earliest practicable hours are kept by all off duty, and two hours after sunset the camp (if well regulated) is quiet enough, unless a horse breaks loose and sets the whole brigade in a state of ferment; for all seem to take a deep interest in the progress of any mad animal who tears through the camp, with ropes and pegs flying in wild confusion about his heels. As night advances, even these stray madcaps betake themselves to rest, and the quiet is only disturbed by the hourly tramp of patrols or the challenge of a sentry. This gloom and stillness are suddenly dissipated by the shrill startling blast of the trumpet, wakening all around to consciousness and activity. The loud and continued neigh from the pickets, and the angry remonstrances of the camels, amidst the extensive buzz of human voices and barking of dogs, tell that man and brute are both aware of the time having come for their allotted duties. Sticks and dry grass raked into pyramids are sending forth volumes of smoke in one place, and in another are rising into high crackling fires, round which may be seen groups of dusky figures squatted together, inhaling their morning hookahs, or spreading their

long bony hands to the flames, and listlessly regarding their more assiduous brethren occupied in striking the tents, or fitting loads on the backs of the beasts of burden. But think not, my lazy fire-worshipper, this indolence is unobserved; the eye of the occupant of yonder tent is upon you; he advances softly towards the fire, his arm is raised, and the descending lattice causes a momentary scene of flight and confusion which is immediately succeeded by a zealous attention to duty, proving the salutary force of the *argumentum ad baculum*. Although this is not an orthodox, logical, or even legal argument, it is, nevertheless, frequently used in India, and is generally conclusive. Next morning, the voles, unaccompanied by manual exercise, will produce the desired effect. The loads being packed, and all the tents, save three or four lazy stragglers, having disappeared, the second trumpet sends its shrill echoes through the lines, and gives warning that the treadmill will soon be at work. Beware of that camel's mouth gaping close to your hand in the dark, or he will spoil it for holding a rein or a sabre; and beware the treacherous tent-peg, which lurks in savage gloom for the shins of the unwary. 'It is no use cursing the peg. Why did you not get out of its way when you found it was not inclined to get out of yours?' cries a facetious neighbour, as you stoop to rub the lacerated shin, and narrowly escape being trampled by an elephant, who is hustling off with a few hundredweight of canvases and tent-poles hanging about him. The third trumpet and a cup of boiling coffee generally accompanied each other, if your khansanah belong to the right Dean Swift's breed; and it is no punishment to insist on his drinking it himself—the man would swallow a cup of cayenne and fire, without winking. The troops are formed in dusky masses on their alarm posts; the commanding-officer rides along the line; the word of command is given, and passed down the squadrons; the welcome note for the march is heard, and the tramping of the steeds raises an impenetrable cloud of dust around the column, as we cheerfully turn our backs on Cabul, most probably for ever; the band prophetically striking up, *Ha til mi tulidh*, or something which I mistook for it."—*Military Sketches by a Cavalry Officer.*

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author is printed in Small Capitals, under the title, in Selections it is printed in Italics at the end.]

THE MAIDEN'S CHOICE.

C—.

"My Daughter, look out o'er the far-spreading land,
There comes a rich Baron to sue for thy hand,
With pomp and with pride, and a shining array,
And mickle bright gold hath he brought on the way."

"I cannot look forth the rich suitor to see,
His gold and his glitter are nothing to me;
And deems he with wealth he can capture my heart?
My Mother, dear Mother, oh, bid him depart."

"My Daughter, look out o'er the woodland so wide,
There comes a brave soldier to make thee his bride;
He rideth alone, in his armour of steel,
His sword at his side, and his spur at his heel."

"Good Mother, then let him depart as he came,
For little I reck of his blood-gotten fame;
There's terror before him, there's death in his track—
Such suitor, my Mother, may wend his way back."

"My Daughter, look out from the casement again,
There cometh a lover, sans treasure or train,
Nor weapon he wieldeth, nor armour he wears,
A harp and a scroll are the burthens he bears."

"My Mother, sweet Mother, then bid him come in,
I wis 'tis the youth that my bosom shall win;
The heart of the Maiden resisteth no more,
For lo, 'tis the Minstrel that stands at the door.

"He bringeth a treasure more lustrous than gold,
He beareth the weapon for triumphs untold;
The ore of his thought, and the sword of his song,
More rich than the rich, and more strong than the strong."

CHARADE.

A.

We have furl'd our sails, we have moor'd our bark,
Beneath St. Elmo's fortress dark;
Ave Maria! thy guardian hand
Has brought us safe to Valetta's strand!
Ocean has lifted his waves in vain,
Tho' those howling blasts and that rolling main
Our labouring prow might scarcely stem;
So now our first step on shore we turn,
Where the censer smokes and the altar lights burn
In the church of St. John of Jerusalem.
Where in their marble panoply
The grim old red-cross warriors lie,
We'll thank our Ladie for her aid,—
In the long drawn aisle
Of the Gothic pile
This day our first shall be duly said.

Spread we the onward sail again,
And seek we Syria's sun-burnt strand;
Farewell for a while to the christian strain,
For the Moslem rules in Holy Land.
Yet my second hath witness'd full oft the might
Of christian men for God and the Right,—
She hath heard her ancient turrets ring
With the shout of the Lion-hearted king,
And the rolling tide of the victor Gaul
Broke harmless against her time-worn wall.
On, on to the south, by the wave-worn coast,
And the track of the Corsican's broken host,
To where upon the desert lone,
Skull upon skull and bone upon bone,
The dreary scene of his shameful *whore*
Still justly fires th' indignant soul.
Scene of warrior's broken vow,
Slaughter of a rendered foe,
Not Marengo famed in story
Nor Ansterlitz of brighter glory
May avail to wipe the shame
Of Jaffa from the soldier's fame.

THE BLIND KING.

From the German of Uhlund.

S. M.

Why stand the warriors of the North high on yon wild sea-coast?

What would their blind and grey-haired King, thus mingling with the host?

He leans upon his staff, bowed down with bitter grief and pain,
And calls, till o'er that narrow sea the island rings again:

"Robber, from yonder dungeon-rock restore to me my child!
Her harp and song, so sweet, the weary days of age beguiled.
But rudely thou didst bear her off while dancing on the strand;
It bows my aged head, it leaves on thee shame's lasting brand."

Forth from his rocky cavern then the tall wild Robber sprang;
He swung his giant sword around, and on his shield it rang.
"Thou hast full many warders stout, why did they let her go?
So many warriors serve thee, none for her will strike a blow?"

Yet moved no warrior from the ranks, nor uttered one a tone;
The blind King turned himself around:—"Am I then all alone?"

Then grasped the father's hand the youngest son with pressure warm:

"O let me in the combat prove the strength that nerves my arm!"

"O Son, the foeman's giant strength what valour can withstand?
And yet, right noble pith bespeaks the pressure of thy hand."

Bring then the trusty blade, the theme of many a Scald's high praise;
And should'st thou fall, in yonder flood may end my weary days!"

And hark! the boat rides o'er the sea, with rushing, foaming sound.
The blind King stands with listening ear, and all are still around;

Till sounds of clashing sword and shield come from the other shore,
And battle-cries, and shouts of rage, and Echo's hollow roar.

The old man calls in fearful joy, "Say, what may now be seen?
My sword, I know its warlike tone, it rings so clear and keen."
"The Robber falls! a bloody grave his meet reward shall be.
Hail, best of champions, valiant Prince! hail, spirit bold and free!"

And all is still; the King now stands with listening, anxious ear.

"What comes so fast across the sea? the rush of oars I hear."

"Thy gallant son, with sword and shield, rows swiftly o'er the water,

And with him, in her sun-bright hair, Gunilda comes, thy daughter."

From the high cliff the blind old man shouts "Welcome!" o'er the wave.

"Bliss in my age I now shall find, and honour in my grave.
My son, beside me lay the sword with tone so clear and strong!
And thou, Gunilda, rescued one, sing thou my funeral song."

Miscellaneous.

ANONYMOUS CORRESPONDENCE.

Of all detestable things this is the most odious:—Friend may censure friend, foe may vent his spleen, but let it never be done under the cover, of anonymous writing. It is indeed a sneaking world, a cowardly world, for it kills more from behind a shelter than it dare attack in the open plain: but what dear ties have either been sundered or loosened by this fiend of mischief; what hopes of love blighted, what deeds of charity delayed, what virtues, the most exalting and dignifying to human nature, sullied, by this foul invisible spirit! Friendships over which time could exercise no control,—which distance or poverty could not shake or alter,—have been for ever chilled by suspicion, or completely destroyed by anonymous malice. Neither shall they be wholly guiltless who believe these secret calumniators of a man's character. Truth, be it remembered, requires no covert, no alteration of garb, for how possibly can it assume a lovelier one than its own? Burn, then, these unauthorised epistles; look for the signature before you glance at the matter; and thus this enemy of truth and plain dealing (for such is the anonymous correspondent) will be foiled in his attempt to pervert innocence, and your own bosom will still have the satisfaction of thinking well of those friends and neighbours whom this demon of mischief would destroy.—*Walter Kemp.*

N.B.—A Stamped Edition of this Periodical can be forwarded free of postage on application to the Publisher, for the convenience of parties residing at a distance, 2s. 6d. per quarter.
